§ 22. The procedure of each house in framing and passing bills has already been noted. When a bill has passed one chamber it is sent to the other, and there referred to the appropriate committee. In course of time this committee may report the bill as received from the other house, but frequently an amended or an entirely new measure is presented, which is discussed and enacted on by the second house. When bills passed by the two chambers are not identical, and each persists in its own view, the regular procedure is to appoint a committee of conference, consisting of an equal number of members from the Senate and from the House. These meet in secret, and generally agree upon a compromise measure, which is forthwith adopted by both chambers. If no compromise can be arranged, the conflict continues until one side yields, or until it ends by the adjournment of Congress. After passing both houses, the bill goes to the president, and if approved by him, or not returned by him within ten days, becomes law: if vetoed, it returns to the house in which it originated; and if re-passed by a two-thirds vote, is sent to the other house; and if again passed there by a two-thirds vote, it becomes law without the president's consent.

Congressional Legislation and Finance.

The scope of Congressional legislation has been indicated in the list given of the powers of the national government

[1] This case was that of the impeachment of a senator, and the failure to convict arose from the fact that some of the senators at the time held the now generally accepted opinion that a member of Congress is not subject to impeachment.

(see *ante*, § 15). The most important measures are those dealing with the revenues and appropriations; and the procedure on these matters is slightly different from that on other bills. The secretary of the treasury sends annually to Congress a report containing a statement of the national income and expenditure and of the condition of the public debt, together with remarks on the system of taxation and suggestions for its improvement. He also sends what is called his annual letter, enclosing the estimates, framed by the various departments, of the sums needed for the public service of the United States during the coming year. With this the action of the executive ceases, and the matter passes into the hands of Congress.

Revenue bills for imposing or continuing the various customs duties and internal taxes are prepared by the House committee on ways and means, whose chairman is always a leading man in the majority party. The report presented by the secretary of the treasury has been referred to this committee, but the latter does not necessarily in any way regard that report. Neither does it proceed on estimates of the sums needed to maintain the public service, for, in the first place, it does not know what appropriations will be proposed by the spending committees; and in the second place, a primary object of the customs duties has been for many years past, not the raising of revenue, but the protection of American industries by subjecting foreign imports to a very high tariff. Regular appropriation bills down to 1883 were all passed by the House committee on appropriations, but in that year a new committee—on rivers and harbours—received a large field of expenditure; and in 1886 certain other supply bills were referred to sundry standing committees. These various appropriation committees start from, but are not restricted by and do not in fact adopt, the estimates of the secretary of the treasury. Large changes are made both by way of increasing and reducing his estimates.

The financial bills are discussed, as fully as the pressure of work permits, in committee of the whole House. Fresh items of appropriations are often added, and changes are made in revenue bills in the interest of particular purposes or localities. If the Senate is controlled by the same party as the House, it is likely to secure the acceptance of many of its amendments. The majorities in the two houses then labour together to satisfy what they believe to be the wishes of their party. Important legislation is almost impossible when one of the houses is controlled by one party and the other house by the other.

When finally adopted by the House, the bills go to the Senate and are forthwith referred to the committee on finance or to that on appropriations. The Senate committees amend freely both classes of bills, and further changes may be made by the Senate itself. When the bills go back to the House that body usually rejects the amendments: the Senate declines to recede, and a conference committee is appointed by which a compromise is arranged, usually hastily and in secret, often including entirely new items, and this compromise is accepted with little or no discussion, generally at the end of the session.

Thus it comes that comparatively slight use is made of the experience of the permanent financial officials in the framing of revenue-raising and appropriation bills. There is little relation between the amounts proposed to be spent in any one year and the amounts proposed to be raised, and there is a strong tendency to deplete the public treasury through special grants secured by individual members. These defects have long been felt, but Congress is not disposed either to admit officials to attend its sittings or to modify the methods to which it has grown accustomed. A tariff commission was, however, created by statute in 1909, the reports of which may have some influence on the framing of tariffs in future.

The President. § 23. The executive power of the nation is vested in a president of the United States of America, who holds office during the term of four years. He, together with the vice-president, is nominally chosen by a system of double election through an electoral college, but in practice this system operates merely as a roundabout way of getting the judgment of the people, voting by states.

The Electoral College. The Constitution directs each state to choose a number of "presidential electors equal to the number of its representatives in Congress" (both senators and members of the House of Representatives). Members of Congress and holders of Federal offices are ineligible as electors. These electors (in 1908, 483) meet in each state on the second Monday in January, and give their votes in writing for the president and vice-president. The votes are transmitted to Washington, and there opened by the president of the Senate, in the presence of both houses of Congress, and counted. A majority of the whole number of electors is necessary to elect. If no person have such majority, the president is chosen by the House of Representatives voting by states, and the vice-president is chosen by the Senate. This plan of creating an electoral college to select the president was expected to secure the choice by the best citizens of each state, in a tranquil and deliberate way, of the man whom they in their unfettered discretion should deem fittest to be the chief magistrate of the Union. In fact, however, the electors exercise no discretion, and are chosen under a pledge to vote for a particular candidate. Each party during the summer preceding a presidential election holds a huge party meeting, called a national convention, which nominates candidates for president and vice-president. (See *post*, § 33.) Candidates for the office of elector are also nominated by party conventions, and the persons who are in each state chosen to be electors—they are chosen by a strict party vote—are expected to vote, and do in point of fact vote, for the presidential candidates named by their respective parties at the national conventions. The Constitution leaves the method of choosing electors to each state, but by universal custom they are now everywhere elected by popular vote, and all the electors for each state are voted for on a "general ticket." In the early days the electors were chosen in many states by the legislatures, but by 1832 South Carolina was the only state retaining this method, and in 1868 she also dropped it. Some states also, for a time, chose electors by districts, but by 1832 all had adopted the "general ticket" system. Michigan, however, in the election of 1892 reverted to the "district" system, thereby dividing its electoral vote. Thus the election is virtually an election by states, and the struggle concentrates itself in the large states, where the great parties are often nearly equally divided, *e.g.* the party which carries New York by even a small majority gains all the 39 electoral votes of that state. The polling for electors takes place early in November on the same day over the whole union, and when the result is known the contest is over, because the subsequent meeting and voting of the electors is a mere matter of form. Nevertheless, the system here described, being an election by states, is not the same thing as a general popular vote over the union, for it sometimes happens that a person is chosen president who has received a minority of the popular vote cast.

The Constitution requires the president to be a native-born citizen of the United States, not under thirty-five years of age, and for fourteen years resident in the United States. There is no legal limitation to his re-eligibility any number of times; but tradition, dating from the refusal of George Washington to be nominated for a third term, has virtually established the rule that no person shall be president for more than two continuous terms. If the president dies, the vice-president steps into his place; and if the latter also dies in office, the succession passes to the secretary of state.[1] The president receives a salary of $75,000 a year, besides $25,000 a year for travelling expenses, and has an official residence called the Executive Mansion, or more familiarly the White House.

Functions of the President.—These may be grouped into three classes: those which (1) relate to foreign affairs; (2) concern legislation; (3) relate to domestic administration.

The president appoints ambassadors and ministers to foreign countries, and receives those sent by foreign countries to the United States. He has, through his secretary of state, immediate direction of all negotiations with such countries, and an unfettered initiative in all foreign affairs. He does not, however, enjoy a free hand in finally determining the foreign policy of the government. Treaties require the approval of two-thirds of the Senate, and the foreign affairs committee of that body is usually kept informed of the negotiations which are being conducted by the executive. The power to declare war formally belongs to Congress; but the executive may, without an act of Congress, virtually engage in hostilities and thus bring about a state of war, as happened in 1845–46, when war broke out with Mexico.

As respects legislation, the position of the president is in marked contrast to that of the British crown. While nearly all important measures are brought into parliament by the ministers of the sovereign, and nominally under his instructions, the American president cannot introduce bills either directly or through his

[1] The order of succession, after the secretary of state, is as follows: the secretary of the treasury, the secretary of war, the attorney-general, the postmaster-general, the secretary of the navy, the secretary of the interior—this order to apply only to such officers as "shall have been appointed by the advice and consent of the Senate . . . and such as are eligible to the office of president . . . and not under impeachment. . . ."

ministers. All that the Constitution permits him to do in this direction is to inform Congress of the state of the nation and to recommend the measures which he deems to be necessary. This latter function is discharged by written messages addressed by the president to Congress, the message sent at the beginning of each session being usually the most important; but the suggestions made in these messages do not necessarily or directly induce legislation, although it is open to him to submit a bill or have one drafted by a minister presented to Congress through a member.

More constantly effective is the president's part in the last stage of legislation. His so-called "veto-power" permits him to return to Congress, within ten days after its passage, any bill of which he may disapprove, and, unless this bill re-passes both houses by a two-thirds vote, it does not become law. Most presidents have made use of the veto power sparingly. Jackson, however, as well as Tyler, Johnson and especially Cleveland, employed it pretty boldly. Most of Johnson's vetoes were promptly overruled by the large majority opposed to him in both houses, but the vetoes of all the other presidents have generally prevented the enactment of the bills of which they disapproved.

The domestic executive authority of the president in time of peace is small, because by far the larger part of law and administration belongs to the state and local governments, while the Federal administration is regulated by statutes which leave little discretion to the executive. The power of making appointments to the administrative service would invest him with a vast influence but for the constitutional requirement of securing the consent of the Senate to the more important appointments made. The president is given a free hand in choosing his cabinet ministers; but for most other appointments, whether or not they are by law in his sole gift, the senators belonging to the president's party have practically controlled the selections for offices lying within their respective states, and a nomination made by the president against the will of the senator concerned will generally be disapproved by the Senate. The members of the president's party in the House also demand a share in the bestowal of offices as a price for their co-operation in those matters wherein the executive may find it necessary to have legislative aid. Nevertheless, the distribution of offices under the so-called "spoils system" remains the most important ordinary function of the president, and the influence he exerts over Congress and legislation is due mainly to his patronage.

In time of war or of public disturbance, however, the domestic authority of the president expands rapidly. This was markedly the case during the Civil War. As commander-in-chief of the army and navy, and as "charged with the faithful execution of all laws," he is likely to assume, and would indeed be expected to assume, all the powers which the emergency requires. In ordinary times the president may be almost compared to the managing clerk in a large business establishment, whose chief function is to select his subordinates, the policy of the concern being in the hands of the board of directors. But when foreign affairs reach a critical stage, or when disorders within the Union require Federal intervention, immense responsibility is then thrown on one who is both commander-in-chief of the army and the head of the civil executive. In no European country is there any personage to whom the president can be said to correspond. He may have to exert more authority, even if he enjoys less dignity, than a European king. He has powers which are in ordinary times narrower than those of a European prime minister; but these powers are more secure, for instead of depending on the pleasure of a parliamentary majority, they run on to the end of his term. Although he is always elected as a party candidate, he generally receives, if he shows tact and dignity, abundant respect and deference from all citizens, and is able to exert influence beyond the strict limits of his legal power.

The only way of removing the president from office is by impeachment, an institution borrowed from Great Britain, where it had not become obsolete at the time when the United States constitution was adopted. The House of Representatives may impeach the president. The Senate tries him, and a two-thirds majority is required for conviction. Andrew Johnson is the only president who has been impeached.

The Cabinet and Administrative Officials.

§ 24. There is in the government of the United States no such thing as a cabinet, in the British or French or Italian sense of the word. But the term is regularly used to describe a council of the president, composed of the heads of the chief administrative departments: the secretary of state, the secretary of the treasury, secretary of war, attorney-general, secretary of the navy, postmaster-general, secretary of the interior, secretary of agriculture, and secretary of commerce and labor. Like the British cabinet, this council is not formally recognized by the law, but it is nevertheless accepted as a permanent feature in the government. It is really a group of persons, each individually dependent on, and answerable to, the president, but with no joint policy, no collective responsibility. The final decision on all questions rest with the president; who is solely and personally responsible. Moreover, the members of the cabinet are excluded from Congress, and are entirely independent of that body, so that an American cabinet has little to do in the way of devising parliamentary tactics, or of preparing bills, or of discussing problems of foreign policy. It is not a government, as Europeans understand the term, but a group of heads of departments, whom their chief, though he usually consults them separately, often finds it useful to bring together for a talk about current politics and the course proper for the administration to take in them, or in order to settle some administrative question which lies on the borderland between the provinces of two ministers.

Administrative Departments.

The principal administrative departments are those already named, whose heads form the president's cabinet. The most important are the state and treasury departments. The former has the conduct of foreign affairs and interests, and directs the diplomatic service, but is obliged to keep in touch with the Senate, because treaties require the consent of the latter. It also has charge of the great seal of the United States, keeps the archives, publishes the statutes of Congress and controls the consular service.

The two main functions of the treasury department are the administration of the government revenues and expenditures, and of the banking and currency laws. The secretary has, however, a smaller range of action than a finance minister in European countries, for, as he is excluded from Congress, he has nothing directly to do with the imposition of taxes, and very little with the appropriations for government expenditure.

The department of the interior is less important than in France or Italy, since the principal functions which there belong to it lie, in the United States, within the field of state powers. In the United States the principal matters in this department are the management of the public lands, the conduct of Indian affairs, the issue of patents, the administration of pension laws, of the national census and of the geological survey, and the collection of educational information.

The department of war controls the formerly very small, but now largely increased, army of the United States; and its corps of engineers execute the river and harbour improvements ordered by Congress. The navy department has charge of the dockyards and vessels of war; and the post office department directs the postal system, including the railway mail service. The department of agriculture includes the weather bureau, the bureau of animal industry and other bureaus which conduct investigations and experiments. The attorney-general is the legal adviser of the president, public prosecutor and standing counsel for the United States, and also has general oversight of the Federal judicial administration, especially of the prosecuting officers called district attorneys and of the executive court officers called marshals.

The department of commerce and labor controls the bureaus which deal with the mercantile marine, the lighthouse and life-saving service, commercial statistics, immigration, and the coast and geodetic survey, and the census is also under its charge.

Two commissions not connected with any of the above departments deserve some notice. The inter-state commerce commission, established by statute in 1887, is a semi-judicial, semi-administrative board of five members, with limited powers of control over inter-state railway transportation. The chief duty is to prevent discriminations in freight rates and secret rebates from the published list of charges. Its powers have been much extended by subsequent acts, especially that of 1910. The civil service commission, established in 1883, conducts competitive examinations for appointments to subordinate positions under all of the administrative departments. Some 235,000 posts have now been placed under civil service rules and withdrawn from the category of spoils.

The Federal Judiciary.

§ 25. The Federal judicial system is made by the Constitution independent both of the legislature and of the executive. It consists of the Supreme Court, the circuit court of appeals, the circuit courts and the district courts.

The Supreme Court is created by the Constitution, and consisted in 1910 of nine judges, who are nominated by the president and confirmed by the Senate. They hold office during good behaviour, *i.e.* are removable only by impeachment, thus having a tenure even more secure than that of English judges. The court sits at Washington from October to July in every year. The sessions of the court are held in the Capitol. A rule requiring the presence of six judges to pronounce a decision prevents the division of the court into two or more benches; and while this secures a thorough consideration of every case, it also retards the despatch of business. Every case is discussed twice by the whole body, once to ascertain the view of the majority, which is then directed to be set forth in a written opinion; then again when the written opinion, prepared by one of the judges, is submitted for criticism and adoption by the court as its judgment.

The other Federal courts have been created by Congress under a power in the Constitution to establish "inferior courts." The circuit courts consist of twenty-nine circuit judges, acting in nine judicial circuits, while to each circuit there is also allotted one of the justices of the Supreme Court. The judges of each circuit, acting with or without the justice of the Supreme Court for the circuit, constitute a circuit court of appeals, established to relieve the Supreme Court. Some cases may, however, be appealed to the Supreme Court from the circuit court of appeals, and others directly from the lower courts. The district courts are now eighty in number, each having usually a single justice, rarely two. There is also a special tribunal called the court of claims, which deals with the claims of private persons against the Federal government. It is not strictly a part of the general judicial system, but is a creation of Congress designed to relieve that body of a part of its own labours. A customs court of five judges was created by an act of 1909 for the hearing of cases relating to the tariff.

The jurisdiction of the Federal courts extends only to those cases in which the Constitution makes Federal law applicable. All other cases are left to the state courts, from which there is no appeal to the Federal courts, unless where some specific point arises which is affected by the Federal Constitution or a Federal law. The classes of cases dealt with by the Federal courts are as follows:—

1. Cases in law and equity arising under the Constitution, the laws of the United States and treaties made under their authority;

2. Cases affecting ambassadors, other public ministers and consuls;

3. Cases of admiralty and maritime jurisdiction;

4. Controversies to which the United States shall be a party;

5. Controversies between two or more states, between a state and citizens of another state, between citizens of different states, between citizens of the same state claiming lands under grants of different states, and between a state or the citizens thereof and foreign states, citizens or subjects (Const. art. iii. § 2). Part of this jurisdiction has, however, been withdrawn by the eleventh amendment to the Constitution, which declares that "the judicial power of the United States shall not be construed to extend to any suit in law or equity commenced or prosecuted against one of the United States by citizens of another state, or by citizens or subjects of any foreign state."

The jurisdiction of the Supreme Court is original in cases affecting ambassadors, and wherever a state is a party; in other cases it is appellate. In some matters the jurisdiction of the Federal courts is exclusive; in others it is concurrent with that of the state courts.

As it frequently happens that cases come before state courts in which questions of Federal law arise, a provision has been made whereby due respect for the latter is secured by giving the party to a suit who relies upon Federal law, and whose contention is overruled by a state court, the right of having the suit removed to a Federal court. The Judiciary Act of 1789 (as amended by subsequent legislation) provides for the appeal to the Supreme Court of the United States of "a final judgment or decree in any suit rendered in the highest court of a state in which a decision in the suit could be had where is drawn in question the validity of a treaty or statute for an authority exercised under the United States, and the decision is against their validity; or where is drawn in question the validity of a statute of, or an authority exercised under, any state, on the ground of their being repugnant to the Constitution, treaties or laws of the United States, and the decision is in favour of their validity; or where any title, right, privilege or immunity is claimed under the Constitution, or any treaty or statute of, or commission held or authority exercised under the United States, and the decision is against the title, right, privilege or immunity specially set up or claimed by either party under the Constitution, treaty, statute, commission or authority." If the decision of the state court is in favor of the right claimed under Federal law or against the validity or applicability of the state law set up, there is no ground for appeal, because the applicability or authority of Federal law in the particular case could receive no further protection from a Federal court than has in fact been given by the state court.

The power exercised by the Supreme Court in declaring statutes of Congress or of state legislatures (or acts of the executive) to be invalid because inconsistent with the Federal Constitution, has been deemed by many Europeans a peculiar and striking feature of the American system. There is, however, nothing novel or mysterious about it. As the Federal Constitution, which emanates directly from the people, is the supreme law of the land everywhere, any statute passed by any lower authority (whether the Federal Congress or a state legislature) which contravenes the Constitution must necessarily be invalid in point of law, just as in the United Kingdom a railway bye-law which contravened an act of parliament would be invalid. Now, the functions of judicial tribunals—of all courts alike, whether Federal or state, whether superior or inferior—is to interpret the law, and if any tribunal finds a congressional statute or state statute inconsistent with the Constitution, the tribunal is obliged to hold such statute invalid. A tribunal does this not because it has any right or power of its own in the matter, but because the people have, in enacting the Constitution as a supreme law, declared that all other laws inconsistent with it are *ipso jure* void. When a tribunal has ascertained that an inferior law is thus inconsistent, that inferior law is therewith, so far as inconsistent, to be deemed void. The tribunal does not enter any conflict with the legislature or executive. All it does is to declare that a conflict exists between two laws of different degrees of authority, whence it necessarily follows that the weaker law is extinct. This duty of interpretation belongs to all tribunals, but as constitutional cases are, if originating in a lower court, usually carried by appeal to the Supreme Court, men have grown accustomed to talk of the Supreme Court as in a special sense the guardian of the Constitution.

The Federal courts never deliver an opinion on any constitutional question unless or until that question is brought before them in the form of a lawsuit. A judgment of the Supreme Court is only a judgment on the particular case before it, and does not prevent a similar question being raised again in another lawsuit, though of course this seldom happens, because it may be assumed that the court will adhere to its former opinion. There have, however, been instances in which the court has virtually changed its view on a constitutional question, and it is understood to be entitled so to do.

Results of Constitutional Interpretation.

§ 26. As the Federal Constitution is a short document, which deals very concisely with most of the subjects it touches, a vast number of questions have arisen upon its interpretation in the course of the 122 years which have elapsed since its enactment. The decisions of the Supreme Court upon these questions form a large body of law, a knowledge of which is now indispensable to a mastery of the Constitution itself. By them the Constitution has been so expanded in the points which it expressly treats of, and so filled up in the matters which it covers only by way of implication, that it is now a much more complete instrument than it was when it came from the hands of its framers. Thus the courts have held that, while the national government can exercise only such powers as have been affirmatively granted, it is not restricted in its choice of the methods for exercising such powers as have been granted. From this doctrine there has been derived a conspicuous activity of the national government in such fields as taxation, borrowing of money, regulating commerce and carrying on war. Executive and legislative acts not authorized by the letter of the Constitution have also been allowed to remain unchallenged, and thus precedents have been in fact established.

with the tacit recognition of the courts and the people, through which the sphere of the national government has been enlarged. The purchase of Louisiana from France by President Jefferson is an instance. It may indeed be said that the Constitution as it now stands is the result of a long process of development; and that process is still going on. In 1901 the Supreme Court delivered several judgments in cases arising out of the annexation of Porto Rico, which handled, though they did not fully settle, divers points of novelty and of importance, and still more recently questions of great intricacy affecting the respective legislative rights of the Federal and the state governments have come before it.

§ 27. It is not, however, only by way of interpretation that the Constitution has been developed. A great many matters which it passed over have become the subject of legislation by Congress; and there has also sprung up a large mass of usages regulating matters not touched either by the Constitution or by any express enactment. These usages have in many cases lasted so long and become so generally accepted, that they may be regarded as parts of the actual or (so to speak) "working" Constitution, although of course they could be at any moment changed. Among the matters that are now thus settled by usage the following may be mentioned:—

Development of the Constitution by Usage.

The president practically is limited to two continuous terms of office. The presidential electors are expected to vote for the candidate of the party which has chosen them, exercising no free will of their own. The Senate always confirms the nominations to a cabinet office made by the President.

It may be added that in respect of one matter assigned by the Constitution to the states a momentous change has taken place since the enactment of the Constitution. This matter is the electoral franchise in Federal elections. In 1789 property qualifications were general, but now in all the northern and western states these have been long since abolished, and the electoral suffrage is practically manhood suffrage. In Wyoming, Colorado, Utah, Idaho and Washington universal adult suffrage prevails. Down till 1890 manhood suffrage had prevailed in all the Southern states also (as to some Southern states now see *ante*, § 5). As the electoral suffrage for state legislature elections is also that for Federal elections (including the election of presidential electors), the working of the Federal Constitution has thus been affected without any change in the Constitution itself.

§ 28. Besides these changes which have been brought about by judicial interpretation and by usage, the Constitution has also been altered in the regular and formal way which its own provisions permit (see *ante*, § 14). This has happened four times. Ten amendments were enacted immediately after the adoption of the Constitution itself, in order to meet certain objections which had been taken to it. These may be described as a sort of bill of rights. Another, the eleventh, was enacted in 1794–1798 to negative the construction which the Supreme Court had put upon its own powers in holding that it could entertain a suit by a private person against a state. Another, the twelfth (1803–1804), corrected a fault in the method of choosing the president; and three more (1865–1870) confirmed and secured some of the results of the victory of the North in the War of Secession (1861–65). In 1909 Congress proposed an amendment for enabling the national legislature to impose an income tax. But few amendments pass beyond the first stage of a formal proposal. This is due not merely to the respect of the Americans for their fundamental law, but also to the difficulties which surround the process of change. It is hard to secure the requisite majorities in Congress, and still harder a majority in three-fourths of the states. The obstacles placed in the way of amendment, which are greater than in the case of almost any other Constitution, may be reckoned among the causes which led to the War of Secession.

Amendments to the Constitution.

§ 29. As compared with the cabinet system of Great Britain, of the British self-governing colonies, and of such European countries as France, Italy, Holland and Belgium, the characteristic features of the scheme of the American national government are the following:—

a. The legislature and the executive are independent and disjoined. The executive does not depend upon the legislature, but holds its powers by a direct commission from the people. No member of the executive sits in the legislature, nor can the legislature eject any one from office save by impeachment.

General character of the Frame of National Government.

b. Both the legislature and the executive sit for fixed terms.

c. No method is provided for getting rid of deadlocks, either between the legislature and the executive or between the two branches of the legislature. Should action be needed which cannot be legally taken without the concurrence of these different authorities, and should they be unable to concur, the legal situation must remain *in statu quo* until by a new election the people have changed one or more of the conflicting authorities, and so brought them into harmony.

d. The judiciary holds a place of high importance, because it is the proper interpreter of the will of the people expressed in the supreme law, the Federal Constitution, which the people have enacted.

It will be noted that the structure of the Federal Government is less democratic than that of the state governments. The only posts in the former conferred by popular election are those of the president and the members of the legislature, and while the two houses are a check on each other, the president is a check upon both.

The defects which have been remarked in this system are, broadly speaking, the following: There is a danger that prompt action, needed in the interests of the nation, may fail to be taken owing to a deadlock between legislature and executive, or between the two branches of the legislature. There may be a difficulty in fixing responsibility upon any person, or small group of persons, because cases may arise in which the executive, being unable to act without the concurrence of the legislature, can hardly be blamed for failing to act, while yet it is unable to relieve itself by resigning; while on the other hand the legislature—which consists of two bodies, each of them numerous, and in neither of which are there recognized leaders—contains no person on whom responsibility can be fixed. On the other hand, the characteristic merits of the system may be summed up as consisting in the safeguards it provides against the undue predominance of any one power or person in the government, and therewith against any risk there may be that the president should become a despot, and in the full opportunities it secures for the due consideration of all important measures. It is a system amply provided with checks and balances; it recognizes and enforces the principle of popular sovereignty, while subjecting that principle to many checks in practice; and it is well calculated to maintain unchanged the relation of its component parts each to the other. There has been, in point of fact, no permanent shifting of weight or strength from any one organ of government to any other. At some particular epoch the president has seemed to be gaining upon Congress, at other epochs Congress has seemed to be gaining upon the president. Much depends on the personal qualities of the president and his power of inspiring the people with trust in his courage and his uprightness. When he possesses that power he may overawe Congress, and make them follow, even reluctantly, in the path he points out. Now and then the Senate has been more influential than the House, now and then it has fallen back, at least so far as the confidence of the people in it is concerned. The part played by the judiciary has at some moments been of special importance, while at others it has been little noticed. But, taking the history of the republic as a whole, that equilibrium between the several organs of the government which the Constitution was intended to secure has been substantially maintained.

VI.—*The Party System.*

§ 30. The actual working of the government of the Union and of the governments of the several states cannot be properly understood without some knowledge of the party system as it exists in the United States. That system is, as has been well observed by H. J. Ford,[1] a sort of link between the executive and the legislative departments of government, and thus the policy and action of the party for the time being in power forms a sort of second and unofficial government of the country, directing the legal government created by the Constitution. In no country have political parties been so carefully and thoroughly organized. In no country does the spirit of party so completely pervade every department of political life; not that party spirit is any more bitter than it is in Europe, for in some respects it is usually less bitter and less passionate than in France, the United Kingdom or Austria, but that it penetrates farther into the body of the people, and exerts a more constant influence upon their minds. Party organizations have in the United States a wide range of action, for they exist to accomplish five purposes. Three of these are pursued in other countries also. These three are: first, to influence governmental policy; secondly, to form opinion; and thirdly, to win elections. But the two others are almost (if now not quite) peculiar to the United States, viz. to select candidates for office and to procure places of emolument for party workers. The selecting by a party of its candidates, instead of allowing candidates to start on their own account, is a universal practice in the United States, and rests upon the notion that the supreme authority and incessant activity of the people must extend not only to the choice of officials by vote, but even to the selection of those for whom votes shall be cast. So the practice of securing places for persons who have served the party, in however humble a capacity, has sprung from the maxim that in the strife of politics "the spoils belong to the victors," and has furnished a motive of incomparable and ever-present activity ever since the administration (1829–1837) of President Andrew Jackson. It is chiefly through these two practices that the party organizations have grown so powerful, and have been developed into an extremely complicated system of machinery, firm yet flexible, delicate yet quickly set up, and capable of working efficiently in the newest and roughest communities.

Influence of the Party System upon the Working of the Government.

§ 31. The contests over the adoption of the Federal Constitution by the several states in 1787–1790 brought to the surface two opposite tendencies, which may be called the centrifugal and centripetal forces, a tendency to maintain both the freedom of the individual and the independence, in legislation, in administration and in jurisdiction, of the several states, and an opposite tendency to subordinate the states to the nation, and to vest large powers in the central Federal authority. These tendencies soon arranged themselves in concrete bodies, and thus two great parties were formed. One, which took the name of Republican, became the champion of states' rights, and claimed to be also the champion of freedom. It was led by Thomas Jefferson. The other, the Federalist party, led by Alexander Hamilton, stood for an energetic exercise of the powers of the central government, and for a liberal interpretation of the powers granted that government by the Federal Constitution. The Jeffersonian party has had an unbroken continuity of life, though it has been known since about 1830 as the Democratic party. The Federalist party slowly decayed, and ultimately vanished between 1820 and 1830, but out of its ruins a new party arose, practically its heir, which continued powerful, under the name of Whigs, till 1854, when it broke up over questions connected with the extension of slavery. Very soon thereafter a party, nominally new, but largely formed out of the Whigs, and maintaining many of its traditions, sprang up, and took the name of Republicans. Since 1856 these two great parties, Democrats and Republicans, have confronted one another, including between them the vast majority of the people. After the Civil War, when the questions attending Reconstruction had become less acute, economic discontents gave rise to other smaller parties, such as Greenbackers, Labor party and Populists, and the sense of the harm done by the licensed sale of alcohol evoked a party which became known as the Prohibitionists. Still later the growth of Collectivist views, especially among the immigrants from Continental Europe, led to the formation of a Socialist Labor party and a Socialist party, some of those who had belonged to the Populists associating themselves with these new groups.

Origin and History of the Parties.

[1] *Rise and Growth of American Politics.*

The Democratic party began to form for itself a regular organization in the presidency (1829–1837) of Andrew Jackson, and the process seems to have been first seriously undertaken in New York state. The Whigs did the same; and when the Republicans organized themselves, shortly after the fall of the Whigs, they created a party machinery on lines resembling those which their predecessors had struck out. The establishment of the system in its general form may be dated from before the Civil War, but it has since been perfected in its details.

§ 32. The machinery of an American party consists of two distinct but intimately connected sets of bodies, the one permanent, the other temporary, or rather intermittent. The function of the former is to manage the general business of the party from month to month and year to year. That of the latter is to nominate candidates for the next ensuing elections and to make declarations of party opinion intended to indicate the broad lines of party policy.

Outline of the System of Party Organization.

The permanent organization consists of a system of committees, one for each of the more important election areas. There is a committee for every city, every county, and every congressional district, and in some states even for every township and every state legislature district. There is, of course, a committee for every state, and at the head of the whole stands a national committee for the whole Union, whose special function it is to make arrangements for the conduct of party work at a presidential election. Thus the country from ocean to ocean is covered by a network of committees, each having a sphere of action corresponding to some election area, whether a Federal area or a state area. Each committee is independent and responsible so far as regards the local work to be done in connexion with the election in its own area, but is subordinate to the party committees above it as respects work to be done in its own locality for the general purposes of the party. The ordinary duties of these committees are to raise and spend money for electioneering and otherwise in the interests of the party, to organize meetings, to "look after the press," to attend to the admission of immigrants or new-comers as voters, and generally to attract and enrol recruits in the party forces. At election times they also direct and superintend the work of bringing up voters to the polls and of watching the taking and counting of the votes; but in this work they are often aided or superseded by specially appointed temporary bodies called "campaign committees." These party committees are permanent, and though the membership is renewed every year, the same men usually continue to serve. The chairman in particular is generally reappointed, and is often, in a populous area, a person of great and perhaps autocratic power, who has large funds at his disposal and a regular army of "workers" under his orders.

Party Committees.

The other and parallel branch of the party organization consists of the bodies whose function it is to nominate party candidates for elective posts, whether legislative or executive. (It must be remembered that many executive state, county and city officers are chosen by direct popular vote.) These bodies are meetings of the members of the party resident in each election area. In the smallest areas, such as the township or city ward, the meeting is composed of all the recognized members of the party who are entitled to vote, and it is then called a primary. In the larger election areas, such as a county or city, the number of voters who would be entitled to be present

Party Nominating Conventions.

renders it impossible to admit all, so the nominating meetings in these areas are composed of delegates elected in the various primaries included in the area, and the meeting is called a nominating convention. This is the rule, but in some parts of the South and West nominations for members of the state legislature and county officials, and even for members of Congress, are made by primary assemblies meeting over the entire area, which all the party voters are entitled to attend. Where candidates are to be nominated for a state election, the number of delegates from primaries would be too large, so the state nominating convention is composed of delegates chosen at representative conventions held in smaller areas.

Every registered voter belonging to the party in the local election area for which party candidates are to be nominated is presumably entitled to vote in the primary. In rural districts little difficulty arises, because it is known what citizens belong to each party; but in cities, and especially in large cities, where men do not know their neighbours by sight, it becomes necessary to have regular lists of the party voters entitled to attend a primary; and these lists are either prepared and kept by the local party committee, or are settled by the votes of the persons previously on the party rolls. The composition of these lists is of course a serious matter, because the primary is the foundation of the whole party edifice. Accordingly, those who control the local organizations usually take pains to keep on the lists all the voters whom they can trust, and are apt to keep off those whom they think likely to show a dangerous independence. By their constant activity in this direction, and by their influence over the pliable members of the party, they are generally able to have a primary subservient to their will, which is ready to nominate those whom they may suggest as suitable candidates, and to choose as delegates to the conventions persons on whom they can rely. In this way a few leaders may sometimes be able to obtain control of the nominating machinery of a city, or even of a state, for the local committees usually obey instructions received from the committees above them. (See, as to the details of party machinery, *American Commonwealth*, chs. lix.-lxiv., M. Ostrogorski on *Democracy in England and America*, and Professor Jesse Macy on *Party Organization and Machinery*, 1904.)

The great importance of these nominating bodies lies not only in the fact that there are an enormous number of state, county and city offices (including judicial offices) filled by direct popular election, but also in the fact that in the United States a candidate has scarcely any chance of being elected unless he is regularly nominated by his party, that is to say, by the recognised primary or convention. To control the primary or the convention (as the case may be) of the party which is strongest in any given area is therefore, in ninety-nine cases out of a hundred, to control the election itself, so far as the party is concerned, and in many places one party has a permanent majority.

As the desire to dominate primaries was found to lead to many abuses, both in the way of manipulating the lists of party voters and in the unfair management of the primary meetings themselves, a movement was started for reforming the system, which, beginning soon after 1890, gathered so much support that now in the large majority of the states laws have been enacted for regulating the proceedings at primary nomination meetings. These laws vary greatly in their details from state to state, but they all aim at enabling the voters to exercise a free and unfettered voice in the selection of their candidates, and they have created a regular system of elections of candidates preliminary to the election of office-holders from among the candidates. In most states the voter is required, when he obtains his ballot at the primary election, to declare to which party he belongs, but sometimes the primary is "open" and he may vote for any one of the persons who are put forward as desiring to be selected as candidates. The laws usually contain provisions punishing fraud or bribery practised at a primary, similar to those which apply to the subsequent elections to office. Although political parties were originally mere private organizations, little objection seems to have been felt to giving them statutory recognition and placing the proceedings at them under full official control.

The National Nominating Convention.

§ 33. One nominating body is of such conspicuous magnitude as to need special notice. For the selection of party candidates for the offices of president and vice-president of the United States, there is held once every four years, in the summer preceding the election (which takes place in November) of the president, a huge party assembly of delegates from conventions held in the several states, each state having twice as many delegates as it has electoral votes to cast (*i.e.* twice as many as its Federal senators and Federal representatives). Two delegates are chosen for each congressional district by a district convention, and four delegates for the state at large by a state convention. Each state delegation usually keeps together during the national convention, and holds private meetings from time to time to decide on its course.

When the national convention has been duly organized by the appointment of committees and of a chairman, its first business is to discuss and adopt a series of resolutions (prepared by the committee on resolutions, but subject to amendment by the convention as a whole), which, taken together, embody the views, programme and policy of the party, and constitute what is called its "platform" for the ensuing election. This declaration of principles and plans is sometimes of importance, not only as an appeal to the people in respect of the past services and merits of the party, but as pledging them to the measures they are to introduce and push forward if they win the election. It then proceeds to receive the nomination of various aspirants to the position of party candidate for the presidency. The roll of states is called alphabetically, and each state, as reached in the roll, is entitled to present a candidate. Thereafter a vote is taken between the several aspirants. The roll of states is again called, and the chairman of each state delegation announces the vote of the state. In Democratic conventions a state delegation, when instructed by the state convention to cast its whole vote solid for the particular aspirant favoured by the majority of the delegation, must do so (this is called the unit rule); in the conventions of the other parties individual delegates may vote as they please. If one aspirant has obtained on the first roll-call an absolute majority of the whole number of delegates voting—or, in Democratic conventions, a majority of two-thirds of those voting—he is held to have been duly chosen, and the choice is then made unanimous. If, however, no one obtains the requisite majority, the roll is again called until some one competitor secures the requisite number of votes. Sometimes one or two votings are sufficient, but sometimes the process has to be repeated many times—it may even continue for several days—before a result is reached. Where this happens there is much room for the display of tactical skill by the party managers in persuading delegates who favour one of the less prominent aspirants to transfer their votes to the person who seems most likely to unite the party.

When one aspirant has been duly selected as the party candidate for the presidency, the convention proceeds to choose in the same way a person to be candidate for the vice-presidency. This is a much simpler matter, because the post is much less sought after, and it is usually despatched with ease and promptitude. The two nominees are then deemed to be the candidates of the whole party, entitled to the support, at the ensuing election, of the party organizations and of all sound party men throughout the Union, and the convention thereupon dissolves.

Influences which guide the Parties.

§ 34. It is hardly too much to say that in the United States the parties work the government. The question follows, Who work the parties? The action of the parties depends upon and is the resultant of three factors, which are indeed more or less present in all constitutional representative governments. These are (*a*) individual leaders, who are powerful either by their talents or by the influence they enjoy over the citizens; (*b*) rich men, who can supply the party with the very large sums of money needed for maintaining the party machinery in efficiency and for fighting the elections; and (*c*) the opinion of the mass of the citizens, who, though generally disposed to adhere to the traditions and follow the leaders of the party to which they belong, do, especially in the more educated classes and in the most advanced parts of the country, exert a certain measure of independence, and may refuse to vote for the party candidates if they either distrust those candidates personally or disapprove of the policy which the party seems to be following. It need hardly be said that the relative importance of these three factors varies from time to time. Fortunately that of the second has grown weaker in recent years.

General Results of the Power of the Party System.

§ 35. The national parties have been so pervasive in their influence, and the working of their machinery has formed so important a part of the political history of the United States, that it is necessary here to call attention to the high significance of this element in the system of the Republic. The party system has made nearly all elections, including those for state offices and city offices, the functions of which have, as a rule, nothing whatever to do with national party issues, matters of party strife fought upon party lines. It has disposed voters in state and city elections to support party candidates, of whom they might otherwise have disapproved, for the sake of maintaining in full strength for national purposes the local party organization, and it has thereby become a fruitful source of municipal misgovernment. It has thrown great power into the hands of party managers, because where the strife between the two great parties is keen and the result of a contest doubtful, discipline and obedience are deemed needful for success. It has tended to efface state lines, and to diminish the interest in state issues, and has thus helped to make the nation overshadow the states. (J. Br.)

Bibliography.—*General Secondary Works*: James Bryce, *The American Commonwealth* (2 vols., New York, 1888; rev. ed., 1910) is the most satisfactory treatment of the whole subject; Alexis C. H. C. de Tocqueville, *Democracy in America* (2 vols., a translation by Henry Reeve edited by Francis Bowen, New York, 1898)—the first English edition of this philosophical work appeared in 1835, and it is still suggestive; A. B. Hart, *Actual Government as applied under American Conditions* (3rd ed., rev., ibid., 1908), describes the operation of the various parts of the government and contains bibliographical guides. See also R. L. Ashley, *The American Federal State* (ibid., 1902); and B. A. Hinsdale, *The American Government, National and State* (rev. ed., Chicago, 1895). *State Governments*: The chief source for each state is the *Revised Statutes, General Laws* or *Code*, including the Constitution. There are two official compilations of the *State Constitutions*, one edited by B. P. Poore (2 vols., Washington, 1877) and one edited by F. N. Thorpe (7 vols., ibid., 1909). T. M. Cooley, *A Treatise on the Constitutional Limitations which rest upon the Legislative Power of the States of the American Union* (6th ed., Boston, 1890) is one of the most useful secondary works. In "Handbooks of American Government," edited by L. B. Evans, there is a study of the government of New York by W. C. Morey (New York, 1902), of Ohio by W. H. Siebert (1904), of Illinois by E. B. Greene (1904), of Maine by William MacDonald (1902), of Michigan by W. W. Cook (1905), of Minnesota by F. L. McVey (1901) and of Indiana by E. W. Kemp (1904). See also Lincoln Steffens, *The Struggle for Self-Government; being an attempt to trace American Political Corruption to its Sources in Six States of the United States* (New York, 1906). *The American Political Science Review* (Baltimore, 1907 sqq.) is especially useful for a comparative study of the state governments. For a study of the branches of government, Federal as well as state, see W. W. Willoughby, *The American Constitutional System* (New York, 1904); Emlin McClain, *Constitutional Law in the United States* (ibid., 1905); P. S. Reinsch, *American Legislatures and Legislative Methods* (ibid., 1907); J. H. Finley and J. F. Sanderson, *The American Executive and Executive Methods* (ibid., 1908); W. F. Willoughby, *Territories and Dependencies* (ibid., 1905) and S. E. Baldwin, *The American Judiciary* (ibid., 1905). *Local Government*: The sources are the state constitutions, state laws and town and county reports and records. The best secondary works are J. A. Fairlie's *Local Government in Towns, Counties and Villages* (New York, 1906); and G. E. Howard's *Introduction to the Local Constitutional History of the United States* (Baltimore, 1889) is of use, although the author's theories are questionable. *Government of Cities*: The principal source is the city charters. For a digest of some of these see *Digest of City Charters, together with other Statutory and Constitutional Provisions relating to Cities*, prepared for the Chicago Charter Convention by A. R. Hatton (Chicago, 1906). There is much useful material in *Municipal Affairs*, 6 vols., and vol. v. contains "A Bibliography of Municipal Problems and City Conditions." See also *Proceedings* of the National Conference for Good City Government (Philadelphia, 1894). Among numerous good secondary works are F. J. Goodnow's *Municipal Government* (New York, 1909), *City Government in the United States* (ibid., 1904); *Municipal Problems* (ibid., 1897) and *Municipal Home Rule* (ibid., 1895); J. A. Fairlie, *Municipal Administration* (ibid., 1901); D. F. Wilcox, *The American City: A Problem in Democracy* (ibid., 1904); and *Great Cities in America: Their Problems and Government* (ibid., 1910); H. E. Deming, *The Government of American Cities* (ibid., 1909); Lincoln Steffens, *The Shame of the Cities* (ibid., 1904); F. C. Howe, *The City, the Hope of Democracy* (ibid., 1905); and Charles Zueblin, *American Municipal Progress* (ibid., 1902). *The Federal Government*: For a study of the constitution see the *Documentary History of the Constitution of the United States of America, 1786–1870* (5 vols., Washington, 1894–1905); Jonathan Elliot, *Debates in the Several State Conventions on the Adoption of the Federal Constitution*, &c. (2nd ed., 5 vols., Philadelphia, 1888); *The Federalist*, edited by H. C. Lodge (New York, 1889) or by P. L. Ford (ibid., 1898); *Pamphlets on the Constitution of the United States, Published during its Discussion by the People* (Brooklyn, 1888), edited by P. L. Ford; Joseph Story, *Commentaries on the Constitution of the United States* (5th ed., 2 vols., Boston, 1891); James Kent, *Commentaries on American Law* (14th ed., 4 vols., ibid., 1896); J. I. C. Hare, *American Constitutional Law*, (2 vols., ibid., 1889); E. G. Elliott, *Biographical Story of the Constitution* (New York, 1910); Woodrow Wilson, *Constitutional Government in the United States* (ibid., rev. ed., 1908); and especially important are the decision of the United States Supreme Court, known by the name of the reporter until 1874—A. J. Dallas (1790–1800), Wm. Cranch (1801–1815), Henry Wheaton (1816–1827), Richard Peters (1828–1842), B. C. Howard (1843–1860), J. S. Black (1861–1862) and J. W. Wallace (1863–1874)—and published under the title of the *United States Reports* after 1874. The best collection of *Cases on Constitutional Law* is by J. B. Thayer (2 vols., Cambridge, 1894–1895). *The United States Statutes at Large* are published in 35 vols. (Boston and Washington, 1845–1909), and there is an annotated edition of the *Federal Statutes* compiled under the supervision of W. M. McKinney and C. C. Moore (New York, 1903–1909). J. D. Richardson compiled the *Messages and Papers of the Presidents, 1789–1897* (10 vols., Washington, 1896–1899). The best account of the presidential elections is in Edward Stanwood's *History of the Presidency* (Boston, 1898). For the executive departments the Annual Reports of each and numerous executive documents are useful. Some of the more important secondary works on special topics are: Mary P. Follett, *The Speaker of the House of Representatives* (New York, new ed., 1910); H. B. Fuller, *Speakers of the House* (Boston, 1909); J. A. Fairlie, *National Administration of the United States* (New York, 1907); L. G. McConachie, *Congressional Committees: a Study of the Origins and Development of our National and Local Legislative Methods* (ibid., 1898); Woodrow Wilson, *Congressional Government: a Study in American Politics* (15th ed., Boston, 1900); Jesse Macy, *Party Organization and Machinery* (New York, 1904); M. Ostrogorski, *Democracy and the Organization of Political Parties* (ibid., 2 vols., 1902; the second volume, revised and enlarged, was published in 1910 as *Democracy and the Party System in the United States*); J. A. Woodburn, *American Politics: Political Parties and Party Problems in the United States* (ibid., 1903); Lucy M. Salmon, *History of the Appointing Power of the President*, in American Historical Association Papers, vol. i. (ibid., 1886); C. R. Fish, *The Civil Service and Patronage* (ibid., 1905); W. W. Willoughby, *The Supreme Court of the United States: its History and Influence in our Constitutional System*, in Johns Hopkins University Studies in Historical and Political Science, vol. vii. (Baltimore, 1890); F. A. Cleveland, *Growth of Democracy in the United States: or the Evolution of Popular Co-operation in Government and its Results* (Chicago, 1898); J. A. Smith, *The Spirit of American Government: A Study of the Constitution, its Origin, Influence and Relation to Democracy* (New York, 1907); Albert Shaw, *Political Problems in American Development* (New York, (1907); D. R. Dewey, *National Problems* (ibid., 1907).

VIII.—Finance

The taxing powers within the United States are as follows:—

a. The national government, whose revenue powers are only limited by: (*a*) the provision of the constitution which prohibits all duties on exports, and (*b*) the provision that all direct taxes must be levied in proportion to population—a provision which deprives direct taxes of nearly all their efficiency for revenue purposes.

b. The several states, whose revenue powers are only limited by: (*a*) restrictions in their respective constitutions, and (*b*) the general principle that those powers must not be exercised in such a way as to contravene laws of the United States, or to destroy sources of the national revenue, although a state may prohibit within its borders the sale of liquors, from taxes upon which the United States Treasury derives a considerable part of its receipts.

c. Within each state powers of taxation, to a determinate or to an indeterminate extent, as the case may be, are by the constitution and laws of the state conferred, almost always for strictly defined purposes, (1) upon counties, (2) upon cities, boroughs and incorporate villages, and (3) in nearly all the states, though in widely varying degrees, upon the primary geographical divisions of counties, such as the "town" of New England and the "township" of the Middle and Western states.

The revenues of the several states, and of minor governmental areas within them, are mainly derived from a general property tax, laid directly upon realty and personalty. More than 82% of the tax revenues of state and local governments were thus derived in 1902. The average real rate of assessment was \$0·72 in 1880 and \$0·74 in 1902. The details of this system, which has no other refuge in the civilized world save partially in Switzerland, are remarkable for a most extraordinary diversity in the manner of collection, which practically becomes, however, self-assessment, and an equally extraordinary and general evidence of the crudity and inadequacy of the system, which has been the target of state tax reports throughout the Union for half a century. Nevertheless, only recently have other sources of revenue been largely developed, and the general property tax to a degree abandoned. Thus an inheritance tax was first adopted by Pennsylvania in 1826, yet sixty years later only two states were taxing collateral inheritances. In 1907 there were 34 such, and 19 of these were taxing direct inheritances as well. This is a modern democratic tax, and there are similar tendencies in other taxes. Business taxes are fast increasing, and many special property taxes, these two classes yielding in 1902 7·24% of state and local revenues. The taxation of corporations is recent and rapidly increasing. The same is true of habitation taxes. A beginning has been made with income taxes. Finally, the strain upon municipal finances incident to a realization of civic improvements has called attention to intangible wealth: street railways are no longer taxed as scrap iron but as working systems, with due attention to their franchises; and there is a beginning of the doctrine that the increase in value of unimproved realty constitutes income that should be taxed. The same conditions have made of importance general theories, such as the single tax theory of Henry George, for taxing landed values. All these tendencies, although strongest in municipal finances, are general.

Restrictions upon the taxing power, and unwise classifications of property for taxation purposes, embodied without good understanding in state constitutions, have been a primary obstacle to the development of sound systems of taxation in the several states. A lack of interstate comity, and double taxation of certain classes of property, have also offered difficulties. The progress toward better conditions has, however, been in late years rapid.

A similar restriction placed by the Constitution (art. 1, § 2) upon the power of the Federal government to lay "direct taxes" has been interpreted by the Supreme Court, by a bare majority, in such a way as to make very difficult, if not impossible, the imposition of an income tax (although, it may be added, such taxes had been unanimously held constitutional by the court in earlier decisions, which rested in turn upon interpretations of the constitutional provision just referred to given by the court when it counted among its members justices who had been members of the convention that framed the constitution).

The entire Federal system is the result, partly of constitutional provisions, partly of experience. The Federal authority naturally resorted first to customs duties upon foreign commerce, because in this field it had exclusive authority. It adopted next excise duties on articles produced or consumed within the country, notably liquors and tobacco. These two species of indirect taxes have from the beginning been the main sources of national revenue. At three periods, namely 1800–1802, 1814–1817 and 1863–1871, direct taxes have contributed considerable amounts to the revenue. These taxes included in the last period—that of the Civil War—income and legacy taxes, taxes on commercial transactions, and taxes on persons and property. At times also the proceeds of the sales of public lands have formed an important element of the receipts of government, although it has been the accepted policy to sell such lands to actual settlers at rates so low as to be inconsistent with the object or attainment (relatively) of revenue. Indeed, under the homestead law, large portions of the public domain have been given away to settlers (see Homestead and Exemption Laws), while even larger amounts have been alienated in aid of schools, public improvements, &c., so that the portion sold has not been a third of the total amount alienated. It is possible, however, that the growing consciousness of the necessity of conserving the national resources may lead to a much greater income in the future from the small amounts still remaining in the hands of the national government. In 1908 there still remained unappropriated and unsurveyed, according to the General Land Office, 754,895,296 acres. Of these, 387,000,000 acres were still open to entry, but most of this vast extent consisted, in the opinion of the National Conservation Commission of 1908, of lands either arid or otherwise unsuited for settlement. There were also, in July 1908, about 235,000,000 acres of national forests, parks and other reservations for public use.

Customs duties have been found to be in general the most cheaply collected, the least conspicuous, and least annoying of all taxes. They have, however, never been a stable source of revenue, even during periods when the tariff was constant; and compared with the steady returns shown by the selected articles of the British tariff list this instability has been most extraordinary. Very often their income has been far above the amount needed for all disbursements of the government. In times of war they have of course fallen to a minimum. Thus, in the period 1791 to 1811 their ratio to total government expenditure ranged from 41·6 to 189·6%; during the years 1812–1817, from 17·2 in 1814, when war finances reached their weakest point, to 131·4% in 1817, showing how rapid was their response under the return of peace; in the period 1817–1859 from 29·9% in the crisis year of 1837 to 158·9%; in the period 1860–1869 from 6·5% in 1865, when the government's bonds fell in price to \$50·93 per hundred and the war policy of loans was most desperate, to 84·1%; in the years 1870–1893 from 51·4 to 85%; and, finally, in the years 1893–1909, from 36·9% (in 1898) to 52·7%.

Of the total imports of 1909 47·4%, of a value of \$699,799,771, entered duty free. More than half of these were crude materials for manufactures. The total imports per capita and the duty collected upon them per capita have been as follows since 1885, taking every fifth year: 1885—\$10·32 and \$3·17; 1890—\$12·35 and \$3·62; 1895—\$10·61 and \$2·17; 1900—\$10·88 and \$3·01; 1905—\$13·08 and \$3·11; 1908—\$13·57 and \$3·24.

The attempts of the Federalist party to create a system of internal taxation was a leading cause of its downfall. During the years in which it was in power little more than a tenth of the national revenue was derived from excises, yet they became a national political issue, and the Whisky Rebellion shows how little they were fitted to the nation at that time. The excise system disappeared with the incoming of the Democratic party in 1801. As a temporary necessity such taxes were again resorted to during the war of 1812, and again during the Civil War. In the latter period the excise proved of great richness, and quickly responsive in its returns; whereas the customs were inelastic so long as the war continued. After the war a system of internal revenue was therefore continued.

Of recent years the growing stringency of both national and local finances by enormously increased disbursements has made important the question of the relation of national with state and local taxation. The customs revenue, in its form of high protection, has always had against it a strong free trade sentiment, generally unorganized, and this seems to be growing. The internal revenue is affected by the remarkable spread of the prohibition movement. A considerable and growing public sentiment in favour of the use of the taxing power for the regulation of wealth taken from society demands the introduction into the Federal system of income and inheritance taxes. The last—inasmuch as an income tax that is constitutional can perhaps not be framed—is the only promising source that can give the addition to the Federal revenues that must be needed in case the customs or the excise revenues are reduced.

From 1860 to 1870 the population increased 22·6%, and the net ordinary expenditures of government, not including payments on the national debt, rose 173%; from 1870 to 1900 the corresponding figures (using the official estimated population) were 129% and 408%. The aggregate net ordinary receipts into the United States treasury, from 1791 to the 30th of June 1885, were as follows, in millions of dollars: from customs, 5642; from internal revenue, 3449; from direct taxes, 28; from public lands, 241; from miscellaneous sources, 578; total, 9938. The corresponding figures for the years from 1886 to the 30th of June 1909 were as follows, respectively: 5403; 4618; 0·142; 121; 969.

The expenditures of the government increased steadily per capita up to the opening of the Civil War. The ease with which money was acquired in the war period, the acquiescence of the people, and the influences of extravagance and corruption engendered by the war, opened, at the return of peace, a period of extravagant expenditure that has continued with progressive increase down to the present. A phenomenal growth of both customs and excise revenue has made such expenditures easy. From 1791 to 1886 the aggregate net ordinary expenditures of the government—these expenditures being exclusive of payments on account of principal and interest of the public debt—were as follows, in millions of dollars: for the army, 4563; navy, 1106; military pensions, 900; miscellaneous, 2168; total 8737. The corresponding figures for the period 1887 (June 30) to 1908 (June 30) were: 2003; 1219; 2884; 2790; total 8896.

The average yearly ordinary receipts of the decade 1900–1909, distributed by source, was as follows: from customs, \$280,728,741·30; from excise, \$257,477,356·45; from miscellaneous sources, \$48,736,721·89; total ordinary revenue, \$586,942,919·64 or \$7·11 per capita; revenue from sale of Panama bonds, \$8,730,959·48; from premiums exclusive of Panama bonds, \$397,894·20. The average yearly disbursements during the decade, distributed according to object, were as follows: for civil list and miscellaneous objects, \$143,697,123·09; army, \$130,416,902·62; navy, \$96,722,000·90; military pensions, \$144,856,529·16; Indians, \$12,966,563·00; on account of debt, \$25,632,072·60; total, \$586,942,920.

In 1909 the ordinary receipts were \$637,773,165, or \$7·17 per capita; and the ordinary disbursements \$670,507,889, or \$7·54 per capita. The revenues of all the states, counties, cities and other local governments, plus those of the national government, aggregated in 1879 only \$584,980,614.

Since 1870 the national census office has determined several times the aggregate indebtedness of the national, state and other local governments. The results are stated below, for 1870 and 1902, in round millions of dollars. Sinking funds are deducted.

The national government set out in 1790 with a revolutionary debt of about 75 millions of dollars. This debt continued, slightly increased but without any very important change, until 1806, when a reduction began, continuing until 1812, when the debt was about 45 millions. The then ensuing war with England carried the debt up to 127 millions in 1816. This was reduced to 96 millions in 1819, to 84 millions in 1825 and to 24 millions in 1832, and in the three years following was extinguished. The crisis of 1837, and the financial difficulties ensuing, created indebtedness, fluctuating in amount, which at the beginning of the war with Mexico was about 16 millions. At the conclusion of peace the debt had risen to 63 millions, near which point it remained until about 1852, from which time successive reductions brought it down to 28 millions in 1857. The financial crisis of that year caused an increase, which continued until the imminence of the Civil War, when it rose from 65 millions in 1860 to 91 millions in 1861, to 514 in 1862, to 1120 in 1863, to 1816 in 1864, to 2681 in June, and its maximum (2846 millions) in August 1865. These figures are of gross indebtedness. The amount of the debt per capita of population, less cash in the treasury, was $15·63 in 1800; it fell to $0·21 in 1840; rose again, and in 1865 reached a maximum of $76·98; since when it had fallen by the 30th of June 1908 to $10·76. The amount of the debt outstanding, minus gold and silver certificates and Treasury notes offset by cash in the Treasury, was $1,295,147,432·04 on the 1st of November 1909. Of this amount $913,317,490 was bearing interest.

IX.—Army

The regular army has always been small, and in time of war reliance has been upon volunteer forces (see Army). This was truer of the Civil War than of the War of Independence or the war with Mexico. In the last the numbers of militia and volunteers was but little more than twice, and in the second little more than equal to the number of regulars engaged; while in the Civil War the proportion was as one to twenty. Again, the number of regular troops engaged in the War of Independence (namely, 130,711 men enlisted) was greater, absolutely, than that engaged in the Civil War (126,587). Finally, it is interesting to note that in 1799, when war seemed probable with France, the army was organized with a force of 52,766 men, and during the second war with Great Britain the number was made 57,351 in 1813 and 62,674 in 1814; while the organized strength under the law of 1861, which was in force throughout the Civil War, was only 39,273 men. Small as the regular force has always been, its organization has been altered some two score of times in all.

The law for its organization in force in 1910 provides that the total enlisted strength shall not at any one time exceed 100,000. The full active force of the present organization is as follows: 15 regiments of cavalry, with 765 officers and 13,155 enlisted men; 6 regiments of field artillery, with 236 officers and 5220 enlisted men; 30 regiments of infantry, with 1530 officers and 26,731 enlisted men; 3 battalions of engineers, with 2002 enlisted men, commanded by officers detailed from the corps of engineers; a special regiment of infantry for Porto Rico, with 31 officers and 576 enlisted men; a provisional force of 50 companies of native scouts in the Philippines, with 178 officers and 5731 enlisted men; staff men, service school detachments; the military academy at West Point, Indian scouts, &c., totalling 11,777 enlisted men. The total number of commissioned officers, staff and line, on the active list, is 4209 (including 219 first lieutenants of the medical reserve corps on active duty). The total enlisted strength, staff and line, is 78,782, exclusive of the hospital corps and the provisional force. (See also Navy and Navies.)

X.—History

A.—*Beginnings of Self-government, 1578–1690.*

1. The American nation owes its origin to colonizing activities in which the British, Dutch, Swedes, French and Spaniards bore a share, and which were continued during a period of more than two centuries at the beginning of the modern era. The settlements of the Dutch and Swedes (New Netherland and New Sweden) were soon merged in those of the British, and of the territory colonized by Frenchmen and Spaniards the United States, as it was in 1783, included only certain outlying regions (Florida and certain posts on the Great Lakes and in the Mississippi Valley). All the European nations which were interested in colonization shared in the enterprise, and the population of the region was therefore cosmopolitan from the outset. But the British, especially after 1660, secured a controlling influence, to such an extent that the history of the period can properly be regarded as the record of an experiment in British colonization.

Permanent settlements on the Atlantic seaboard were first made in the early years of the 17th century, and they continued steadily to increase until after 1680. Relatively speaking, that was the period of settlement, but population continued slowly to advance westward. In the 18th century occurred a large immigration of Germans and Scottish-Irish, who settled in Pennsylvania and New York and thence overflowed into the western parts of Virginia and the Carolinas. The only colony which was founded in the 18th century was Georgia (1732), by means of which British outposts on the Florida frontier were strengthened.

General Aspects of Colonization.

2. British colonization originated chiefly in private initiative, though it acted in half-conscious obedience to certain general principles of action. From this fact originated the trend toward self-government, which was fundamental and controlling in the history of the British on the American continent. But to an extent the tendencies which favoured self-government were counteracted by the influence of the British Crown and parliament. The influence of the Crown was continuous, except during the period of the Civil War and Commonwealth (1642–1660), while that of parliament was not felt until the middle of the 17th century, and its colonial legislation subsequent to that time was chiefly confined to matters of trade. The activities of Crown and parliament were directed toward the securing of Imperial interests and of that degree of subordination and conformity which, in states that have developed from Roman and feudal origins, attaches to the condition of colonies or dependencies. The term "imperial control" therefore suggests the second tendency in colonial affairs, to the discussion of which the historian must address himself.

3. Among the colonists the trend toward local independence and self-government was in harmony with the spirit of the English. Neither was it lacking among the other nationalities represented in the colonies. But in the case of the British it was greatly strengthened by the fact that the colonies were founded by private initiative, the government legalizing the efforts of the "adventurers" and planters, but leaving them in many cases almost wholly to themselves. Hence many small colonies and settlements were founded along the coast. A variety of motives—economic, religious and political—contributed to the founding of these colonies, and people correspondingly different in type came to inhabit them. As they differed from one another, so their descendants came to differ from the Europeans, out of the midst of whom they had come. The remoteness of the colonies from Europe and the difficulties under which communication with them was maintained confirmed and perpetuated the tendency toward independence both of England and its government. Somewhat similar conditions controlled intercolonial relations, kept the colonists apart from one another and checked efforts at co-operation. Thus it was that the causes which confirmed the colonists in the spirit of independence toward the mother country at the same time made them jealous of any external authority.

Chartered Colonies.

4. The term "chartered colonies" is the one which best describes the forms under which the British-American settlements were founded and under which they all continued for periods varying from a single generation to that of the entire duration of their colonial existence. They were the direct and characteristic results of private initiative in colonization. The discoverers and would-be

colonizers, acting individually or in groups, collected the ships, men and resources necessary for their enterprises, and procured from the Crown a charter. By this document the king conveyed to them a claim to the soil which would be valid in English law, gave them the right to transfer Englishmen thither as colonists, to trade with them and with the natives, and to govern the colony, subject to the conditions of allegiance and of British sovereignty in general. The rights and liberties of the colonists as British subjects, without attempt to define what they were, were guaranteed by the charters, and the grantee was prohibited from passing laws or issuing orders which were repugnant to those of England. In only a part of the charters—those chiefly which were issued subsequent to 1660—was express reference made to the calling of assemblies in the colonies. So general were the provisions of the charters that they only remotely determined the forms which government should assume under them and what the rights of the colonists should be. A considerable variety of institutions and social types existed under them. But their very indefiniteness made them valuable as objects of appeal to those who in time of controversy were upholding local rights and liberties.

5. Of the chartered colonies there were two varieties—proprietary provinces and corporate colonies. Though alike in the fact that the patentees who founded them were mesne tenants of the Crown, they were quite unlike in their internal organization and to a considerable extent also in the character of the people who inhabited them. The proprietary province was a development from the principle of the fief, though with many variations. The early charters of discovery, those for example which were granted to John and Sebastian Cabot and to Sir Humphrey Gilbert, contemplated the founding of feudal principalities in the New World. The grant to Sir Walter Raleigh, which resulted in the abortive colonial experiment at Roanoke, was of the same character. At the period of transition from the rule of the Tudors to that of the Stuarts, trading companies and companies whose purpose was colonization were increasing in number and importance. The first half of the 17th century was distinguished by the founding of many such, in France and the Netherlands as well as in England. The joint companies which were chartered by James I. in 1606, one to have its residence at London and the other at Plymouth, were of this character. They were granted the right to colonize, the one in northern and the other in southern "Virginia"; the intervening territory, three degrees in breadth, being left common to the two. The rights of the companies were confined to those of settlement and trade. The Plymouth patentees achieved no permanent result; but those of London founded Jamestown (1607) and other settlements along the James river, which later became the province of Virginia (*q.v.*).

Proprietary Provinces.

London and Plymouth Companies.

6. But before this result had been reached the London patentees had secured in succession two new charters, one in 1609 and another in 1612. By means of these grants they had practically separated from the Plymouth Company, had secured a concession of territory 400 m. broad and extending through the continent, and had been able to perfect the organization of their company. By the grant of 1606 the right to govern the colonies had been reserved to councils of royal appointees, one resident in England and one in each distinct colony which should be founded. But by their later charters the London patentees were fully incorporated, and in connection therewith received not only the power to grant land but rights of government as well. This made the Virginia Company of London in the full sense of the word the proprietor of the province which it was founding. It now appointed resident governors, councillors and other officials for the colony, and instructed and controlled them in all ways, subject of course to the general supervision of the king in council. Under the charter of 1606, in order to facilitate colonization on a strange continent, joint management of land and trade was temporarily instituted. But under the fully organized company, as managed by Sir Thomas Smith, and especially by Sir Edwin Sandys and the Ferrars, this system was abandoned, and private property in land and the control of trade through private "magazines" were established. A number of distinct plantations and settlements were founded which later developed into counties and parishes. From these localities, in 1619, under authority from the company, representatives were elected who met with the governor and council at Jamestown and formed the first colonial assembly held on American soil. Its acts were duly submitted to the company in London for its approval or disapproval. Other assemblies were called, the tobacco industry was established and the principles upon which traffic in that staple was to be conducted with Europe were announced. Thus Virginia assumed the form of a proprietary province, with an English trading company as its proprietor.

7. Meantime west of England men had been making fishing voyages and voyages of discovery to northern "Virginia", which now was coming to be known as New England. In 1620 a new charter was procured, the reorganized company being known, in brief, as the New England Council. Like the London patentees, this body was now fully incorporated and received a grant of the vast territory between 40° and 48° N. lat. and extending through to the South Sea (Pacific). Full rights of government, as well as of trade and settlement, were also bestowed. The moving spirit in this revived enterprise was Sir Ferdinando Gorges (*q.v.*), an Anglican and royalist from the west of England. For a time John Mason (*q.v.*) was his most active coadjutor. Such backing as the company received came from nobles and courtiers, and it had the sympathy of the court. But lack of resources and of active interest on the part of most of the patentees, together with the development of a Puritan interest in New England, led to the failure of this enterprise. No colony was established directly by the council itself, but that part of its vast territory which lay adjacent to the coast was parcelled out among the patentees and by them a few weak and struggling settlements were founded. They were all proprietary in character, and those along the northern coast were more or less connected with Anglican and royalist interests. But, as events proved, Plymouth Colony (founded in 1620), which was Puritan and Separatist to the core, became a patentee of the New England Council; and the colony of Massachusetts Bay (founded in 1628–1630), which was to become the citadel of Puritanism in America, procured the original title to its soil from the same source. At the outset both Massachusetts and Plymouth must be classed as proprietary settlements, though far different from such in spirit and destiny. Massachusetts soon (in 1629) secured a royal charter for its territory between the Merrimac and Charles rivers, and thus took a long step towards independence of the council. At the same time the Plymouth settlers were throwing aside the system of joint management of land which, as in the case of Virginia, had been imposed upon them by adventurers who had lent money for the enterprise; were paying their debts to these same adventurers and securing control of the trade of the colony; were establishing a system of self-government similar to that of Massachusetts. Thus a strong Puritan interest grew up in the midst of the domain which had been granted to the New England Council, and in connexion therewith the type of colony to which we have given the name corporate came into existence.

New England Council.

8. In order to understand the nature of the corporate colony, it is necessary to explain the internal organization of that type of company which, like the Virginia Company of London, was founded for purposes of trade and colonization. It was composed of stockholders, who became members as the result of the purchase of shares or of migration to the colony as planters, or of both acts combined. In the Virginia Company they were known as the "generality," in the Massachusetts and other companies as the "freemen." In them, when met as a democratically organized body under the name of "quarter court" or "general court," was vested the governing power of the company. It

elected the officers, chief among whom were a treasurer or governor, and a council or board of assistants. These, as well as the subordinate officers, held for annual terms only. Four times a year, at the law terms, the general courts met for the transaction of business, elections being held at the spring meeting. Membership in such companies might be indefinitely increased through the issue and sale of shares. They were, in other words, open companies, whereas the New England Council was a closed body, its membership being limited to forty. The Massachusetts Company was an open corporation of the type just described.

Massachusetts Company; Removal of Charter to Massachusetts.

9. In 1629 the prospects of Protestantism at large, and of Puritanism in England, were so dark that the founders of the Massachusetts Company, who were decidedly Puritan in spirit and inclined to nonconformity in practice, resolved to remove with their charter and the governing body of their company into New England. Preparatory to this, John Winthrop was elected governor and a settlement was made of their business relations in England. After the removal had been made, the assistants and general court met in New England and business was carried on there exclusively by planters. An order was soon passed that none should vote or hold office who were not members of some one of the churches within the colony. As all these churches were Independent or Congregationalist in form and doctrine, this order gave a wholly new definition to the term "freemen." It made of this colony something approximating to a biblical commonwealth, and subordinated trade, land-holding and settlement to the interests of the Puritan faith. The board of assistants now assumed political and judicial functions. As local settlements about Massachusetts Bay were founded, the general court, which before had been a primary assembly—simply the freemen of the company—came to consist partly of representatives elected by the freemen of the towns. In this way a second chamber—that of the deputies—was added to the assistants to form the general court of the colony. Taxes were levied by this body, and laws and orders proceeded from it which related to all functions of government. It elected or appointed the governor and other chief officials, and determined the times of its own meeting. The governor had no veto and the general court was the controlling organ in the system.

10. Of primary importance in the affairs of the colony was everything which concerned religious belief and church government. The churches and their relation to the civil power presented the great questions upon which hinged its policy. This was true not only in its internal affairs, but in its relations with other colonies and with the mother country. An ecclesiastical system was developed in which Independent and Presbyterian elements were combined. By a rigid system of tests this was upheld against Antinomians, Baptists, Quakers and dissenters of all sorts. The securing of revenue from land and trade was considered subordinate to the maintenance of the purity of the faith. It was this which gave a point and vigour to the spirit of self-government in the New England colonies which is not perceptible elsewhere.

Connecticut; New Haven Colony; Rhode Island.

As a consequence of the Puritan migration from England and of the expulsion of dissenters from Massachusetts, Plymouth, Connecticut (*q.v.*), the New Haven Colony, and the towns about Narragansett Bay which became the colony of Rhode Island (*q.v.*), were settled. These all were corporate colonies, organized upon fundamentally the same plan as Massachusetts but differing from it in minor particulars. Their settlers at the outset had no charters, but by means of plantation or town covenants assumed powers of government, which ultimately were vested in general courts similar to that of Massachusetts. Rhode Island was formed by a union of towns, but elsewhere the colony was coeval with or antedated the town. Connecticut and Rhode Island, the former in 1662 and the latter in 1663, secured royal charters by which they were incorporated within New England itself and the governments which they had established there were legalized. New Haven was absorbed by Connecticut in 1664 under the charter of 1662 (see CONNECTICUT), and Plymouth remained without a charter from the king until, toward the close of the 17th century, it became a part of the enlarged province of Massachusetts.

11. The most prominent feature of the New England land system was the "town grant," which in every case became the territorial basis of a group settlement. Throughout New England, and in the outlying districts which were colonized by New Englanders, settlement was effected by groups. The process began in Plymouth and was extended through the entire section. The Puritan migration from Europe was of the same general character. Groups of people, animated by a common religious or political ideal, broke away from their original or temporary abiding-places and pushed farther into the wilderness, where tracts of land were granted to them by the general court. The corporate colonies did not seek profit from their land, but granted it freely to actual settlers, and in such amounts as suited their needs. No distinct land office was established by any New England colony. Land was not sold by the colony; nor, as a general rule, was it leased or granted to individuals. Rent formed no appreciable part of the colony revenue.

12. Over the founding of towns the general courts, as a rule, exercised a watchful supervision. Not only did the courts fix and maintain their bounds, but they issued regulations for the granting of lands, for common fields, fences, herds, the punishment of trespass, the admission of inhabitants and freeholders, the requirement that records of land titles should be kept, and the like. But subject to these general regulations, the allotment and management of its land was left to each town. The colonies had no land system apart from the town. It was partly in order to manage their lands that the towns were made centres of local government and town meetings or boards of town proprietors were established. By means of town action, taken in town meetings and by local officials, the land of each settlement was laid off as house lots, common and common fields, meadow and pasture. Detailed regulations were made for the management of common fields and for their ultimate division and allotment among their proprietors. The same was true of fences and herds. The result was an organization similar to the English manor, but with the lord of the manor left out; for in the case of the New England town administrative authority resided in the body of the freeholders. To this peculiarity in the form of New England settlement is due the prominence of the town, as compared with the county, in its system of local government. The town was the unit for purposes of taxation and militia service as well as of elections. It was also an important ecclesiastical centre, the parish usually corresponding with it in extent.

13. As a result of the process thus sketched, southern New England was settled by a population of English origin, with similar instincts and a form of political organization which was common to them all. Gorges, meantime, had secured (1639) a royal charter for his province of Maine, but Mason had died before he obtained such a guaranty for his settlements on the Piscataqua river. The small communities along that entire coast remained weak and divided. In 1635 the New England Council surrendered its charter. The helplessness of the Gorges family was insured by its adherence to the royalist cause in the English Civil War. Massachusetts availed itself of a forced interpretation of the language of its charter respecting its northern boundary to extend its control over all the settlements as far north-east as the Kennebec river. This was accomplished soon after 1650, and for the time Anglican and royalist interests throughout New England seemed hopelessly wrecked. New England had thus developed into a clearly defined section under Puritan domination. This fact was also clearly indicated by the organization, in 1643, of the New England Confederacy, or the United Colonies of New England (see NEW ENGLAND), which comprised the orthodox Puritan colonies, whose leading magistrates, as annually elected commissioners, for twenty years exercised an advisory control over New England.

14. The colonies of the middle and southern sections of the territory, which later became the United States, were wholly proprietary in form. This was true of New Netherland (founded by the Dutch West India Company in 1621) and of New Sweden (settled under the authority of the Swedish Royal Company in 1638), as well as of the English colonies which were established on that coast. In the case of Virginia and of the Dutch and Swedish settlements, trading companies were the proprietors. But the later English colonies, beginning with Maryland in 1632, and continuing with the Carolinas (1663), New York (1664), New Jersey (1665), Pennsylvania and the Lower Counties, afterwards Delaware (1681), were founded by individual proprietors or proprietary boards. Georgia (1732), the only English colony settled after 1681 on the continent, existed for twenty years under a proprietary board of trustees. By the efforts of adventurers of this class, put forth chiefly during the period of the Restoration, the entire coast-line from Florida to Acadia was permanently occupied by the English. But, unlike New England, the population of the other sections was of a mixed character, as were their economic and religious systems, and to an extent also their political institutions.

Middle and Southern Colonies.

15. As has already been stated, in their internal structure and in the course of their history the proprietary provinces differed very materially from the corporate colonies. Those of later English origin also differed in some important respects from Virginia under the company and from New Netherland and New Sweden. The system of joint management of land and trade, which was so characteristic of early Virginia, was outgrown before the other proprietary provinces were founded. Neither did it prevail in the Dutch and Swedish provinces, but there the law and institutions of government of those nations existed, and no provision whatever was made for assemblies.

16. In the proprietary province the proprietor, or board of proprietors, was the grantee of powers, while in the corporate colony it was the body of the freemen organized as an assembly or general court. The proprietor might or might not be a resident of the province. He might exercise his powers in person, or, as was usually the case, delegate them to one or more appointees. In any case, the form of government of the proprietary province was essentially monarchical in character. The powers that were bestowed were fundamentally the same as those which were enjoyed during the middle ages by the counts palatine of Chester and Durham. In some charters express reference was made to Durham as a model. The normally developed provinces which resulted were miniature kingdoms, and their proprietors petty kings. As Coke said, their powers were king-like though not sovereign. This character arose from the fact that the grantee of power was the executive of the province. This branch of government was thereby brought into the forefront. At the beginning and for a long time thereafter it continued to bear the leading part in affairs. It was not so in the corporate colony, for there the freemen and the general court stood at the centre of the system, and their ultimate control, which no one dreamed of disputing, was maintained through a system of annual elections. In most of the corporate colonies the executive (*i. e.* the body of magistrates) was strong, but that was due to the political and social influence which its officials had gained, and not to their tenure of office. But the nature of the proprietary province demands further explanation.

17. In every case, apart from the ordinary rights of trade and the guarantees of the liberties of the colonists, the powers which were bestowed on the proprietors were territorial and governmental. The territory of the provinces was granted under the conditions which by English law controlled private estates of land. An entire province, or any part of it, could be leased, sold or otherwise disposed of like a private estate. It was an estate of inheritance, descending to heirs. The attitude of proprietors toward it was that of landlords, investors or speculators in land. They advertised for settlers, and, in doing so, an ever present motive with them was the desire to secure more private income from land. In 1664 the duke of York sold New Jersey to Berkeley and Carteret, and the sale was effected by deeds of lease and release. In 1708 William Penn mortgaged Pennsylvania, and under his will devising the province legal complications arose which necessitated a suit in chancery. Thus proprietors and proprietary boards changed with every generation or oftener. All this, of course, was different in the corporate colony.

Government of the Proprietary Province.

18. In all the later proprietary charters, except that of New York, the operation of the statute *Quia emptores* was suspended, so far as relations between the proprietor and his immediate grantees were concerned. By virtue of this provision each proprietor, or board, became the centre from which originated an indefinite number of grants. These were held directly of the proprietor and through him of the Crown. In practice the same was true also of New York. The proprietors were thus left free to make grants on such conditions as they chose—limited by the nature of their patents—to erect or permit the erection of manors, to devise the machinery necessary for surveying, issuing and recording grants, and collecting rents. Preparatory to the exercise of this power, the proprietors issued so-called "concessions" or "conditions of plantation," stating the terms on which they would grant lands to colonists. These were often accompanied by descriptions of the country, which were intended to be advertisements for settlers. Under a system of head rights, analogous to that which existed in Virginia, land was thus bestowed on settlers upon easy terms. Proportional amounts of land were granted upon the importation of servants, and in this way a traffic in servants and their head rights to land was encouraged among planters and masters of merchant vessels. In all the provinces, except New Netherland, a quit rent was imposed on all grants. In the Dutch province rents were sometimes imposed, but they varied in character and differed from the English quit rent. In Maryland fines were levied on alienations. In Maryland and Pennsylvania the demand for land became so great that it was sold. In most of the provinces manorial grants were made, but in none except New Netherland did the manor become an institution of government. In all the provinces territorial affairs were administered directly by the provincial authorities, and not by towns as in New England. In Maryland a land office was fully organized, towns developed only to a very limited extent, and when they did originate they were in no sense village communities. Lots in them were granted by provincial authorities and they were subject to a quit rent. They were simply more densely populated parts of the counties, and, unless incorporated as boroughs, had no distinct institutional life. In almost all cases land, in the provinces, was granted to individuals, and individual ownership, with direct relations between the owners or tenants and the proprietary authorities, was the rule. This was in marked contrast to the conditions which have been described as existing in the corporate colonies. In the corporate colony the elements of the fief had been eliminated, but in the provinces they still survived to a considerable degree.

19. Had governmental powers not accompanied the territorial grants which have been described, these grants would have been estates of land, unusually large, no doubt, but nothing more. In cases where the governmental rights of proprietors were suspended or resigned into the hands of the Crown, they remained thereafter only private landlords. But the fact that rights of government were bestowed with the land made the territory a province and the proprietor its political head. The bestowment of rights of land carried with it not only the obligation to pay quit rent, but to take to the proprietor the oath of fidelity.

20. In the discussion of the corporate colony it was necessary to dwell first and chiefly on the legislature. But in the case of the proprietary province the executive, for the reason already mentioned, demands first attention. The provincial charters made the proprietors the executives of their provinces and for the most part left it to them to determine how and under what forms the governmental powers which they had received should

be exercised. The powers which were definitely bestowed were executive and judicial in character—the ordinance power, the authority to appoint all officers, to establish courts, to punish and pardon, to organize a military force and defend the provinces, to bestow titles of honour, to found churches and present to livings. The executive thus became the centre from and around which development in the province chiefly occurred. It gave to the proprietor an importance, especially at the outset, which was comparable with that enjoyed by the general courts in the corporate colonies. It made him in a derived and inferior sense the source, within the province, of office and honour, the fountain of justice, the commander of the militia, the recipient of the provincial revenue, the constituent part of the legislature. But in most cases the proprietors did not attempt to exercise these powers in person. Even if resident in their provinces they needed the assistance of officials. By means of commissioners they appointed a group of leading officials for their provinces, as a governor, councillors, a secretary, surveyor-general, receiver-general or treasurer, and somewhat later an attorney-general. These all held office at the pleasure of the proprietor, and were subject to guidance by his instructions.

The Provincial Governor.

Altogether the chief place among these officials was held by the governor. He was *par excellence* the agent for the proprietor for all purposes of administration. He regularly corresponded with the proprietor and received the latter's directions. In making appointments the proprietor was usually guided by his recommendations. In some cases he was a relative of the proprietor, and family influence, in Maryland after the Restoration came to dominate the government of the province. In all his important acts the governor was required to take the advice of his council, and that body was expected to co-operate closely with him in all matters; but the governor was not bound to follow their advice. The relations between the two was the same as that between the king and his privy council in England. As settlements multiplied and counties and other local subdivisions were formed, other and inferior offices were created, the right of appointment to which rested with the governor, though it was exercised in the name of the proprietor. By means of an executive, thus organized, land was granted and the revenue from it collected, counties and other local divisions were established, relations were developed with the Indians, early preparations were made for defence, courts were opened and the administration of justice begun.

21. But in the later proprietary charters generally, with the exception of that issued to the duke of York, provision was made for assemblies. It was made, however, in very general terms, and it was left to the option of the proprietors to determine when, where and how they would call them. These legislatures did not originate in the natural or pre-existent rights of Englishmen, nor did the existence of a parliament in England make them necessary, though it greatly increased the difficulties of governing the colonies without them. Though they were not original in the sense which attached to the executive, they were immediately proven to be indispensable and their activity in the provinces gradually opened the way for the growth of modern democratic institutions.

The Provincial Legislature.

22. When met in regular form, the provincial legislature consisted of the governor, the council or upper house, and the assembly or deputies. The latter, who were elected by the localities, constituted the only representative part of the legislature. In tenure and functions the governor and council were largely independent both of the deputies and of the electors. They were a part of the executive and were naturally swayed by a regard for the interests of the proprietor and by administrative traditions. Though a component of the legislature, the council was the legal advisor of the governor. In many cases the importance of the councils was increased by the fact that, with the governor, in early times they formed the highest judicial tribunal in the province. As the governor had the sole power of calling, proroguing and dissolving the general assembly, the council might advise him in such a way as to destroy the body itself or thwart its plans. The joint work of the council and assembly was subject to the veto of the proprietor, or of both the proprietor and his governor. The legislature of the province, therefore, differed materially from the general court, though in practice this was somewhat offset by the fact that in the New England colonies the magistrates were usually re-elected for a long series of terms.

23. In the province, as in the kingdom, the legislature was in a sense an expansion of the executive, developed out of it, and was to an extent controlled by it. Out of this relation arose the possibility of conflict between the two parts of the legislature—that which represented the people and that which represented the proprietor. In the history of the provinces this formed the central line of cleavage. From the first the assemblies largely controlled taxation. Using this as a lever, they endeavoured to limit and define the powers of the executive and to extend the sphere of legislation more widely. Fees, from which officials derived most of their support, were a favourite object of their regulation. Occasionally offices which had originally been appointive were made elective. Protests of various kinds were made against official cliques. British statutes which favoured liberty and the powers of parliament were often referred to as guides and ideals of the opposition. Now and again the lower house came to a deadlock with council or governor. Threatened or actual revolt was sometimes necessary to bring the executive to terms. By such tactics as these the popular elements in the constitutions of the provinces asserted themselves. The sphere of ordinance was gradually limited and that of statute extended, while incidentally the system of government became more complex.

Constitutions.

In a number of provinces—the Carolinas, New Jersey and Pennsylvania—the proprietors at various times initiated elaborate constitutions, in which not only a land system, but forms and functions of government were prescribed on a large scale. These were variously known as fundamental constitutions, concessions and agreements, frames of government, and in every case were submitted to the general assembly for its acceptance or rejection. Long struggles often ensued over the question of acceptance, which usually ended in the modification or rejection of the schemes as too cumbersome for use or because they reserved excessive powers to the provincial executive.

Course of Development.

24. Though the main features in the form and development of the proprietary provinces have thus been indicated, it should be noted that their history was by no means uniform. In New Netherland and New York occurred a struggle for the establishment of a legislature, which continued at intervals for forty years and was not permanently successful until after New York had become a royal province. The proprietors of New Jersey never secured a royal charter, and therefore were not able to establish satisfactorily their claim to rights of government. As grants of land had been made to the settlers in certain localities within that province before its purchase by Berkeley and Carteret, opposition was made to the collection of quit rents, as well as to the enforcement of rights of government, and disturbances, resulting from these causes, became chronic. The province was also divided into East and West Jersey, the boards of proprietors being greatly increased in both, and West Jersey attaining an organization which was almost democratic in character. Within the vast reaches of the Carolina grant developed two provinces. One of these—North Carolina—was almost entirely neglected by the proprietors, and the weakened executive repeatedly succumbed to popular violence. In South Carolina many violent controversies occurred, especially over the efforts of the proprietors to compel the acceptance of the Fundamental Constitutions, which originated with Locke and Shaftesbury. But in the end this failed, and a simple form of government, such as was adapted to the needs of the province, was developed. In Pennsylvania the liberal policy of the proprietor led at the beginning to unusual concessions

in favour of the colonists. One of the most characteristic of these was the grant of an elective Council, which was intended to be aristocratic and the chief institution in the province. But owing to conflicts between it and the governors, affairs came to a deadlock. The total neglect of provision for defence by the Quaker province led to the suspension of Penn's powers of government for about two years after the English Revolution and the outbreak of the war with France. This did away with the elective Council for the time, and an appointive Council was soon substituted. Finally, in 1701, the Council was deprived of its powers of legislation and thereafter the legislature of Pennsylvania consisted of only one house—the Assembly.

B.—*Development of Imperial Control, 1606–1760.*

25. Turning now to the exercise of imperial control over the colonies, it is to be noted that it proceeded chiefly from the English Crown. It was exercised through the secretary of state, the privy council and a succession of boards subordinate to it which were known as commissioners of plantations or the board of trade; by the treasury and admiralty boards and their subordinate bureaus; by the attorney-general and the solicitor-general and by the bishop of London. The more continuous and intimate supervision proceeded from the privy council and the commissioners subordinate to it, and from the treasury board. The latter caused the auditing of such revenue as came from the colonies, supervised expenditures for them and had an oversight over appointments in the colonial service. The privy council received letters and petitions on almost every kind of colonial business, caused hearings and inquiries to be held, and issued letters, instructions and orders in council on an equally great variety of matters. It also acted as the regular court of appeal for the plantations. As time advanced, more of the administrative business passed directly into the office of one of the secretaries of state and the privy council became less active. The admiralty was concerned with the equipment of the navy for service in the colonies, and the high court of admiralty with the trial of prize cases and of cases arising from violations of the acts of trade. The assistance of the law officers of the Crown was sought in the drafting of charters, in the prosecution of suits for their recall, and in all cases which required the interpretation of the law as affecting the colonies and the defence of the interests of the British government in relation thereto. The bishop of London had supervision over the appointment and conduct of clergymen of the English Church in the colonies and over parish schools there. Not all of these boards and officials were active from the first, but they were created or brought into service in colonial affairs as the importance of the dominions increased.

The Crown.

26. The parliament by mentioning the dominions in its statutes could extend their provisions to the colonies. The early acts of supremacy and uniformity contained such reference, but it was dropped after the Restoration and no serious attempt was ever made to enforce uniformity in the colonies. Parliament did not begin to legislate seriously for the colonies until after the Restoration. Then the acts of trade and navigation were passed, to which additions were made in the reign of William III. and from time to time during the 18th century. This body of legislation, including about fifty statutes, comprised the most important acts relating to the colonies which were passed by parliament. A few statutes relating to military affairs were passed about the middle of the 18th century. Certain other laws relating to currency and coinage, to naturalization, to the punishment of governors, to the post office, to the collection of debts, and to a few other miscellaneous subjects complete the colonial legislation of parliament prior to 1760. About one hundred statutes in all were passed. The colonists themselves imitated in a general way the organization and procedure of the English courts. The main features of the common law came spontaneously into force in the colonies. The legislatures of several of the colonies adopted large parts of the statute law of England. The colonists were always accustomed to avail themselves, as far as possible, of the great English statutes which guaranteed liberty. After about 1690 the obligation was very generally enforced upon the colonies of sending the acts of their assemblies to England for acceptance or rejection by the king in council. Thus a general agreement between colonial and English law was attained.

Parliamentary Control.

27. But this, though far-reaching, was only one of the objects which were sought through the exercise of imperial control. Its object was to maintain the rights of Great Britain over the colonies and her interests in them in all respects. The diplomacy of Great Britain concerned itself to an increasing extent, as the 18th century advanced, with the acquisition or losses of colonial territory, with the fixing of boundaries and with the securing of commercial interests. The interests of trade, more than any other subject, determined the colonial policy of England. The Church and her interests also demanded attention. In all these matters the English executive—the Crown—continuously, and for the most part exclusively, managed colonial affairs. During the Commonwealth in the 17th century parliament was the source of all activity, whether legislative or executive, but at other times, as we have seen, its legislation was confined chiefly to the subject of trade. The English courts also played a minor part except when, in conjunction with the executive, they were concerned in the revocation of colonial charters.

28. A natural condition which affected colonial administration as a whole and to a large extent determined its limits and character was the remoteness of the colonies from England. With this the conditions of sparse and scattered settlements in a new continent in the midst of savages were closely connected. At best three months were required for sending a despatch from London to America and procuring a return. This explains the large degree of self-government which the colonies possessed and the indifference with which their affairs were usually viewed, even by British officials. Only a relatively small part of colonial business came before English officials or received their serious attention. Only at long intervals and in summary fashion was it brought to the attention of parliament. It is believed that the affairs of the continental colonies were never seriously debated in parliament until after the beginning of the controversy which led to the American War of Independence. Social and political intercourse with the colonists and governmental control over them were therefore very imperfectly developed, as compared with that which existed within the realm. That is the real meaning of the distinction between the realm and the dominions. Over the counties and other local jurisdictions of the realm the control of Crown and central courts and parliament was continuously felt. In law and theory the same was true of the dominions; in fact, the control over them was almost wholly executive, and during most of the period it was to a degree unintelligent and weak. In theory the British Empire was a consolidated structure; in fact it was something more resembling a federation.

Isolation of the Colonies.

29. The central fact in colonial history during the 17th century was the development of the chartered colonies. At their founding, as we have seen, the Crown delegated rights of settlement and subordinate rights of government to proprietors, who used them in a variety of ways. The effect of this was to introduce a number of mesne lords between the king and his colonial subjects, a phenomenon which centuries before had vanished from England itself. The patentees governed the colonists, and the Crown only interfered at intervals to adjust matters. And when the Crown did this, its dealings were far more with the patentees and their officials than with the body of the colonists. The king had no officials of his own in the colonies, and a practical system of immunity existed. Under the first two Stuarts some rather desultory efforts were made to check the development of such a system in the early stages. After a controversy over a contract for

Development of the Chartered Colony.

the sole importation of tobacco, which became involved with the political struggles of the time in England, the charter of the Virginia Company of London was revoked (1624). A royal commission was appointed to readjust the affairs of Virginia and to inaugurate its government as a royal province, and the king declared that he desired the government of all his dominions to be monarchical in form. Several commissions were later appointed to manage the tobacco trade. In 1634 a board of commissioners of plantations was created and it received very large powers over the colonies. Of this body Archbishop Laud was the moving spirit. The year following the New England Council resigned its charter, a writ of *quo warranto* was issued against the Massachusetts charter, and a plan was nearly perfected for sending out Sir Ferdinando Gorges as royal governor, or rather governor-general, to New England. But means were lacking, the suit against the Massachusetts patent failed to accomplish its purpose, and troubles at home soon absorbed the attention of the government.

30. During the Great Rebellion in England New England was left practically to itself. Strife broke out in Maryland, over which the home government was scarcely able to exercise even a moderating influence. The Dutch from New Netherland and Europe were able to monopolize a large part of the carrying trade in tobacco and European goods. Virginia, with Barbadoes and a few other island colonies, assumed an attitude of distrust or hostility toward the new government in England. In 1651 and 1652 parliament sent out a commission, with an armed force, which reduced the island colonies to submission and adjusted affairs in Virginia by suspending government under Sir William Berkeley, the royalist governor, and leaving control in the hands of the Assembly. By a stretch of power the commissioners also took control of affairs in Maryland, but there they intensified rather than allayed the strife. Baltimore, however, managed to save his interests from total wreck, and at the Restoration was able fully to re-establish his authority.

Commercial Influences; Administrative Changes; Navigation Acts and other Restrictive Legislation.

31. During this period of unstable government in England the seeds were planted of a colonial policy which was henceforth to dominate imperial relations. It was then that England entered upon the period of commercial rivalries and wars. The Cromwellian government determined to wrest the control of the carrying trade from the Dutch, and the Navigation Act of 1651 and the first Dutch War were the result. General Robert Sedgwick was sent against New Netherland, but ended in attacking Acadia. At this time also the national hatred of Spain, which had so characterized the age of Elizabeth, reasserted itself and the Spanish seas were invaded, Hispaniola was attacked, and Jamaica was conquered. In connexion with these events plans were formed for a more systematic colonial administration, which Cromwell did not live to execute, but which were taken up by Clarendon, the duke of York, the earl of Shaftesbury and a large group of officials, lawyers and merchants who surrounded them. They took definite shape after the Restoration in the creation of a council for trade and a council for foreign plantations, in the passage of the acts of trade, in the conquest of New Netherland and the organization within it of three English provinces, in the settlement of the Carolinas, in a resolute attempt to remedy grievances and adjust disputes in New England. These events and their consequences give greater importance to the next three or four decades than to any later period until the colonial revolt.

32. The council for foreign plantations was continued, sometimes under a patent and sometimes as a committee of the privy council, until, in 1696, it was commissioned as the board of trade. As a board of inquiry and report, subordinate to the privy council, the most important business relating to the colonies was transacted before it. The acts of trade, in which the principles of the system were laid down, were passed in 1660, 1663, 1673 and 1696. They expanded and systematized the principles of mercantilism as they had long been accepted, and as in some particulars they had already been applied to the Virginia tobacco trade. The import and export trade of the colonies was required to be carried on in English and colonial built ships, manned and commanded by Englishmen. The policy of the staple was applied to the trade of the colonies by the enumeration of their chief products which could not be raised in England and the requirement that such of these as were exported should be brought to England and pay duties there, and that thence the supplies not needed for the English market should be sent to foreign countries. The same policy was applied to all colonial imports by the requirement that they should pass through English ports. In order to prevent intercolonial traffic in enumerated commodities, which might lead to smuggling, the act of 1673 provided for the levy of an export duty on them in the colonies in cases where a bond was not given to land them in the realm. In the 18th century severe restrictive measures were passed to prevent the growth of manufactures, especially of wool, hats and iron, in the colonies; but these acts proved mostly a dead letter, because the colonies had not reached the stage where such industries could be developed on any scale. Certain compensations, favourable to the colonies, also appear in the system, *e.g.* the measures to suppress the raising of tobacco in England and Ireland, in order that the colonists might have the monopoly of that market; the payment of bounties on the importation of naval stores and on the production of indigo by the colonists; the allowance, on the re-exportation of colonial products, of drawbacks of part or all of the duties paid on importation; the admission of colonial imports at lower rates of duty than were charged on the same products from foreign countries. In order to ensure the enforcement of these acts elaborate provisions became necessary for the issue of bonds, and this, with the collection of a duty in the colonies, led to the appointment of colonial customs officers who were immediately responsible to the commissioners of the customs and the treasury board in England. With them the governors were ordered to co-operate. Courts of vice-admiralty, with authority to try cases without a jury, were established in the colonies; and just before the close of the seventeenth century they were given jurisdiction over violations of the acts of trade, a power which they did not have in England. Naval officers were very generally provided for by colonial law, who were to co-operate with the customs officers in the entry and clearance of vessels; but in some cases their aim was rather to keep control over trade in colonial hands. It thus appears that the resolve to enforce the policy set forth in the acts of trade resulted in a noteworthy extension of imperial control over the colonies. How far it was successful in the immediate objects sought it is impossible to say. In some of the colonies and at some times the acts were practically nullified. Illegal trading was always carried on, especially in time of war. In such times it was closely allied with privateering and piracy. But in the large it is probable that the acts were effective, and their existence always furnished a standard to which officials were required by their instructions and oaths to conform. By the Act of Union of 1707 Scotland was admitted to the advantages of the English trade system. In 1733, in order to check the development of the French colonies and prevent the importation of their products into English possessions, the Molasses Act was passed. This provided for high specific duties on rum, molasses and sugar, when imported from foreign colonies into those of Great Britain. So high were these rates that they could not be collected, and therefore no serious attempt was made to enforce the act.

Molasses Act.

33. Returning again to the 17th century, in order to trace in other connexions the notable advance which was then made in colonial administration, we are to note that the conquest of New Netherland by the British in 1664 was an event of great importance. Taken in connexion with the settlement of the Carolinas, it completed the hold which the English had upon the North American coast and gave them for the first time an extent of territory which could be profitably developed.

The occupation of New Netherland was effected by a royal commission, which was also empowered to hear complaints and report a plan for the settlement of disputes in New England. Precedents for such a commission existed in the past, and a little more than ten years later a similar body, accompanied by a military force, was sent to Virginia to adjust matters at the close of Bacon's rebellion. But the commission of 1664 was the most noteworthy example of its kind. Yet, though it succeeded at New Amsterdam and in the southern colonies of New England, it failed at Boston. Massachusetts would not admit its right to hear appeals. It did not succeed in wresting from Massachusetts the territory of New Hampshire and Maine, which the heirs of Gorges and Mason claimed.

34. In 1676 Edward Randolph was sent as a special agent to Massachusetts, to require it to send agents to England. He returned to England the sworn enemy of that colony and continued to be its tireless prosecutor. A series of negotiations ensued which lasted for almost a decade, and ended in the revocation of the Massachusetts charter by a degree in chancery, 1684. New Hampshire had already been organized as a royal province. Government under the charters of Rhode Island and Connecticut was soon after suspended. All New England was then organized as a dominion or vice-royalty under Sir Edmund Andros. Assemblies were everywhere abolished and government was left wholly in the hands of the executive. New York—also without an assembly—and New Jersey were soon after incorporated with the Dominion of New England, its boundary being extended to the Delaware river (see NEW ENGLAND). After Bacon's rebellion in 1676 the lines of executive control were strengthened in Virginia, but the Assembly continued active. These rapid changes involved the downfall of the former system of chartered colonies and the substitution of royal provinces in their place. The effect of this was to introduce into the colonies a large number of officials of royal appointment—the governors, members of the council, judges, secretaries, surveyors-general, receivers-general and attorneys-general. The entire executive and judiciary in a royal province was appointed directly or indirectly by the king. Its members held under commissions subject to the king's pleasure and were controlled by his instructions. The exclusiveness of the chartered jurisdictions no longer obtained, but the Crown through its officials was brought into direct relations with the body of the colonists. Government could now be carried on under relations analogous to those between Crown and people in England.

Dominion of New England.

35. By the abolition of assemblies and the union of colonies on a large scale James II. did violence to the strongest feelings and traditions of the colonists. The New Englanders not only viewed the levy of taxes by prerogative with the utmost aversion, but they feared a general unsettlement of land titles, the destruction of much that was valuable in their system of town government, and the introduction of Anglican worship among them. They shared also in the fear, which was widespread among the colonists, that the Crown intended by an alliance with the French and Indians to force Roman Catholicism upon them. Therefore the fall of the Stuart government in England was the signal for an uprising at Boston (April 1689) followed by a less successful one at New York. The Dominion of New England at once collapsed and the old colony governments were generally restored. A revolt against the Catholic proprietor in Maryland resulted in the suspension of his powers of government and the organization of Maryland as a royal province. William III. granted a new charter to Massachusetts (1691) in which full provision was made for an assembly, but also for a governor and secretary of royal appointment. Rhode Island and Connecticut were allowed to remain under their corporate charters. New York and New Hampshire were organized as royal provinces with assemblies. Proprietary government struggled back into existence in New Jersey. In Pennsylvania the governmental powers of the proprietor were suspended for two years (1692–1694), because of his neglect of provision for defence; then they were restored and Pennsylvania continued under proprietary government until the War of Independence.

Colonial Reorganization.

36. The transition from the system of chartered colonies to that of royal provinces was thus begun and well advanced towards completion. But it was a gradual process, and the later stages of it were not reached until the second decade of the 18th century. South Carolina became provisionally a royal province in 1719, and a parallel change was completed in North Carolina a decade later. Georgia received a royal government in 1752. But in 1715 Maryland was permitted to resume its proprietary form. After the Revolution of 1689 the change to royal governments did not involve in any case the abolition of colonial assemblies. Henceforward the Crown had a fully equipped executive in every royal province, and for the maintenance of its rights could depend upon its efforts and the influence which it was able to exert upon the assemblies. The governors exercised the royal rights of calling, proroguing and dissolving the assemblies; they assisted in initiating legislation and exercised the right of veto. All bills passed by the assemblies were required to be submitted to the king in council, for acceptance or disallowance. The upper houses of the legislature were the councils of the provinces. These were small bodies and consisted, in every case except Massachusetts, of royal appointees. Their support was in most cases given to the governors, and by that means they were greatly assisted in resisting the encroachments of the lower houses of assembly, which were elected by the freeholders. But, as a rule, the Crown made no provision for the salaries of its governors and other officials, and left them largely dependent for support on appropriations by the assemblies. In very many cases the withholding of salaries was successfully resorted to by the assemblies as a means of thwarting the executive or forcing it into submission. Under this system of balanced forces, analogous in general to that which was reached after the Revolution in England, the colonies entered upon the long period of the French wars.

C.—*The Struggle with the French, 1690–1760.*

37. Early French discoveries and colonization in North America were confined chiefly to the valley and gulf of the St Lawrence. These led, in the early 17th century, to the establishment of the province of Canada. By 1610 the French had possessed themselves of the valley of the lower St Lawrence, and the relations with the Indian tribes were being determined. During the next fifty years Canada grew slowly into an autocratically governed province, in which a mild form of feudalism existed and in which the Catholic Church was so strong as to contest supremacy at times with the civil power. The fur trade became from the first a most important industry in the province. The Jesuits and other priestly orders undertook missionary work on a large scale among the natives. The fur trader and the missionary soon extended French influence through the region of the Great Lakes and involved the province in intimate relations with the Indian tribes, and that throughout a large area of country. Between the Iroquois and the French wars were almost continuous, but with the other Indian tribes the French were in general on friendly terms. The Iroquois, on the other hand, maintained friendly relations with the Dutch and afterwards with the English. This deeply affected relations between the English and the French, as well as the entire development of the province of New York.

38. Exploration was a most important incident of both the fur trade and the missionary enterprises of the French. Between 1670 and 1690 their work culminated in the great exploring activity of Marquette, Joliet and La Salle. The Ohio and Mississippi rivers were discovered and their courses were mainly or wholly traced. Explorers also penetrated far into the regions beyond the Mississippi. Posts were established at various points along the Great Lakes. During the first two decades of the 18th century the French also established themselves on the Gulf of Mexico, Mobile being founded in 1702 and New Orleans in 1718.

French Expansion.

Quebec and the Gulf ports were then connected by a series of forts which, though few and weak, sufficed for communication and for the establishment of a claim to the Mississippi Valley. They were Niagara and Detroit, commanding the approaches to lakes Erie and Huron; Fort Miami, on the Maumee river; Fort St Joseph, at the southern end of Lake Michigan; Vincennes and French Fort, on the Wabash; Fort Chartres, on the Mississippi opposite St Louis; Michillimackinac and Ste Marie, which guarded the upper lakes. French zeal and enterprise had thus seized upon the heart of the continent, and was prepared to oppose any westward movement which the English might in the future attempt. It seemed possible that English settlements might be confined to the coast, for they expanded slowly and no genius for exploration or sympathy with Indian life was shown. The tendency of British commercial policy was likewise to confine them there; for in no other way did it seem possible to restrict the trade of the colonists to British markets. The Indian alliances of the English were also far less extensive than those of the French. The provinces of South Carolina and Georgia had conflicts with the Spanish on the Florida frontier, and in these the Indian tribes of the south were also involved. But these rivalries were slight and local in character, when compared with the struggle for supremacy which was preparing between the French and English.

39. The conflict with the French was precipitated by events in Europe. It was the English Revolution of 1689 that opened the great conflict between France and England. The question of Protestantism versus Catholicism was involved, but at bottom the struggle was one for the balance of power among European states. Rival claims between the two powers in America, Africa and Asia existed at the beginning of the conflict, or originated and were intensified as it progressed. Questions of commercial and naval supremacy world-wide in extent were involved, and the colonial possessions of the two states were necessarily drawn into the struggle. In America it involved four intercolonial wars, which were closed respectively by the treaties of Ryswick (1697), Utrecht (1713), Aix-la-Chapelle (1748), and Paris (1763). Between the second and third wars intervened thirty years of peace, the early period of Hanoverian and Whig ascendancy in England, the so-called Walpole era. On the American continent during the first two wars the struggle was confined to the northern frontier, and consisted of devastating raids by the French and Indians, which in turn provoked retaliatory efforts on the part of the English. These took the form in part of attacks on Acadia and of unsuccessful efforts to conquer Canada by means of joint expeditions by sea and land. The favourite land route was that from New York by way of Lake Champlain to Montreal, while the expeditions by sea were forced to make the long and perilous voyage round Nova Scotia and through the Gulf and River St Lawrence to Quebec. In 1690, and again in 1711, an enterprise of this kind was actually undertaken. Acadia, "with its ancient limits," and the claim of France to Newfoundland and the Hudson Bay territory were, however, ceded to England by the treaty of Utrecht.

Wars between British and French in America.

40. As the great world-conflict progressed the relative importance of the colonial and maritime issues which were involved increased. The first two wars had their origin primarily in European questions. The third war had its beginning in the Spanish West Indies, and clearly revealed the existence of the Bourbon Family Compact, which bound France and Spain together in active alliance. On the American continent its most striking event was the capture, in 1745, of Louisburg, a stronghold which the French had recently fortified on Cape Breton for the purpose of defending its interests in the Gulf of St Lawrence. This victory was secured largely by the efforts of the New England colonists. In the following year another plan for the conquest of Canada was thwarted by the necessities of war in Europe. At the close of the war Louisburg, too, was restored to the French. After this fashion did the world-struggle react upon the special interests of the English in North America, and perplex and irritate the colonists. In the fourth intercolonial war (1754–63) the struggle between the two nationalities in North America was decided. Events which immediately preceded this war—the occupation of the Ohio Valley and the building of Fort Duquesne—clearly revealed an intention on the part of the French to exclude the English from the Mississippi Valley and confine them to the Atlantic slope. A persistent effort was also made to recover Acadia. The western, as well as the northern, frontier was not threatened, and the war which followed affected all the colonies. Great Britain sent over a succession of commanders-in-chief. Great improvement was made upon the crude efforts at joint colonial action which had characterized the earlier wars. To as great a degree did the Albany Congress of 1754 (see ALBANY, NEW YORK) surpass in importance the meetings of governors and military officers which had occasionally been held in previous times, though its plan of colonial union failed to meet the approval both of the colonists and of the government of Great Britain. The campaigns of this war were all upon a comparatively large scale. Campaigns were carried on not merely along the line of Lake Champlain and in Acadia, but against Fort Duquesne (see PITTSBURG, PENN.), Oswego, and Fort Frontenac, Louisburg, and Quebec (*q.v.*) itself. The weak Spanish power was overthrown in Florida and expeditions were sent against the southern Indians. In all quarters, and especially after Pitt became secretary of state, the British assumed the offensive. The navy of Great Britain, as well as its army, was called into action on a much larger scale in America than ever before. The result was the conquest by the British of Canada, and with it of all North America east of the Mississippi river; the French claim to territory west of this river was ceded to Spain in 1762.

41. The wars with the French brought the problem of colonial defence among the English into greater prominence than ever before, and added it to the other questions which had been of practical moment from the first. Against the Indians the colonists in the 17th century had provided for their own defence. Chiefly with this object in view, each colony had developed a militia system, modelled in general after that of England. But such a force was not fitted for long campaigns or large operations. It was comparatively undisciplined; both officers and men were inexperienced and destitute of proper habits of command, as well as those of subordination; the commissariat was poor or totally lacking, and the men were able to remain away from their homes for only brief periods. The colonists possessed no navy, and for coast defence only a few rude forts. So poor were means of communication and so isolated were the colonies from one another, that co-operation in joint expeditions was very difficult. Equally difficult was it to secure proportional contributions of money from the colonies. Early in the French wars the British government prescribed quotas both of men and money to be raised by the colonies, but little attention was paid to these except by the colonies which were in immediate peril. Because of the limited amount of available money and the modest resources of the colonists heavy taxation was impossible, and the financing of the wars was a matter of great difficulty. The assemblies resorted to the issue of bills of credit, to which they gave the legal tender quality, and for the redemption of which in nearly all cases they made inadequate provision. The paper depreciated and in some colonies became worthless. Great confusion resulted, involving loss to all, and among the sufferers were British merchants. Strained relations were produced between the assemblies and the colonial executive, because the latter, acting under royal instructions, persisted in vetoing bills for additional issues of currency. For this reason, in addition to others, the assemblies withheld the salaries of governors and other officials, and in this way sought to coerce the executives into submission. In some colonies the Assembly secured the right of electing the treasurer, and in most of them appropriations were made specific. Thus by skilfully utilizing their control over the purse, and that during a long period of war, the colonial assemblies were able materially to limit the authority of the executives and to establish not a few privileges for

themselves and their constituents. It was in such ways as these that the constitutions of the provinces became developed and liberalized during the French wars. Many a precedent was then established which was utilized in the later struggle with the mother country. The home government on its part also became convinced that requisitions were altogether inadequate as a method of procuring revenue for general purposes.

42. The quality of the rank and file of the Canadian militia was not essentially different from that of the British colonies. But the Canadian government was autocratic. The power of the French was also concentrated in a single large province, and not distributed among thirteen or more colonies. These conditions greatly promoted military efficiency. When taken in connexion with their Indian alliances, they enabled the French to take the offensive in the earlier wars much oftener than did the English, and with much greater effect. The government at Quebec was not subject to the limitations of quotas and requisitions. There were no assemblies to thwart its will. The English frontier was also more accessible and more exposed than was the lower part of the valley of the St Lawrence. Quebec was in every sense a citadel to which additional security was given during a large part of every year by the intense cold of the Canadian winter. But so superior were the training and enterprise of the French *coureur de bois* that, with his Indian allies, he was far better able than the English farmer or artisan to penetrate the wilderness, whether in winter or in summer, and massacre the exposed dwellers on the frontier. It was this class which gave the French the superiority in the long succession of raids by which the English frontier was laid waste.

43. Though the French by their skill and boldness achieved a remarkable success, their defects and weaknesses were equally evident. The flow of population from France to America was never great, and even it was diminished by the exclusion of Huguenots. The natural growth of population within New France was not rapid. The result was that the French colonists did not become sufficiently numerous to maintain the interests to which their vast claims and possessions gave rise. The disparity between their numbers and those of the British colonists became greater with every generation. At the opening of the last intercolonial war the proportion of English to French colonists was approximately 15 to 1. New York alone had about the same population as that of all the French colonies on the North American continent combined. The resources of the British exceeded those of the French colonists to a corresponding degree. Had the decision of the questions at issue depended upon population and wealth alone, the issue could not long have remained doubtful. But the tendencies arising from these fundamental conditions were to such an extent offset by other circumstances, already alluded to, that the result of the struggle was for a long time uncertain. Had it been confined to the forces of the colonies alone, it would perhaps never have been decided. The English could have defended the territory which they occupied; so could the French. Moreover, with the French and English thus facing one another, it would have been impossible for the latter to have declared their independence. The French would never have desired to do this. Therefore, the two peoples must apparently have remained in the condition of colonists for an indefinite period. But the motherlands were to be the decisive factors in the problem, which thus depended to an extent on complications which existed in Europe or even on remoter seas and continents. When the climax of the struggle was reached the result might have been different if France at the time had not been so deeply involved in the politics of central Europe.

44. Of the first importance in reaching a decision were the fleets and armies of Great Britain and France, or those parts of them which were available for use on the continent of North America. During the larger part of the period under review the French neglected their fleet, while the English steadily advanced toward naval and commercial supremacy. But the first conspicuous service on the northern coasts was that which was rendered by Commodore Peter Warren and his squadron at the capture of Louisburg in 1745. In the next year a large French fleet was despatched to North America, but it accomplished nothing. In the last intercolonial war the operations before Louisburg in 1758 and at Quebec (*q.v.*) in 1759 decisively proved the superiority of the British navy. The colonies also, in the later stages of the struggle, contributed loyally toward the result. France failed to make her natural military superiority effective in North America, and therefore her power on that continent had to yield before the combined attacks of Great Britain and her colonies by land and sea.

D.—*The Colonial Revolt, 1763-1776.*

45. The Treaty of Paris (1763), by which the period of colonial wars—but not the struggle between England and France—was concluded, added vast stretches of territory to the dominions of Great Britain in North America. The Floridas, Canada and Louisiana as far west as the Mississippi river now came into the possession of the English. Of the islands which were occupied, the two most important—Guadaloupe and Martinique—were restored to the French. The retention of Canada in preference to these involved an important change in the nature and objects of British colonization. Hitherto tropical colonies had been preferred to those in northern climes. The occasion of this had been the view that, as England was not over-populated, colonies were not needed as "homes for a surplus population." Instead, they were estimated in proportion to their commercial value. The ideal was a self-sufficing commercial empire. The supporters of this view now argued that the islands which had been conquered from the French were more valuable than Canada and should be retained in preference to the northern continental territories, which had yet produced nothing for export except furs. But the government did not hesitate. Following the lead of Pitt, it was now bent upon continental expansion. Canada and the West were retained and the most important French islands were given back. The development of modern industry—the so-called industrial revolution—had already begun in Great Britain. Its effect was vastly to increase the population of the British Isles and to necessitate an overflow into the unoccupied regions of the globe. Colonies therefore began to be regarded from this point of view, and the retention of Canada opened the way for the change. Henceforth, as time progressed, colonies were to be valued as homes for a surplus population quite as much as sources of raw materials and food supplies. The retention of Canada and the West also coincided exactly with the desires of the continental colonies. The chief gains of the war went therefore to them and not to the island colonies. They now possessed a continental domain which was adequate to their need for expansion, and their long-cherished desire to be rid of the French was gratified. Though, as expansion progressed, conflicts with the Indian tribes of the interior, and that on a large scale, were to be expected, the conquest of the French removed the sense of dependence on Great Britain for military aid which the northern colonies in particular had previously felt.

British Acquisitions of Territory.

46. In consequence of the policy thus adopted, largely increased burdens were devolved on the imperial government, while the conquest and the events which led to it strengthened imperialist sentiment and ambitions. The course of action which was at first favoured by leading officials, both in England and the colonies, was a more systematic administration of Indian affairs, the employment of sufficient regular troops under the commander-in-chief to defend the newly acquired territory, the maintenance of posts with English settlers in the interior on a scale sufficient to prevent the French or Spanish from securing the trade of the region. Improved methods of administration were urged through the press by Thomas Pownall, Henry McCulloh, Francis Bernard and Dr John Campbell. French methods were praised and

Changed Colonial Policy of Great Britain; Strengthening of Imperial Control.

the shortcomings of the surviving chartered colonies were again emphasized. This all required additional revenue, as well as administrative vigour, and that at a time when Great Britain was specially burdened with debt and when several of the colonies had recently incurred heavy expenditures. The large acquisitions of territory also necessitated some changes in the acts of trade. The necessity for their more vigorous enforcement was revealed by the existence of a large contraband trade between the colonists and the enemy during the later years of the war and also of a considerable illegal trade with Europe. These conditions, together with the conviction that, as the continental colonies had reaped the chief advantages of the war, some favour should be extended to the islands, led to the passage of the Sugar Act by the Grenville ministry in 1764. It also caused a resort to writs of assistance in two of the colonies, and finally the legalization of them in all the colonies by act of parliament (1767). The aid of the navy was directly invoked in the enforcement of the trade laws, and the activity of the customs officials and of the admiralty courts in the colonies was increased. Garrisons of regular troops—numbering several thousand—with a commander-in-chief were now present in the colonies in time of peace, and their aid might possibly be invoked by the civil power to suppress disorder. The Sugar Act itself was a trade and revenue act combined, and the fact was expressed in the preamble of the measure. It was intended directly to affect the traffic between the northern colonies and the foreign West Indies in lumber and food-stuffs, molasses and rum. The duty on foreign molasses, for which provision had been made in the Molasses Act of 1733, was halved; but now it was proposed really to collect this duty. A cry was immediately raised in New England that, if the duty was collected, the manufacture of rum—of which molasses was the staple material—would be lessened or wholly prevented and a most important industry sacrificed. The fisheries would incidentally suffer. The supply of coin, with which colonial balances were paid in England, they also said, would be lessened. Another act of parliament, passed about this time, prohibited the bestowment of the legal tender quality on colonial bills of credit. Though parliament regarded this act as a necessary remedy for the excesses of which many of the colonies had been guilty in the issue of paper money, it was generally regarded in America as a blow at a necessary system of credit. In spite, however, of the opposition and criticism which it provoked in the northern colonies, it is probable that the Sugar Act could have been permanently enforced. The Act of Trade of 1673 and the Molasses Act—though the latter was not fully executed—were two early instances of the exercise by parliament of the right to tax the colonies. Had the Sugar Act been enforced, a clear and decisive precedent in favour of this right would have been established. In view of the general situation, that was probably as far as the British government should have gone at that time. But it immediately committed itself to another and still more significant measure, and the two acts combined caused an outburst of protest and resistance from the colonists.

47. Repeatedly in earlier years the imposition of a stamp duty upon the colonies had been suggested. Archibald Cummings, William Keith, ex-governor of Pennsylvania, and Governor George Clinton of New York had prominently urged this policy. With the outbreak of the fourth intercolonial war comprehensive plans of parliamentary taxation were repeatedly proposed. The cost of the regular troops which must be stationed in America was estimated at about £300,000 annually. The Sugar Act was expected to yield about £45,000 a year. It was thought that the colonies should raise about £100,000 more as their reasonable share of the cost. George Grenville resolved to secure this by means of a stamp duty. This would fall upon the island colonies equally with those of the continent, though it would be expended chiefly for the enlarged military force on the mainland. Though its simplicity and ease of collection recommended it, the Stamp Act was a purely fiscal measure, and its character was not concealed by any features which allied it to the earlier acts for the regulation of trade. It involved an extension of the British system of stamp duties to the colonies, and was intended to draw revenue directly from many lines of their activity. It was passed by parliament in 1765, almost without debate and with scarcely a thought that it would be resisted. It provided for the appointment of officials to distribute the stamped papers in the colonies and further extended the power of the admiralty courts by giving them jurisdiction over violations of this act. The legal theory upon which the act was based was that of the unqualified sovereignty of parliament as the representative body for the whole empire, and that its authority, if it chose to use it, was as effective for purposes of taxation as for the regulation of trade or other objects of legislation. But never before, during the century and a half of colonial history, had the taxing power been so unqualifiedly exercised or in such trenchant force as by this statute. It followed close on the heels of the Sugar Act, which itself had aroused much hostile criticism. The two measures also came at a time when the consciousness of strength among the colonists had been increased by the defeat and expulsion of the French. Moreover, at the time when the policy was initiated, George III. had undertaken to crush the Whig party and to revive the latent prerogatives of his office. This resulted in the formation of a series of coalition ministries. Vacillation and uncertainty were thus introduced into the colonial policy of the government. The royal policy also brought into the public service in England and kept there an unusually large group of inferior men who persistently blundered in the treatment of colonial questions. It was only with the accession of the North ministry, in 1770, that permanence and a certain consistency were secured. But, in the view of the colonists, the prestige of the government had by that time been seriously lowered, and the stubborn self-will of the king became the only available substitute for broad and intelligent statesmanship.

Stamp Act.

48. Determined opposition to the Stamp Act was shown in all the colonies, by or before the time (Nov. 1) when it was to go into effect. The forms assumed by this opposition were such as characterized the entire controversy with Great Britain until the opening of hostilities in 1775. It consisted in the passage of resolutions of protest by the lower houses of some of the colonial legislatures; in the calling of a congress at New York, which was attended by delegates from nine of the colonies; in the activity of mobs organized under the name of the "Sons of Liberty" in all the large seaports and in some smaller inland towns; and, finally, in a somewhat widely extended movement against the importation of British, or even foreign, goods and in favour of frugality and the encouragement of home manufactures. The newspaper press also sprang into much greater activity than ever before, and many notable pamphlets were published in defence of the colonial cause. The most important resolutions at the outset were those adopted by the Virginia House of Burgesses and by the House of Representatives of Massachusetts. Through the first-named body the dramatic eloquence of Patrick Henry (*q.v.*) forced five resolutions. Two others, which threatened resistance and the coercion of any who should venture to uphold the home government, failed to pass, but the whole seven were published broadcast through the colonies. The calling of a general congress was proposed by the House of Representatives of Massachusetts. Prominent among its members was James Otis, who had already distinguished himself by radical opposition to measures of the government, especially in the case against writs of assistance which was argued before the superior court in 1761. Samuel Adams (*q.v.*), already a prominent man, was now elected a member of the house from Boston. He almost immediately became its leader, drafting its most important resolutions and papers, and to a large extent directing its policy. With the aid of others he was able greatly to increase the activity of the town-meeting in Boston, and in the course of a few years to develop it on occasion into a great popular convention, which could be utilized to overawe the government. Throughout New England the town and its institutions served well the purposes of opposition and

facilitated its extension over large areas. The county system of the provinces along the middle and southern coast was not so well adapted to these purposes, and their population was more dispersed. The intense Puritan spirit, with its century and a half of pronounced independence, both in polity and temper, was also lacking outside New England; though on the frontiers of the provinces from Pennsylvania southward was a Scottish-Irish population which exhibited many of the New England characteristics. But the tenant farmers of New York, the German pietist sects of Pennsylvania, the Quakers wherever they had settled, and in general the adherents of the English Church were inclined toward indifference or, as the controversy progressed, toward positive loyalism. Hence the mixture of nationalities in the Middle Colonies greatly increased the difficulty of rousing that section to concerted action. In Pennsylvania the issues were obscured by a struggle on the part of the western counties to secure equal representation with those of the east. This helped to make loyalists of the Quakers. Special grievances also produced among the frontier settlements of North and South Carolina quite as much dislike of the officials and social leaders of the tide-water region as they could possibly feel toward Crown and parliament. Throughout the struggle New England and Virginia exhibited a unity and decision in action which were not equalled elsewhere.

Colonial Opposition.

49. But to return to the Stamp Act. Before the meeting of the Congress at New York outbreaks of mob violence in Boston had forced the stamp distributor there to resign, and had wrecked the house of Thomas Hutchinson, the chief justice. Owing largely to the indecision of the elective council, the government had proved powerless to check the disorder. The resolutions passed by the Congress, as well as its petitions to the home government, gave authoritative form to the claims of the colonial opposition in general, though the body which issued them, like all the congresses which followed until 1776, was extra-legal and, judged by the letter of the law, was revolutionary. In these utterances, as later, the colonists sought to draw their arguments from British precedents and their own history. As they owed allegiance in common with subjects within the realm, so the rights of the two were the same. The two British rights which, it was claimed, were violated by the Stamp Act were the right to trial by jury and the right to be taxed only by an assembly in which they were represented. The former grievance was simply an incident of the latter, and was occasioned by the extension of the jurisdiction of the admiralty courts. The tax was a direct grievance. Therefore, for purposes of legislation like this these bodies denied that parliament was representative of the whole empire (so-called virtual representation), and asserted that it represented only the realm. For purposes of taxation, their assemblies, they affirmed, were the only representative bodies they had known. Therefore, ignoring the earlier and tentative measures by which parliament had actually taxed the colonies, and falling back upon the sweeping declarations of their assemblies, they denied the right of parliament to tax them. They declared that the recent policy of parliament was wholly an innovation and insisted upon a return to the Constitution as it was before 1763. The doctrine of natural right and compact was also resorted to with increasing emphasis in New England utterances. For purposes of government they had all along acknowledged—and now did so expressly—that parliament bound them; and the inference would have been fair that they were represented in it. But they did not draw this inference, nor did they seek by any scheme of reform to secure representation in the imperial legislature. James Otis was the only colonial leader who ever contemplated the possibility of such a solution. Adams early declared it to be undesirable. The British never proposed it, and therefore it played practically no part in the discussion.

50. The decisive blows, however, were struck by the mobs in the colonies and by the government itself in England. As the time for the execution of the Stamp Act approached, more or less violent demonstrations occurred in New York and in many other localities. The stamp distributors were forced to resign. Everywhere in the original continental colonies the use of stamped papers was prevented, except to a slight extent in Georgia. Business requiring the use of stamps was in part suspended, but far more generally it was carried on without their use. Without the aid of the militia, which in no case was invoked, the colonial executives proved indisposed or powerless to enforce the act and it was effectively nullified. In England the petitions of the colonists produced little effect. There the decisive events were the accession of the Rockingham ministry to power and the clamours of the merchants which were caused by the decline in American trade. What might have happened if Grenville had remained in office, and if the duke of Cumberland had not been suddenly removed by death, it would be impossible to tell. But the serious lack of adjustment between British politics and colonial government is illustrated by the fact that, more than three months before the Stamp Act was to go into effect, the ministry whose measure it was resigned, and a cabinet which was indifferent, if not hostile, to it was installed in office. Preparations were soon made for its repeal. The slight extent to which relations with the colonies had been defined is indicated by the fact that the debates over the repeal contain the first serious discussion in parliament of the constitution of the British Empire. While the colonies were practically united in their views a great variety of opinions was expressed in parliament. On the question of right Lord Mansfield affirmed the absolute supremacy of parliament in realm and dominions, while Camden and Pitt drew the same sharp line of distinction between taxation and legislation upon which the colonists insisted, and denied the right of parliament to tax the colonies. The debates at this time gave rise to the fancied distinction between internal and external taxes, of which much was made for a few months and then it was dropped. But motives of expediency, arising both from conditions in the colonies and in England, proved decisive, and in the spring of 1766 the Stamp Act was repealed, while its repeal was accompanied with the passage of a statute (The Declaratory Act) affirming the principle that Great Britain had the right to bind the colonies in all cases whatsoever. This measure was received with demonstrations of joy in the colonies, but the prestige of the home government had received a severe blow, and the colonists were quick to resent further alleged encroachments.

Repeal of the Stamp Act; the Declaratory Act.

Townshend Acts.

51. These soon came in the form of a colonial Mutiny Act and of the so-called Townshend Acts (1767). The former was intended largely to meet the needs of the troops stationed in the West and in the new colonies, but it also affected the older colonies where garrisons of regular soldiers existed. The act provided for a parliamentary requisition for barrack supplies, and partly because it included certain articles which were not required for the soldiers in Europe, the New York legislature at first refused to make the necessary appropriation. Partly through the influence of the governor, it later came to think better of it and in a non-committal way appropriated the supplies required. But meantime in England the Pitt-Grafton ministry had come into office, in which the brilliant but reckless Charles Townshend was chancellor of the exchequer. Pitt himself was disabled by illness, and the ministry, lacking his control, steadily disintegrated. Townshend availed himself of this situation to spring upon his colleagues and upon parliament a new measure for colonial taxation, and with it a bill legalizing writs of assistance and establishing a board of commissioners of the customs in America, and a third bill suspending the functions of the assembly of New York until it should comply with the terms of the Mutiny Act. These Bills all became law. Before the last-mentioned one reached the colonies, the New York Assembly had complied, and therefore the necessity for executing this act of parliament was avoided. The establishment of a customs board at Boston, of itself, did not provoke much criticism. But the Act of Trade and Revenue, which provided for the collection in the colonies of duties on glass, lead, painters' colours, paper and tea, and that out of the revenue

raised therefrom salaries should be paid to the governors and judges in America, opened anew the controversy over taxation.

52. John Dickinson, in his *Letters of a Farmer* (1767-1768), denied *in toto* the authority of parliament to tax the colonies, and his argument was widely accepted. Massachusetts petitioned the home government, and in a circular letter conveyed its views to the other colonies and asked an expression of theirs in return. This provoked Hillsborough, the incumbent of the new colonial secretaryship, to order the Massachusetts house to rescind its action and the other colonies to treat the letter with contempt. The Massachusetts assembly refused to rescind and was dissolved by the governor. The activity of the customs officials at Boston in seizing John Hancock's sloop, "Liberty," occasioned rioting, which in turn was followed by the transfer of two regiments to Boston. Several vessels of war were also stationed in its harbour (autumn of 1768). Deprived of their assembly, the towns of Massachusetts chose deputies, who met in convention, but without important result. Favourable replies to its circular letter were, however, received from a majority of the colonies. Resolutions against the new act were passed by many colonial assemblies, and in several cases petitions were sent to England. But, either because these addresses were not sent through the regular constitutional channels, or because they expressed views inconsistent with the Declaratory Act, they were laid on the table or rejected outright. The king and ministers expressed the view that the Americans were opposed to all restrictions, and that in Massachusetts treason or misprision of treason had already been committed. In this they had the support of large majorities in parliament. The statute of 35 Henry VIII., for the punishment in England of such offences when committed outside the realm, was now revived, and the royal officials in Massachusetts were instructed to collect evidence against suspected popular leaders with a view to their deportation across sea for trial. Though sufficient evidence was not found, nothing could have been better calculated to increase the exasperation of the colonists than a threat of this kind. It drew from the Virginia burgesses strong addresses and resolutions of protest. Fear lest the English Church would induce the government to establish a colonial episcopate caused much discussion at this time, especially in New England, and led to plans for joint action on the part of Dissenters, in self-defence. Though the government never sanctioned the plan, the fears which were aroused by its discussion contributed appreciably to the general agitation. In the course of 1769 the policy of commercial non-intercourse was again revived, and resolutions in favour of its enforcement were passed by many local bodies. But it was found difficult to enforce these, and, as the colonies were prosperous, trade, open and illicit, with Europe continued to be large. The British merchants did not clamour for relief, as they had done at the time of the Stamp Act, but gave loyal support to the policy of the government. The king was also steadily gaining an ascendancy, which in 1770 was permanently established by the accession of Lord North to the premiership. Thus, on both sides of the ocean, parties were bracing themselves for a struggle, the one for and the other against the principle of the Declaratory Act. The question of revenue was now largely obscured by that of right and power.

Tea Tax.

53. It cannot be said that the Townshend Revenue Act was nullified, for to a certain limited extent it was executed. But in 1770, on the specious plea that the duties were uncommercial because they were levied on British manufactures, all except the duty on tea—3d. per lb—were repealed, and a drawback of one-fourth and later of three-fifths of this duty was granted on the re-exportation of tea to the colonies. But the preamble of the act was retained, and with it the principle of taxation. For this reason opposition continued and non-importation agreements, especially against tea, were maintained. But after the collision which occurred between the troops and the people in Boston, in March 1770, the soldiers were removed from that town and affairs became more quiet. For more than a year it seemed as if the controversy was wearing itself out and that the old relations would be restored. But the conduct of certain naval officers and small vessels of war which had been trying to suppress illegal trade in Narragansett Bay led, in June 1772, to the destruction of the schooner "Gaspee." The inquiry which necessarily followed this, together with legislation for the protection of the royal dockyards, ships and supplies, again revealed the possibility that colonists might be removed to England for trial. About the same time provision was made for the payment by the home government of the salaries of the governors and of the judges of the superior court of Massachusetts while those officials continued to hold at the pleasure of the Crown. These events occasioned a movement in Massachusetts and Virginia which led at once to the organization of committees of correspondence, and these ultimately extended far and wide throughout the colonies. At the same time in England the East India Company appealed to parliament for relief from the losses caused by the transfer of the American trade so largely to the Dutch, and in response the Tea Act was passed authorizing the company to import its teas into the colonies and providing that the English duties should be wholly drawn back on exportation, and that no compensation need be made to the government for consequent loss of revenue. This, it was expected, would enable the company to out-compete the Dutch. But popular uprisings prevented the reception or sale of the tea at any of the ports and culminated in the destruction (Dec. 16, 1773) of 340 chests at Boston. As the king and the North ministry were now fully intrenched in power, coercion was at once resorted to and affairs were thus brought to a crisis.

Quebec Act.

54. Those among the colonists who were intelligent enough to watch the course of events had long felt that they were being enveloped in a network of relations over which they had no control. This was a result of the development of the empire, with its world-wide interests and its policies the motives for which had their origin in conditions which by the colonists were dimly perceived, if perceived at all. They were particularists whose views and resources were alike narrow, but whose perception of their interests was clear. The Quebec Act, which was passed by parliament near the close of the session of 1774, furnished a case in point. Owing to the failure of the imperial government to secure the revenue which it had hoped to collect under the Stamp Act and the later statutes, it had been forced to abandon its plans for the vigorous administration of Indian affairs and of the West. In view of these facts, it was thought wisest and cheapest to commit the immediate charge of the West to the province of Quebec, and therefore to extend its bounds southward to the Ohio. The Roman Catholic religion was recognized as legal within Quebec, and no provision was made for an assembly. Its extension also indicated a purpose to prevent the westward movement of population across the mountains, which was already beginning from the Middle and Southern colonies. It is true that this act involved the possibility of danger to the colonies, but exaggerated inferences were drawn respecting it and the motives which probably impelled its passage. So it had been with the distinctively imperialist measures from the first and so it was to continue.

55. But the acts of the session of 1774 which were of most immediate importance were those which directly affected Massachusetts, where lay the centre of disturbance. One of these closed the port of Boston, another substituted an appointed for an elected council in Massachusetts and took the selection of jurors out of the hands of the people, and a third made possible the removal from Massachusetts of the trials of persons indicted for capital offences committed in support of the government into neighbouring colonies or to Great Britain, where a fair hearing was considered possible. General Thomas Gage, who had been commander-in-chief in America, was now appointed governor of Massachusetts, with authority to uphold the new acts with military force. As soon as knowledge of the fate impending over Boston reached the other colonies, conventions, local and provincial, were held, and the plan of a general congress, as proposed by Massachusetts and Virginia, was adopted. Delegates were chosen from all the colonies except Georgia, though that province fell into line when the

second Congress met. The members were instructed to the general effect that they should consult together and adopt such measures as were best calculated to secure the just rights of the colonists and redress their grievances. Voting by colonies, but occasionally listening to utterances which implied that Americans were now thrown into a single mass, this body sent addresses to the king, to the people of the colonies, of Quebec and of Great Britain, and prepared a declaration of rights. It is a significant fact that an address was not sent to either of the houses of parliament. In its statement of rights the Congress (known as the First Continental Congress) limited itself to those which it believed had been infringed since 1763. These acts they described as innovations, and claimed themselves to be the true conservatives who only desired peace on the basis of the former Constitution. Even Joseph Galloway's elaborate plan of union (see GALLOWAY) between Great Britain and the colonies was debated at great length and was laid on the table by a majority of only one, though later all reference to it was expunged from the record. But, on the other hand, the warlike "Suffolk Resolves" (see MILTON, Mass.) were approved, as was the opposition which Massachusetts was making to the recent acts of parliament; and the view was expressed that, if an attempt were made to execute them by force, all America should support Massachusetts. Though the work of this Congress was deliberative, it performed one positive act which contained the germ out of which new governments were to develop. That was the issue of the Association, or non-importation and non-exportation agreement, accompanied with resolutions for the encouragement of agriculture and home manufactures and for the organization of committees to carry these measures into effect. Coercion, according to the principle of the boycott, was to be applied by the colonies and other local bodies to all who declined to accept and obey the terms of the Association. This policy had been followed at intervals since the time of the Stamp Act. It had been revived and urged by very many local and provincial bodies during the past few months. The Congress had been called with a view to its enforcement throughout the continent. Its issue of the Association gave this policy wide extension, and at the same time strengthened the system of committees, whose energies were henceforth to be chiefly devoted to its enforcement. The Association became the touchstone by which loyalty to the colonies, or loyalty to the king, was determined. Those whose loyalty to the king forbade their submission to the new regulations now felt the coercive power of committees, even to the extent of virtual trial, imprisonment or banishment. Local bodies, acting under general regulations of Congress, and all revolutionary in character, accomplished these results and thus laid the foundation of the new governments. From this action the First Continental Congress derived its chief significance.

First Continental Congress.

The Association, or Non-Importation and Non-Exportation Agreement.

56. The line of policy thus indicated was not such as would conciliate the home government, though it is doubtful if at that time anything short of an acknowledgment of the principle of the Declaratory Act would have been effective. All measures of congresses and committees, everything which did not emanate from the assemblies and come through legal channels, savoured of sedition and was little likely to secure a hearing. The Association, with its threats and coercive spirit, and depending as it did upon extra-legal bodies for enforcement, was a direct blow at the commercial system of the empire and could scarcely help provoking retaliation. When the Congress adjourned, some of its members predicted war. In New England the impression that war was inevitable was widespread. In Massachusetts a provincial congress was at once organized, which assumed the reins of government and began to prepare for defence. A committee of safety was chosen to carry on the work during recesses of the Congress. Thomas Gage, the governor, began fortifying Boston, while he looked about for opportunities to seize military stores which the colonists were accumulating. The raising of voluntary militia companies was soon begun in Virginia. In South Carolina, as earlier in Boston and New York, a quantity of tea was now actually destroyed, and a general committee assumed practical control of the province. From New York City and Philadelphia as centres the process of revolutionizing the two most conservative provinces was carried on. When parliament met, at the close of 1774, the king and ministers declared that a most daring spirit of resistance existed in Massachusetts, which was countenanced by the other colonies, where unlawful combinations against the trade of Great Britain were already widely extended. In these opinions the government had the support of the majority in the two houses, and in a joint address the rebellion in Massachusetts was declared to be a fact. As a conciliatory measure Chatham proposed that parliament agree by resolution not to levy any tax upon the colonies, but that the Continental Congress be required to make a free grant of a perpetual revenue which should be fully at the disposition of parliament, the Congress fixing the quota which should be paid by each province. But the imperialist and mercantilist ideas of Chatham were expressed in the further provisions that the system of trade and navigation should not be changed and that the army might be lawfully kept in any part of the dominions where it was deemed necessary, though it should never be used to violate the just rights of the people. Edmund Burke, in his great speech on conciliation, advocated a return to the system of requisitions and did not consider a representation of the colonists in parliament as a possibility. But these motions were rejected, and a resolution introduced by Lord North was passed. This contained no recognition of extra-legal bodies, but provided that when the assembly of any colony should engage to support civil government within the colony and contribute according to its ability to the common defence, the king and parliament would then forbear to levy any more taxes on that province except what were necessary for the regulation of trade. The colonies, with the exception of New York, North Carolina and Georgia, were excluded from the fisheries, as a counterstroke to the Association. North's resolution proved utterly futile, and the two parties drifted steadily toward war, though, as Burke never tired of asserting, the British government in its military estimates made no adequate provision for meeting the crisis.

Outbreak of Hostilities; Lexington and Concord; Bunker Hill.

57. On the 19th of April 1775 hostilities began in Massachusetts. They had been narrowly escaped two months before, when, on a Sunday, Gage had sent an expedition by water to Salem in search of powder. Now, on a week-day, a force was sent overland to Concord, 20 m. from Boston, to seize or destroy the military stores which the colonists had brought together at that village. The minute-men were warned to oppose the approaching force, and at Lexington (*q.v.*), a village situated on the road to Concord, occurred a skirmish in which the first blood of the American War of Independence was shed. The troops marched on to Concord (*q.v.*) and destroyed such of the stores as had not been removed or concealed. On their return march they were pursued by a galling fire from behind fences and buildings, and had it not been for the arrival of a relieving force the command would have been destroyed before it reached the protection of the British vessels of war at Boston. The "Lexington alarm" brought in throngs of militiamen from all parts of New England. Officers were appointed by the provincial congress of Massachusetts and by similar bodies in the other colonies, and immediately the so-called siege of Boston began. Cannon, as well as every other form of military equipment, were now in great demand. In order to secure a supply of the former and at the same time strike a telling blow at British authority in the north, Ticonderoga (*q.v.*) was surprised and taken on the 10th of May. Men from Connecticut, Massachusetts, and the New Hampshire Grants (later Vermont) co-operated in this enterprise. It was soon followed by a dash into Canada, by steps which involved New York in the affair, and by the organization of a military force under General Philip Schuyler for permanent service on the northern frontier.

Meantime reinforcements reached Boston, led by Howe, Clinton and Burgoyne, and it was resolved to extend the British lines by occupying the heights of Dorchester on the south and those of Charlestown on the north. The Americans, hearing of this, seized Breed's Hill, overlooking Charlestown, where they hastily threw up a redoubt on the night of the 16th of June. The British might easily have entrapped them, but instead on the next day the American position was assaulted on the left and carried, though with much difficulty and after a loss to the assailants of more than 1000 men. Such was the battle of Bunker Hill (*q.v.*), one of the most dramatic encounters in the war which was then beginning. In connexion with all these events the Americans, as in their earlier conventions and manifestoes, claimed to be acting on the defensive. But it was not difficult to perceive that, especially in New England, this claim only imperfectly concealed an intensely aggressive spirit. (For military events of the war, see AMERICAN WAR OF INDEPENDENCE.)

58. The news of the outbreak of hostilities aroused strong feeling throughout the colonies. The Second Continental Congress met under its influence. Its members, however, had been chosen and instructed before the clash of arms, and for that reason the course which had been worked out for them differed only slightly, if at all, from that which had been followed by their predecessors. To a certain extent the new body adhered to the former course of action. But a state of war now existed in New England and on the Canadian border. Troops were expected soon to arrive at New York. Reports of these events were thrust upon the attention of Congress at once, and the provinces involved asked for advice as to what course they should pursue. The northern frontier especially demanded attention. As a result of these events in the colonies generally the Association was being changed from a system of co-operation against British trade into a union for purposes of defence. This new situation the Congress was forced to meet. This it did largely by resolutions of advice to the colonies, but also by positive orders. Of the former class were the resolutions about the procuring of military supplies, the assumption of powers of government by the various colonies, and concerning defence at New York City, on the northern frontier and, later, in the Highlands of the Hudson. Of a more decisive character was the appointment of officers for the army, George Washington being made commander-in-chief, the prescribing of their pay, the issue of continental bills of credit, the issue of articles of war, the regulation of trade and of Indian affairs, and the establishment of postal communication. As the colonies were passing through a strong reaction against executive authority, the Congress did its business with the help of temporary committees and did not seek to establish a permanent executive. The same was true for a time of the congresses and conventions in the different colonies. As the movement progressed through 1775 and the early months of 1776, executive authority in the royal and proprietary provinces collapsed. The assemblies were either dissolved or ceased to meet. The governors, their authority gone, retired on board British vessels of war, returned to England or, perchance, found themselves prisoners in the hands of the revolutionists. This gradual fall of the old governments, imperial and colonial, was the revolution on its negative side. The rise of the system of congresses, conventions and committees, deriving their authority from the people, was the revolution on its positive side, and foreshadowed the new federal system which was rising on the ruins of the half-federated empire. The process in the different colonies was as varied as were their social and political conditions.

Second Continental Congress.

59. In Connecticut and Rhode Island the corporate system of government, which they had inherited from the 17th century, necessitated no change. The general assemblies always had been the centres of power, and the leading officials were elective for short terms and were subject to the control of the electorate. So far as the internal organization of the colonies was concerned that was all which the revolution demanded. In the two proprietary provinces—Pennsylvania and Maryland—the executives were not so directly interested and pledged to support the imperial government as were those of the royal provinces. But Governor Robert Eden of Maryland was so tactful that, though the last Assembly met in 1774, he was able, with the courts, to keep up some form of government there in the name of the Crown and proprietor until the early summer of 1776. In Pennsylvania the proprietors, though in sympathy with the British government, never sought actively to influence events in their province. So strong was the conservative spirit there that the proprietary Assembly even met—though without a quorum—as late as September 1776, at the time when the convention was completing the first constitution of the state. In the royal provinces the prorogation of the legislatures for indefinite or prolonged periods caused them early to disappear—that of Massachusetts in October 1774. The burgesses of Virginia last met for business in May 1774. They were prorogued to several later dates, but the governor was never again able to meet them. The long and important session of January–March 1775 was the last ever held by the New York Assembly. In April 1775 Governor John Martin of North Carolina met the Assembly for the last time, and even then the Provincial Convention was in session at the same time and place and the membership of the two bodies was the same. In May 1775 disappeared the Assembly of Georgia; in June those of New Hampshire and South Carolina met for the last time. Governor William Franklin was able to meet the Assembly of New Jersey as late as November, but months before that date the Provincial Convention had practically assumed the control of affairs. The royal courts and executives continued some form of activity a few months longer and then totally vanished.

Collapse of the Royal Governments.

60. After Bunker Hill the command at Boston had been transferred from Gage to Sir William Howe. In July Washington took command of the colonists and gradually established some degree of order and discipline among them. Though the American levies were raw and ever fluctuating in numbers, the British never seriously attempted to break through their lines. Indeed, it was not the plan of the British to make New England the chief seat of war. As early as the 2nd of August 1775 Lord Dartmouth wrote to General Gage on "the obvious advantages that would attend the taking Possession of New York and the hazard of the Army's continuing at Boston." On the 5th of September he wrote to Howe that every day's intelligence exhibited this fact in a clearer light. Rhode Island was considered as a convenient naval station, and steps were soon taken to secure possession of it and its surrounding waters. This indicates what was necessarily the fact, that the British would so plan the war as to secure the maximum of advantage from their fleet. This would give them an easy command of the entire coast, and enable them to secure a foothold at strategic centres. Hence it was that, though the arrival of a fresh supply of cannon enabled Washington to fortify Dorchester Heights, this simply enabled him to hasten a process for which Howe had long been preparing. The evacuation occurred on the 17th of March 1776, and the British force withdrew temporarily to Halifax. Meantime the bold expeditions of Arnold and Montgomery against Canada—suggesting the joint efforts of the French wars—had met with only a partial success. Montreal had been occupied, but the assault upon Quebec had failed. A small American force awaited the return of spring in Canada, in order that they might renew the struggle for that colony.

Evacuation of Boston; American Expeditions against Canada.

61. The view, as it was now repeatedly expressed by king and parliament, was that the colonists were in open rebellion. North's offer of conciliation was peremptorily rejected by Congress. The acts of parliament were being openly resisted, and Congress in its manifestoes had ignored the two houses. Therefore the British government stood committed to coercion. That was the meaning of the legislation of the winter of 1776—the prohibition of trade with the rebellious colonies, the increase

of the estimates for the army and navy, the employment of German auxiliaries for service in America. Preparations were made to send a large military and naval force against the colonies the following season, and that it should operate in part against the insurgents in New York and the southern colonies and in part through Canada. New England was no longer to be the direct object of attack. The Howes, as commanders of the royal army and navy, were appointed commissioners to grant assurance of peace and pardon and the repeal of the obnoxious acts, provided submission was made and some way could be found by parliament in which an imperial revenue for purposes of defence could be secured from the colonies. Military operations, meanwhile, should be directed against points of least resistance, and in that way, if possible, the union of the colonies should be broken. The trend of British policy indicated that an invasion from Canada might be attempted and the effort be made to hold Charleston, Philadelphia, and especially New York as strategic points on the coast.

62. The course of events in the colonies by which this situation was met was the erection of a system of feeble defences about New York and the removal thither of the army of about 9000 men in the spring of 1776; the fitting out of privateers to prey on British commerce and of a few small armed vessels by the colonies and the general government to watch the coast and procure supplies; the disarming of loyalists; the opening of American ports to the trade of all peoples who were not subject to the British Crown; and the tentative opening of relations with France. As the result of a combination of ill luck, bad management and American energy the British suffered a repulse at Charleston, South Carolina, in June, which was analogous to the affair of the year before at Bunker Hill, and which necessitated a postponement of their plans in the South. The Congress and the various revolutionary bodies in the colonies were forced to carry on war upon a constantly increasing scale. They had to assume powers of government and gradually to perfect their organization for the purpose. Committees in Congress became more permanent. Conditions approximating to those which existed the year before in New England extended through the colonies generally. On the 15th of May 1776, as the result of various earlier applications on the subject, and especially of one from certain Whigs in New York, the Congress recommended to the assemblies and conventions of the colonies where no government sufficient to the exigencies of their affairs had been established, "to adopt such government as shall, in the opinion of the representatives of the people, best conduce to the happiness of their constituents in particular and of America in general." The preamble to this resolution set forth as facts the statements that the colonies had been excluded from the protection of the Crown, that no answer had been given to their petitions for redress, and that the whole force of the kingdom was to be used for their destruction, and therefore that it was no longer reasonable or honest for the colonists to take the oaths or affirmations necessary for the support of government under the Crown.

Organization of State Governments; Declaration of Independence.

Though the preamble was warmly debated, it was adopted. And this act marked a turning-point, for the progress of events from that time to the declaration of independence was rapid and decisive. The colonies—now becoming states—one after another, in response to letters from Philadelphia, empowered their delegates to concur in declaring independence. On the 7th of June R. H. Lee of Virginia introduced in Congress a resolution "that these United Colonies are and of right ought to be free and independent states," that it was expedient forthwith to take effectual measures for securing foreign allies, and that a plan of confederation should be formed. John Dickinson and others, speaking for the Middle Colonies, argued that the order of procedure should be reversed. But John Adams and the more aggressive party insisted that the proposed declaration would simply state the facts and would open the way for foreign alliances; that it was useless to wait for unanimity. The debate showed that the delegates from the Middle Colonies and South Carolina could not act, and so the decision was postponed for three weeks. In the interval steps were taken to draft a plan of treaties and articles of confederation. A board of war and ordnance, the earliest germ of an executive department, was also created by Congress. At the end of the three weeks the delegates from all the colonies except Georgia, South Carolina and New York had received instructions favourable to independence. The two former left their delegates free, and under the influence of the British attack on Charleston they voted for independence. News had just come that Howe had landed with a large force at Sandy Hook—as events proved, it was an admirably equipped army of 30,000 men, supported by a fleet. Under the impression of these stirring events Dickinson and his leading supporters ceased their opposition, and the Declaration, substantially in the form given to it by Thomas Jefferson, was agreed to (July 4, 1776), only three adverse votes being cast. The delegates from New York took no part, but a few days later the act was approved by the convention of that state. The signing of the document by the members took place at a later time. Thus triumphed the tendencies toward self-government which had been predominant in the continental colonies from the first, and which the system of imperial control had only superficially modified and restrained. But the most significant part of the document for the future was the preamble, in which the democratic aspirations of the new nation were set forth, the spirit to which Thomas Paine had just made so powerful an appeal in his *Common Sense*. Governments, it was said, derive their just powers from the consent of the governed, and when any system becomes destructive of these ends it is the right of the people to abolish it and to institute a new government, establishing it upon such principles and under such forms as seem most likely to effect their safety and happiness. (See Independence, Declaration of.)

E.—*The Struggle to Maintain Independence, 1776–1783.*

63. Viewed from one standpoint, the declaration of independence was apparently an act of the utmost recklessness. The people were by no means a unit in its support, and in several of the states widespread indifference to it, or active sympathy with the British, prevailed. In New York, South Carolina and Georgia a condition of civil war came sooner or later to exist. The United States, as yet, had no international status, and it would seem that that must be secured, if at all, by a series of victories which would ensure independence. But how could these be won against the greatest naval power on the globe, supported by veteran armies of continental and British troops? The colonies had no money; the few vessels which, as a collective body, they did send out, were more like privateers than anything else. Their army was an undisciplined throng of militiamen, serving on short enlistments, without organized commissariat, and for the most part under inexperienced officers. Its numbers, too, were far inferior to those of the British. Taxation by the Continental Congress for the support of the war was not among the possibilities of the case. The colonies were struggling against taxation by one imperial body, and it was not likely that they would submit to similar impositions at the hands of another. The Congress, moreover, as has truly been said, was little more than a general committee or interstate council of safety, and had to proceed largely by way of advice.

Finance; Weaknesses and Defects of the American General Government.

A strong tendency also toward the provision for immediate needs by the issue of bills of credit had been inherited from the period of the French wars, and resort was again had to that device. The battle of Bunker Hill had been immediately followed by an order of Congress for the issue of $2,000,000 in that form of currency. Issues followed in rapidly increasing amounts, until by the close of 1779 $241,000,000 had been authorized. The states put out nearly as much ($209,000,000), Virginia and the two Carolinas issuing the largest amounts. All that Congress could do to secure the redemption of its issues was to recommend to the states to provide the means therefor; but this they failed to do, or even to provide for the redemption of their own issues. The continental paper money depreciated until it became worthless, as to a large extent did that of the states also. The states decreed it to be legal tender, and dire threats were uttered against those who refused to receive the bills; but all to no purpose. The Congress also tried to induce the states to tax themselves for the general cause and was forced to rely on requisitions for the purpose. The colonies had insisted that the system of requisitions was good enough for the mother country, but when applied by Congress it proved as complete a failure as when resorted to by the Crown. The revolution was therefore never financed. It early became necessary to resort to loans and that chiefly from foreign sources. It was therefore an absolute necessity that the colonies should secure international recognition and status. Then loans were obtained from the governments of France and Spain and from private bankers in Holland to the amount of about $7,830,000.

64. The collapse of royal government left the colonies in a chaotic state. The old institutions had disappeared and new ones could not be immediately developed to take their place. But the institutions of local government, the town and county systems, were left intact, and upon these as a basis the new fabrics were erected. It was therefore easier to construct the governments of the states than to define and develop the general government. At first little else was intended than that the Congress should be the mouthpiece of the patriot party. It proceeded mainly by way of recommendation, and looked to the states, rather than to itself, as the ultimate sources of authority. Upon them it depended for the execution of its measures. The common will, as well as enactment, was lacking which would have given the force of positive law to the measures of Congress. As the war proceeded the states grew jealous of the central body and tried to prevent appeals to it from the state courts in prize cases. Under the pressure of war, moreover, the enthusiasm, which had been strong at the outset, declined, and it became increasingly difficult to secure co-operation or sacrifice toward any general enterprise. At the same time, war devolved upon Congress an enormous burden of work. It was forced to devise general policies and provide for their execution, and also to attend to an infinite number of administrative details. This was due not only to the exigencies of the time, but to the fact that no general executive was developed. As was characteristic not only of this revolution, but of all others, the committee system underwent an enormous development. "The whole congress," wrote John Adams, "is taken up, almost, in different committees, from seven to ten in the morning. From ten to four or sometimes five we are in congress, and from six to ten in committees again." "Out of a number of members," writes another, "that varied from ten dozen to five score, there were appointed committees for a hundred varying purposes." Upon its president and secretary the Congress was forced to depend not a little for the diligence and ability which was requisite to keep the machine going. But as the war progressed most of the able members were drawn off into the army, into diplomatic service or into official service in the states. Sectional and state jealousies also developed and became intense. By many the New Englanders were regarded with aversion, and members from that section looked with dislike upon the aristocrats from the South. As the Congress voted by states the smaller commonwealths were often moved by jealousy of their larger rivals to thwart important measures. But, above all, the conduct of the war and foreign relations occasioned infinite jealousies and cabals, while many of the most important measures seemed to meet with downright indifference. Washington's correspondence abounds in evidence of these facts, while it is well known that he was the object against whom one of the cabals of the time was directed. Benjamin Franklin was the object of somewhat similar jealousies. But, as time passed, rudimentary executive departments, beginning with the board of war and the postmaster-general, were developed, and some advance was made toward a working and permanent system. In 1781 the offices of foreign secretary, superintendent of finance, secretary of war and secretary of marine were created.

65. For a time, and indeed during most of the struggle, the course of the land war seemed to justify these criticisms and gloomy fears. Until its very close the campaign of 1776, from the American standpoint, was a dismal failure. The battle of Long Island was lost by the Americans and, as at Bunker Hill, it would have been quite possible for the British to have captured the entire force which opposed them on Long Island. Howe compelled Washington to evacuate New York City. On the 16th of November the practical abandonment of the state of New York by the main army was necessitated by the capture of Fort Washington. Earlier in the year the Americans had been compelled to retire from Canada, while the Tories in northern New York were contributing valuable aid to the British.

Fort Washington.

66. But there was another side to the picture, and already certain faint outlines of it might be discerned. The British commander was proceeding slowly, even according to established European methods. At almost every step he was failing to seize the advantages that were within his reach, while Washington was learning to play a losing game with consummate patience and tact. Although he was constantly trying to rouse Congress and the states to more vigorous action, he showed no disposition to break with the civil power. Already, too, the physical obstacles arising from the wooded and broken character of the country, and from the extremely poor means of communication, were becoming apparent to the British; while the Americans always had the alternative, if too hard pressed, of withdrawing beyond the mountains. After Washington had crossed the Delaware, Howe, instead of seizing Philadelphia and driving Congress and the American army to some remote places of refuge, as he might have done. prepared for winter quarters. Washington seized the opportunity to return across the Delaware and surprise the British outposts at Trenton (Dec. 26, 1776) and Princeton (Jan. 3, 1777), and thus secured a safe post of observation for the winter at Morristown. Confidence was to an extent restored, the larger part of New Jersey was regained, and many loyalists were compelled to take the oath of allegiance. Howe's plan for the next campaign involved the strengthening of his army by large reinforcements from home and by all the men who could be spared from Canada. With this force he proposed to capture Philadelphia and thereby to bring the War of Independence to an end in Pennsylvania, New Jersey and New York. New England and the states farther south could then be dealt with in detail. But Howe was overruled by Lord George Germain, the colonial secretary, whose plan included an invasion from Canada, in which Tories and Indians should share, while Howe should advance up the Hudson and meet the northern forces at Albany. If this ambitious scheme should succeed, the British would occupy the valley of the Hudson and New England would be cut off from the rest of the colonies. General Burgoyne was appointed to command the northern expedition. But the failure of the plan was almost ensured from the outset by neglect on the part of British officials to instruct General Howe as to his part in its execution, while Burgoyne was forced to surrender near Saratoga on the 17th of October. Meanwhile, Howe, who had long waited for instructions respecting the northern expedition, was finally informed that he might undertake the Pennsylvania campaign, but with the hope that at its close he would still be able to march up the Hudson. Thereupon, embarking his army, Howe sailed for Chesapeake Bay, at the head of which he landed and advanced towards Philadelphia. Washington's army opposed his march at the Brandywine (Chad's Ford), but was defeated (Sept. 11, 1777) and forced to retire beyond Philadelphia. The British then entered the city (Sept. 26) and the Congress withdrew to Lancaster, and later to York, in the interior of Pennsylvania. The British fleet had in the meantime arrived in Delaware Bay, and, after a prolonged and brave defence, had captured Forts Mercer and Mifflin. When the winter began the Delaware, as well as lower New York and Rhode Island, was in the possession of the British. With the fragments of an army Washington retired to Valley Forge (*q.v.*).

67. But the influence of Burgoyne's surrender in Europe was to prove a turning-point in the war. Since 1763 a strong sentiment at the French court had been favourable to a resumption of war with Great Britain. An opportunity was now presented by the colonial revolt. In November 1775 the Congress created a committee of secret correspondence, which, in April 1777, was developed into a committee of foreign affairs, and this continued until 1781, when the office of foreign secretary was established. To Congress, and to the members who were serving on its secret committee, the possible attitude of France was known from an early date. The necessity of securing supplies and loans from Europe was also imperative, though the United States had nothing to pledge in repayment except the future products of her soil. In February 1776 Silas Deane (*q.v.*) was sent to Paris, ostensibly as a business agent, and with the connivance of the French government supplies were sent to America and American vessels were received into French ports. Soon American privateers were bringing their prizes into French harbours, and British commerce began to suffer from these attacks. On the French side Beaumarchais and others actively co-operated in this. In the autumn of 1776 Congress appointed three commissioners to France, and resolved that Spain, Prussia, Austria and other European states should be approached with a view to securing recognition and aid. In December 1776 Franklin, who, with Deane and Arthur Lee, had been appointed commissioner to France, arrived at Paris, bringing with him proposals for treaties of commerce and alliance. But, though the attitude of the French court toward the Americans was friendly, and though it continued to send secret aid, and to exert a favourable influence upon Spain, yet it could not be induced to abandon its outward appearance of neutrality until after the news of Burgoyne's surrender arrived. Then the real purpose of the French government was revealed. On the 6th of February 1778 the treaties were signed, and in the following summer war between France and England began. The influence of France under the Family Compact was also persistently used to bring Spain into the alliance. The latter was naturally hostile to England, but her aversion to colonial revolts and her desire to substitute mediation for war kept her from declaring against England until April 1779. In October 1779 Henry Laurens (*q.v.*) was elected minister to the Netherlands, and sailed for Europe, taking with him a plan of a commercial treaty. But Laurens and his papers were captured by the British at sea, and partly by that event the Netherlands were forced into war with England. With the other states of northern Europe they undertook to defend the interests of neutrals against the arrogant enforcement by Great Britain of the rights of search at sea. Thus the conflict expanded into a commercial and naval war, Great Britain being confronted by the larger part of Europe.

French-American Alliance.

68. The conclusion of the treaty of alliance by France was immediately followed by the equipment of a fleet under the comte d'Estaing, which sailed from Toulon in April 1778, having on board M Conrad Alexandre Gérard de Rayneval, who had been accredited as minister to the United States, and Silas Deane, who was returning to report to Congress. Sir Henry Clinton had now succeeded Howe in command of the British army. The certainty that a French fleet would soon appear in American waters made it necessary for the British to evacuate Philadelphia and return to a point on the coast where the army could be in easy communication with the fleet. This fact shows how the French alliance had changed the nature of the war. It now became to a large extent a contest between the two navies, the principal evolutions of which occurred in West Indian and European seas. (See American War of Independence.) In the north the British now relatively neglected the land war, and refrained from sending such forces to the eastern coast as had supported Howe in 1776. The Americans, on the other hand, had a naval force upon which they relied, in the hope that the blockade of their coasts might be raised and trade routes opened more freely. On the evacuation of Philadelphia in June Washington's army pursued the British as they retired toward New York, and the indecisive battle of Monmouth was fought on the 28th of June. It did not prevent Clinton from reaching New York, and that city continued to be the centre of British power and operations in the north until the close of the war. The Congress returned to Philadelphia, where Gérard was received, and where he was soon exercising an influence favourable to the policies of Washington and opposed to the clique of which General Horatio Gates was the leader. Washington's army came gradually to occupy a line of forts, of which West Point in the Highlands of the Hudson was the citadel. From there as a centre it was possible to communicate with Newport on the east and with the Delaware region on the south, and at the same time to prevent the British from gaining access to the interior of the country. Though the fleet of D'Estaing carried a heavier equipment of cannon than did that of Admiral Howe, the French commander did not choose to risk an attack on New York, but passed eastward to Newport. Howe followed him, while Washington and his generals planned active co-operation with the new allies by land. But a sudden storm so dispersed and injured the fleets that the French admiral retired to Boston for repairs and later sailed for the West Indies.

State Constitutions.

69. While the war and foreign relations were thus developing, the states were organizing their governments and Congress was beginning to consider articles of confederation between the states. In this way an effort was made to gather up and make permanent the positive results of the revolution. As under the chartered and royal governments of the colonial period the source of political authority had been the Crown, now by a necessary reaction this was sought in the people. This principle had been stated in the Declaration of Independence, and had been implied throughout the earlier controversy and in much of the history of the colonies as well. The colonies had insisted on a more precise definition of the powers of government; they had opposed parliament because its powers were undefined and therefore dangerous. Following these ideas, the states now described their institutions of government and defined their powers by means of written constitutions. These were formulated by the provincial congresses—which had now become the legislatures—or, as they came to insist upon a more specific expression of the popular will, by conventions chosen for the purpose by the electors. Connecticut and Rhode Island retained their colonial charters. In the earlier days of hasty and temporary devices, the constitutions, like statutes, had been promulgated by the legislatures which formed them and had been put into force by their authority alone. But as time passed and more permanent arrangements became necessary an express popular approval of the instruments was insisted upon and was obtained before they were put into force. The establishment of state governments in this way began before the issue of the Declaration of Independence. It was actively continued during 1776 and the early months of the following year, by which time all of the states had secured at least a temporary constitution. South Carolina and New Hampshire revised theirs before the close of the war. Massachusetts did not secure a constitution which suited her until 1780, but then her procedure corresponded in all particulars with what was to be later American practice in such matters. Of the constitutions of the revolutionary period the two most striking features were the bills of rights and the provisions which were made concerning the executives and their relations to the legislatures. The men of that generation were jealous of government. They insisted upon individual rights, not as acquired and guaranteed by the state, but as original, natural and inhering in time prior to all governments. Governments were instituted for the common benefit, protection and security. Officials were trustees and were accountable to the people. There should be no hereditary title to office or power. There should be no titles of nobility, and in Virginia the system of entails was swept away. Monopolies were declared to be inconsistent with the spirit of a free state. The doctrine that it was unlawful to resist

arbitrary power was declared to be absurd. Freedom of the press and of conscience was asserted, and no obstacles to fair and speedy jury trials were to be tolerated. Elections should be free and frequent, and a preference was expressed for short terms of office. The legislature was universally regarded as the most important department of government. Although the principle of the separation of powers was recognized, in eight states provision was made that the executives should be elected by the legislatures, eleven withheld from them the veto, and the states generally provided for a council to advise them. So manifold and important, however, were the restrictions on suffrage that the states were as yet far from being democracies. On the other hand, many wild and impractical ideas were cherished, and there were anarchic tendencies, which were revealed soon after the war and still later, under the influence of the French Revolution.

The Articles of Confederation.

70. The first draft of the Articles of Confederation between the states was prepared by John Dickinson in the early summer of 1776 and was reported. The report was debated for some weeks after the issue of the Declaration of Independence. Owing to the pressure of war it was then laid aside until the autumn of 1777. By that time the feeling in favour of state sovereignty had so increased that the impossibility of securing assent to the articles in any form had begun to be feared. But the document was completed and submitted to the states in November 1777, when all were encouraged by the news of Burgoyne's surrender. The system for which provision was made in this document was a "confederacy," or "firm league of friendship" between the states, for their common defence, security and general welfare. The Congress was to be continued, and was to consist of delegates annually appointed by the legislature of each state and paid by their states. No attempt was made to create an executive for the confederacy, though authority was given to Congress to appoint a council of state which should manage general affairs, especially during recesses of Congress. To Congress various general powers were entrusted, as deciding on peace and war and superintending the conduct of the same, building a navy, controlling diplomatic relations, coining money and emitting bills of credit, establishing post offices, regulating Indian trade, adjusting boundary disputes between the states. The financial powers entrusted to Congress included those of borrowing money and determining necessary expenditures, but not the power to tax. For supplies the general government had to depend on requisitions from the states. The same system also had to suffice for the raising and equipment of troops. Congress could not make its laws or orders effective in any matter of importance. This was simply a continuation of the policy under which the revolution was being conducted. The Americans had thought that the military and financial concerns of the British Empire could be managed under a system of requisitions, and now they were bent upon trying it in their own imperial relations. The control of trade was also practically left with the states, the Americans in this matter failing to live up to the requirements of the British system. The predominance of the states was further ensured by the provision that no votes, except those for daily adjournment, could be carried without the assent of a majority of all the states, and no important measure without the consent of nine states. But a common citizenship was declared to exist, and Congress received authority to establish a court of appeal which might pass finally on all disputes between states. Taken as a whole, the Articles of Confederation would bear favourable comparison with other schemes of their kind, and they fairly represented the stage of development to which the American states had then attained. The defects which existed in them were reflections of the immaturity, political and social, which had always been apparent in the Americans as colonists and which was to characterize them as a nation for generations to come.

The West.

71. We have seen that, on the whole, the attitude of Great Britain, after the peace of 1763, was not favourable to the colonization of the Mississippi Valley. To the colonists the Quebec Act gained in offensiveness by seeming to imply that it was intended to exclude them from the West. But all such plans were swept away by the outbreak of the War of Independence. Already, before the beginning of hostilities, emigrants had begun to flock across the mountains. Plans were on foot for the establishment of a number of commonwealths, or proprietary provinces, as the case might be. Vandalia was planned in western Virginia, Watauga in western North Carolina. Daniel Boone and his associates pushed farther west into the Kentucky region, and there it was proposed to establish the commonwealth of Transylvania. Other similar projects were started, all repeating in one form or another the political methods which were used when the seaboard colonies were first settled. The backwoodsmen who managed these enterprises were extreme individualists, believed in the propriety of resistance to governments, and were in full sympathy with the War of Independence. They desired to escape to the free land and life of the West and be rid of the quit-rents and other badges of dependence which still lingered in the East. The states which had claims in the West opposed the founding of independent settlements there and, if possible, induced the settlers to be content with the status of counties within some one of the eastern states. After the beginning of the War of Independence, the British from Detroit incited Indian raids for the purpose of destroying or driving out the settlers, especially in Kentucky. These provoked the expeditions of George Rogers Clark (*q.v.*), in 1778 and 1779. With a force of Virginians he seized Kaskaskia and later, after a long march, captured Vincennes and compelled General Henry Hamilton, who had come with a relief force from Detroit, to surrender. This secured to the Americans a permanent hold upon the North-West. But Spain, after she entered upon the war, was determined, if possible, to wrest the valley of the Mississippi from the British and to keep all, or the larger part of it, for herself. To that end, operating from New Orleans, her troops took possession of Natchez, and other posts on the lower Mississippi, and occupied Mobile and Pensacola. These events prevented the possibility of the expulsion of the Americans from the West, but devolved upon their representatives at Paris the necessity of engaging in a diplomatic contest against Spain for the purpose of securing the Mississippi as the western boundary of the United States. But meanwhile the occupation of the West by Americans had a notable influence upon the ratification of the Articles of Confederation.

Articles of Confederation Ratified.

72. Within the Confederacy a fundamental line of cleavage was that between the large and small states. It was jealousy on the part of the latter, their fear lest they might be absorbed by their larger neighbours, which had necessitated the adoption of the plan that in the Congress the delegates should vote by states. When the articles were referred to the states for ratification, the difficulty reappeared. Massachusetts, Connecticut and New York, with Virginia and the three states to the south of it, had large claims to territory between the Appalachians and the Mississippi. New Hampshire, Rhode Island, New Jersey, Delaware and Maryland, which were without hope of westward extension, hesitated to enter the Confederacy, if the large states were to be still further increased by additions to their areas of vast stretches of western country. They insisted that before ratification the states which had claims to western lands should surrender these for the common benefit of the United States. Maryland insisted upon this until, in the end, the cause of state equality and of nationality triumphed. Congress declared that the ceded lands should be formed into states, which should become members of the union with the same rights as other states. When, in 1781, this course of action had become possible, Maryland ratified the articles and they came into effect. The possibility of the expansion of the United States through the development of territories was thus ensured.

73. So far as the North American continent was concerned, the character of the last stage of the struggle with Great Britain

was determined by the fact that the British resolved to transfer the main seat of war to the Southern states, in the hope that Georgia and South Carolina might be detached from the Union. At the close of 1778 Savannah was captured. In September 1779 D'Estaing returned and assaulted Savannah, but, failing to capture it, sailed for France. In 1780 Clinton sailed from New York, besieged Charleston with a force much superior to that of Lincoln, and captured it (May 12). State government in South Carolina ceased. But the chance of detaching those states from the Union and of bringing the war in that region to an end was finally lost by the British. This was chiefly due to an order which recalled the paroles of many of those who had surrendered at Charleston and required that they should perform military service under the British. The attempt to enforce this order, with the barbarities of Colonel Banastre Tarleton and certain Tory bands, provoked a bloody partisan conflict in the upper districts, especially of South Carolina, which contributed more than any other cause to turn the scale against the British in the remote South. By the winter of 1781 they were forced back to Charleston and Savannah. (See AMERICAN WAR OF INDEPENDENCE.)

The War in the South.

74. During the summer of 1780 Washington was prevented from accomplishing anything in the North by the demoralized condition of the finances and by the decline of public spirit. It was very difficult to secure recruits or supplies. The pay of the troops had fallen so into arrears that some of them had already begun mutiny. A second French squadron and military force, under De Ternay and Rochambeau, landed at Newport, but they were at once shut up there by the British. Clinton and Cornwallis were now planning that the latter, having put down resistance in the remote South, should march through North Carolina and Virginia to Baltimore and Philadelphia and that a junction of the two British forces should be effected which, it was believed, would complete the ruin of the American cause. This, too, was the period of Arnold's treason and the death of André. But the turn of the tide in favour of the Americans began with the partisan warfare in South Carolina, which delayed the northward march of Cornwallis, who retired to Wilmington and thence marched north with a small force into Virginia, and in July retired to Yorktown, in the peninsula of Virginia. Washington and Rochambeau had meantime been planning a joint move against the British at New York, or possibly in Virginia, and a letter was sent to De Grasse, the French admiral in the West Indies, suggesting his co-operation. De Grasse replied that he would sail for the Chesapeake. This confirmed Washington and Rochambeau in the opinion that they should march at once for Virginia and, after junction with the force of Lafayette, co-operate with De Grasse against Cornwallis. By well-timed movements the forces were brought together before Yorktown (*q.v.*), and Cornwallis was forced to surrender on the 19th of October 1781.

Yorktown.

75. As the effect of this event was to drive Lord North from power in England, it proved to be the last important operation of the war in America. The king was compelled to give way. Rockingham was called into office at the head of a cabinet which considered the recognition of American independence to be indispensable. The negotiations fell into the hands of Shelburne, the friend of Franklin and disciple of Adam Smith. Richard Oswald was the leading British agent, while Franklin, Jay, John Adams and Henry Laurens were the American negotiators. From the first the acknowledgment of independence, the settlement of the boundaries and the freedom of fishing were insisted on as necessary terms by the Americans. Free commercial intercourse and the cession of Canada to the United States, partly in payment of war claims and partly to create a fund for the compensation of loyalists, were also put forward as advisable conditions of peace. The first three points were early conceded by the British. They also agreed to restrict Canada to its ancient limits. But discussions later arose over the right to dry fish on the British coasts, over the payment of debts due to British subjects prior to the war, and over the compensation of the loyalists. Adams vigorously insisted upon the right to dry and cure fish on British coasts, and finally this concession was secured. Franklin was opposed to the demands of the loyalists, and they had to be content with a futile recommendation by Congress to the states that their claims should be adjusted. It was also agreed that creditors on either side should meet with no lawful impediment to the collection of their debts. Both France and Spain considered the claims of the Americans to be excessive, and were not inclined to yield to them. But the Americans negotiated directly with the British, and the articles were signed without consultation with the French government. This course was offensive to Vergennes, but it was insisted upon as necessary, especially by Jay and Adams, while the diplomatic skill of Franklin prevented a breach with France. Peace was formally ratified on the 3rd of September 1783.

Treaty of Peace.

76. The American army was now disbanded. Since the close of active military operations both officers and men had been striving to secure their pay, which was hopelessly in arrears. Congress had voted half-pay to the officers for life, and many had agreed to accept a commutation of this in the form of full pay for a certain number of years. Certificates for these amounts were issued. But in this, as in other cases, it was found impossible to procure the money for the purpose from the states. Parts of the army repeatedly mutinied, and it was only the influence of Washington which prevented a general outbreak against Congress and the civil government. When the disbandment was finally effected the officers found their certificates depreciated in value and the states indisposed to honour them. They consequently received only a small part of their due, and the privates scarcely anything. This deplorable result was due in part to poverty, but quite as much to bad faith. The country was left in a most demoralized condition, the result of the long war and the general collapse of public and private credit which had accompanied it. It should not be forgotten that the conflict had taken to a considerable extent the form of a civil war. In many of the states Loyalists and Whigs had been arrayed against one another, and had been more or less fully incorporated with the two contending armies. In general the Loyalists showed less capacity for combined action than did their opponents, and in the end they were everywhere defeated. The real tragedy of the conflict will be found, not in the defeat of the British, but in the ruin of the Loyalists. It was accompanied by wholesale confiscations of property in many quarters, and by the permanent exile of tens of thousands of the leading citizens of the republic. These were the *émigrés* of the War of American Independence, and their removal deeply affected property relations and the tone and structure of society in general. Many of those who had been social and political leaders were thus removed, or, if they remained, their influence was destroyed (see LOYALISTS). New men and new families rose in their places, but of a different and in some ways of an inferior type. By this process sympathizers with the War of Independence gained and kept the ascendancy. British and monarchical influences were weakened, and in the end the permanence of republican institutions was ensured. But, as had been foreseen, society in this period of transition exhibited so many repulsive features as almost to cause the stoutest hearts to despair.

BIBLIOGRAPHY.—*Sources*: The records in which are contained the materials for the internal history of any one of the British colonies are the land papers, the minutes of the executive council, the journals of the upper and lower houses of the legislature, the laws and the correspondence and miscellaneous papers which originated from the intercourse between the colonial authorities—especially the governor—and the home government or other colonies and states. Every one of the original states has published these records in part, in series which are known under the general names of colonial records or archives or documents, or provincial papers. The first seven volumes of the *Provincial Papers of New Hampshire* (Concord) contain general records, while other volumes are filled with local and miscellaneous records. Massachusetts has published *Records of the Colony of New Plymouth* (12 vols., Boston, 1885–1887), the *Records of the Governor and Company of Massachusetts Bay in New England, 1628–1686* (5 vols., Boston, 1853–1854), the *Records of the Court of Assistants* (1 vol.), and its laws for the entire

colonial period. Connecticut has printed *The Colonial Records of Connecticut* (15 vols., Hartford, 1850–1890), and the *Records of the Colony of New Haven, 1638–1665* (2 vols., Hartford, 1857–1858). *The Records of the Colony of Rhode Island* fill 10 vols. (Providence, 1856–1865). New York has published the *Laws and Ordinances of New Netherland* (1 vol.), the *Colonial Laws of New York from 1664 to the Revolution* (5 vols., Albany, 1894), *The Journal of the Legislative Council, 1691–1775* (2 vols., 1861), the *Journal of the Votes and Proceedings of the General Assembly, 1691–1765* (2 vols., 1764–1766), the *Documents relating to the Colonial History of New York* (15 vols., 1853–1883), *Minutes of the Albany Commissioners for Detecting Conspiracies* (3 vols., 1909–1910) and the *Documentary History of the State of New York* (4 vols., 1849–1851). New Jersey has published the *Grants and Concessions* (1 vol.), edited by Leaming and Spier, and 28 vols. of *The Archives of the State of New Jersey* (Newark, 1880 sqq.). Pennsylvania has published 16 vols. of *Colonial Records, 1683–1790* (Philadelphia, 1852) and four series of *Pennsylvania Archives* (1852–1856, 1874–1893, 1894–1895, &c.), the latter containing miscellaneous records relating to the colonies and the War of Independence. Under the title of *Statutes at Large* (11 vols.) its laws to the close of the War of Independence have been published. *The Archives of Maryland* (27 vols., Baltimore) contain the proceedings of the council, the assembly and the provincial court, with the laws, for a part of the colonial period. The *Records of the Virginia Company of London* (2 vols., Washington, 1906) have been printed; also Henning's *Statutes at Large* (13 vols., 1819–1823), and the *Journal of the House of Burgesses* for the later provincial period. Under the titles of *Colonial Records* (1886–) and *State Records*, North Carolina has published the sources of her early history very fully, except the land papers and laws. Thomas Cooper's *Statutes of South Carolina* (4 vols., to 1782) contain practically all of its sources which that state has published. Georgia has published 12 vols. of *Colonial Records*, containing minutes of the trustees and of the governor and council. The *Calendar of State Papers, Colonial Series, 1574–1660* (London, 1860), and for 1661–1700 (13 vols., London, 1880–1910), the *Acts of the Privy Council Colonial, 1613–1720* (2 vols., London, 1908–1910), and the *Calendars of Treasury Papers* (for the 18th century) cover relations between the British government and the colonies. Additional matter may also be found in many of the reports of the British Historical MSS. Commission. Hazard's *Historical Collections* (2 vols., Philadelphia, 1792–1794) is still valuable. B. Perley Poore's *Federal and State Constitutions* (2 vols., Washington, 1877) contains the texts of the colonial charters and state constitutions; and a similar collection was edited by F. N. Thorpe (7 vols., ibid., 1909). The records of many New England towns have been printed, as also those of New York City, Philadelphia and Albany. *The Original Narratives of Early American History* (1906–1910), edited by J. F. Jameson, contain reprints of much source material.

Cobbett's *Parliamentary History*, Almon's *Remembrancer* (17 vols., London, 1775–1784), and the writings of the British statesmen of the period, contain much material which is indispensable to the history of the War of Independence on its British side. Of official matters relating to the period of the War of Independence, special reference should be made to the *Public Journals of the Continental Congress* (13 vols.), and the *Secret Journals* (4 vols.). A new and improved edition (1908 sqq.) has been edited by W. C. Ford and G. Hunt. Indispensable to the student is Peter Force's *American Archives* (9 vols., Washington, 1837–1853), covering the years 1774 to 1776 inclusive. Francis Wharton's *Revolutionary Diplomatic Correspondence of the United States* (6 vols., Washington, 1889), and the earlier and less complete edition of the same by Jared Sparks (12 vols., Boston, 1829–1830), are also of great value. Alden Bradford's *Massachusetts State Papers* is valuable for that province. The journals of committees of safety, provincial congresses, conventions and early state legislatures are also for the most part in print. The colonial and revolutionary newspapers contain material of great variety. Semi-official also are the writings of the statesmen of the War of Independence—John and Samuel Adams, Jefferson, Dickinson, Franklin, Washington, Jay, all of which exist in very satisfactory editions. Henri Doniol's *Histoire de la participation de la France à l'établissement des États-Unis d'Amérique* (5 vols., Paris, 1886–1900) is a diplomatic history of the War of Independence and the peace, dealing chiefly with France.

The states all have historical societies, and there are many private and local societies in addition. Of these the most prominent are the societies of Massachusetts, New York, Pennsylvania, Maryland and Virginia. In addition, mention should be made of the Prince Society of Boston, the American Antiquarian Society of Worcester, Mass., the Essex Institute of Salem, Mass., the Narragansett Club of Providence, R.I., and the Colonial Society of Massachusetts. The American Historical Association (Washington, D.C.) publishes valuable monographs; the second volume of the Report of the Association for 1905 is a detailed *Bibliography of American Historical Societies* (Washington, 1907).

Standard Histories: Of these the histories of the states first demand attention. Jeremy Belknap's *History of New Hampshire* (3 vols., 1784–1792; enlarged, 3 vols., Boston, 1813); Thomas Hutchinson's *History of the Province of Massachusetts Bay* (3 vols., Boston, 1767, and vol. iii., London, 1828); Samuel Greene Arnold's *History of the State of Rhode Island and Providence Plantations, 1636–1790* (2 vols., New York, 1859–1860); Benjamin Trumbull's *Complete History of Connecticut, Civil and Ecclesiastical, to 1764* (New Haven, 1818; revised, 2 vols., New London, 1898); John Romeyn Brodhead's *History of the State of New York* (2 vols., New York, 1853–1871); William Smith's *History of the Late Province of New York, from its Discovery to 1762* (2 vols., New York, 1829–1830); Samuel Smith's *History of the Colony of Nova Cæsaria, or New Jersey, to 1721* (Burlington, N.J., 1765; 2nd ed., Trenton, 1877); Robert Proud's *History of Pennsylvania from 1681 till after the year 1742* (2 vols., Philadelphia, 1797–1798); John Leeds Bozman's *History of Maryland, 1633–1660* (2 vols., Baltimore, 1837); John V. L. McMahon's *A Historical View of the Government of Maryland from its Colonization to the Present Day* (Baltimore, 1833); William Stith's *History of the First Discovery and Settlement of Virginia* (Williamsburg, 1747); John Daly Burk's *History of Virginia* (3 vols., Petersburg, 1804–1805); François Xavier Martin's *History of North Carolina* (2 vols., New Orleans, 1829); William James Rivers's *Sketch of the History of South Carolina to the Close of the Proprietary Government by the Revolution of 1719* (Charleston, 1856); Edward McCrady's *South Carolina* (4 vols., New York, 1897–1902)—covering the period from 1670 to 1783—and Charles Colcock Jones's (jun.) *History of Georgia* (2 vols., Boston, 1883) are especially noteworthy. William Bradford's *History of Plimouth Plantation* (latest edition, Boston, 1898), and John Winthrop's *History of New England, 1630–1649* (2 vols., Boston, 1825–1826), are essentially original sources, as are the *Writings of Captain John Smith* (Arber's ed.) for early Virginia. So are Alexander Brown's *Genesis of the United States* (2 vols., Boston, 1890), and the *First Republic in America* (Boston, 1898). Philip Alexander Bruce's *Economic History of Virginia in the Seventeenth Century* (2 vols., New York, 1896) and W. B. Weeden's *Economic and Social History of New England* (2 vols., Boston, 1890) are of great value. Edmund B. O'Callaghan's *History of New Netherland* (2 vols., New York, 1846–1848), John Gorham Palfrey's *History of New England* (5 vols., Boston, 1858–1890) and I. B. Richman's *Rhode Island, its Making and its Meaning* (New York, 1902), are valuable for colonial New York, New England and Rhode Island respectively. George Bancroft's *History of the United States* (6 vols., 1884–1885) still has a great reputation, though it is altogether inadequate for the colonial period. Richard Hildreth's *History of the United States* (6 vols., New York, 1849–1852) is dry but accurate. John Andrew Doyle's *English in America* (5 vols., New York, 1882–1907) is valuable for the 17th century. Herbert L. Osgood's *American Colonies in the Seventeenth Century* (3 vols., New York, 1904–1907) discusses the institutional history of the period. John Fiske has popularized the history of the times in a number of excellent works, some of them of decided originality. Francis Parkman's *France and England in North America* (12 vols., latest ed., Boston, 1898) is a classic on the history of Canada and its relations with the British colonies. William Kingsford's *History of Canada* (10 vols., Toronto, 1887–1898), and François Xavier Garneau's *Histoire du Canada* (4 vols., Quebec, 1845–1852), may be cited as holding places of special authority. Justin Winsor's *Christopher Columbus* (Boston, 1891), *Cartier to Frontenac* (ibid., 1894), and later volumes, are especially valuable for the history of exploration, discovery and cartography. *The American Nation* (22 vols., New York, 1903–1907), a co-operative history, edited by A. B. Hart, outlines the political history of the country as a whole. Edward Channing's *History of the United States* (8 vols., New York, 1905 sqq.), and Elroy McKendree Avery's *History of the United States and Its People* (15 vols., Cleveland, Ohio, 1905 sqq.) devote much space to the colonies and War of Independence. Sir George Otto Trevelyan's *American Revolution* (3 vols., London, 1899–1904) is a brilliant literary performance. Of special value is Lecky's study of the same subject in his *History of England in the Eighteenth Century* (8 vols., London, 1878–1890). George Louis Beer's *Origins of the British Colonial System* (New York, 1908) and his *British Colonial Policy, 1754–1765* (New York, 1907), Justin Harvey Smith's *Our Struggle for the Fourteenth Colony* (2 vols., New York, 1907) and S. G. Fisher's *Struggle for American Independence* (2 vols., Philadelphia, 1908) are valuable monographs. For biography see the "American Statesmen Series" (16 vols., Boston) and Samuel V. Wells's *Life and Public Services of Samuel Adams* (3 vols., Boston, 1865); James Kendall Hosmer's *Life of Thomas Hutchinson* (Boston, 1896); William Garrott Brown's *Life of Oliver Ellsworth* (New York, 1905); B. J. Lossing's *Life and Times of Philip Schuyler* (2 vols., New York, 1860–1873) and Bayard Tuckerman's *Philip Schuyler, Major-General in the American Revolution* (New York, 1903); George Washington Greene's *Life of Nathanael Greene* (3 vols., Boston, 1867–1871) and William Johnson's *Sketches of the Life and Correspondence of Nathanael Greene* (Charleston, 1822); William Thompson Reed's *Life and Correspondence of George Reed* (Philadelphia, 1870); Charles Janeway Stillé's *Life and Times of John Dickinson* (Philadelphia, 1891); William Wirt Henry's *Patrick Henry* (3 vols., New York, 1891); John Marshall's *Life of George Washington* (5 vols., Philadelphia, 1804–1807); C. Tower's *The Marquis de La Fayette in the American Revolution* (2 vols., ibid., 1895); F. Kapp's *Life of Frederick William von Steuben* (New York, 1859), and his *Life of John Kalb* (New York, 1884). Moses Coit Tyler's *Literary History of the American Revolution* (2 vols., New York,

1897) is of unique interest. Lorenzo Sabine's *Biographical Sketches of Loyalists of the American Revolution* (2 vols., Boston, 1864), and Claude Halstead Van Tyne's *The Loyalists in the American Revolution* (New York, 1902); Herbert Friedenwald's *The Declaration of Independence* (New York, 1904), and John Hampden Hazelton's the *Declaration of Independence—Its History* (New York, 1906), are valuable special studies. Many important monographs have appeared in the "Johns Hopkins University Studies," "the Columbia University Studies," the "Harvard Historical Studies," and among the publications of the universities of Wisconsin and Pennsylvania. The Carnegie Institution has issued the first volume of a report, edited by C. M. Andrews and F. G. Davenport, on materials in British archives for the period before 1783. The bibliography of American history receives adequate treatment in Justin Winsor's *Narrative and Critical History of America* (8 vols., Boston, 1886–1889) and in J. N. Larned's *Literature of American History* (Boston, 1902). (H. L. O.)

F.—*The Struggle for National Government, 1783–1789.*

77. The long struggle to secure the ratification of the Articles of Confederation had given time for careful consideration of the new scheme of government. Maryland's persistent criticism had prepared men to find defects in them. Conventions of New England states, pamphlets, and private correspondence had found flaws in the new plan; but a public trial of it was a necessary preliminary to getting rid of it. The efforts of the individual states to maintain the war, the disposition of each state to magnify its own share in the result, the popular jealousy of a superior power, transferred now from parliament to the central government, were enough to ensure the articles some lease of life. A real national government had to be extorted through the "grinding necessities of a reluctant people."

78. Congress and its committees had already begun to declare that it was impossible to carry on a government efficiently under the articles. Its expostulations were to be continued for several years before they were heard. In the meantime it did not neglect the great subject which concerned the essence of nationality—the western territory. Virginia had made a first offer to cede her claims, but it was not accepted. A committee of Congress now made a report (1782) maintaining the validity of the rights which New York had transferred to Congress; and in the next year Virginia made an acceptable offer. Her deed was accepted (March 1, 1784); the other claimant states followed; and Congress, which was not authorized by the articles to hold or govern territory, became the sovereign of a tract of some 430,000 sq. m., covering all the country between the Atlantic tier of states and the Mississippi river, from the British possessions nearly to the Gulf of Mexico.

Territorial Cessions.

79. In this territory Congress had now on its hands the same question of colonial government in which the British parliament had so signally failed. The manner in which Congress dealt with it has made the United States the country that it is. The leading feature of its plan was the erection, as rapidly as possible, of states, similar in powers to the original states. The power of Congress over the Territories was to be theoretically absolute, but it was to be exerted in encouraging the development of thorough self-government, and in granting it as fast as the settlers should become capable of exercising it. Copied in succeeding acts for the organization of Territories, and still controlling the spirit of such acts, the Ordinance of 1787 (July 13, 1787) is the foundation of almost everything which makes the modern American system peculiar.

Territorial Government.

The Ordinance of 1787.

80. The preliminary plan of Congress was reported by a committee of which Thomas Jefferson (*q.v.*) was chairman, and was adopted by Congress on the 23rd of April 1784. It provided for the erection of seventeen states, north and south of the Ohio, with some odd names, such as Sylvania, Assenisipia, Metropotamia, Polypotamia and Pelisipia. These states were for ever to be a part of the United States, and to have republican governments. The provision, "After the year 1800 there shall be neither slavery nor involuntary servitude in any of the said states, other than in the punishment of crimes whereof the party shall have been duly convicted," represented Jefferson's feeling on this subject, but was lost for want of seven states in its favour.

81. The final plan of 1787 was reported by a committee of which Nathan Dane, of Massachusetts, was chairman. The prohibition of slavery was made perpetual, and a fugitive slave clause was added. The ordinance covered only the territory north of the Ohio, and provided for not less than three nor more than five states. Ohio, Indiana, Illinois, Michigan and Wisconsin have been the resultant states. At first Congress was to appoint the governor, secretary, judges and militia generals, and the governor and judges were, until the organization of a legislature, to make laws subject to the veto of Congress. When the population reached 5000 free male adult inhabitants the Territory was to have an assembly of its own, to consist of the governor, a legislative council of five, selected by Congress from ten nominations by the lower house, and a lower House of Representatives of one delegate for every 500 free male inhabitants.[1] This assembly was to choose a delegate to sit, but not to vote, in Congress, and was to make laws not repugnant to "the principles and articles" established and declared in the ordinance. These were as follows: the new states or Territories were to maintain freedom of worship, the benefits of the writ of *habeas corpus*, trial by jury, proportionate representation, bail, moderate fines and punishments, and the preservation of liberty, property and private contracts; they were to encourage education and keep faith with the Indians; they were to remain for ever a part of the United States; and they were not to interfere with the disposal of the soil by the United States, or to tax the lands of the United States, or to tax any citizen of the United States for the use of the navigable waters leading into the Mississippi or St Lawrence rivers. These articles were to be unalterable unless by mutual consent of a state and the United States. The transformation of the Territory, with its limited government, into a state, with all the powers of an original state, was promised by Congress as soon as the population should reach 60,000 free inhabitants, or, under certain conditions, before that time.

82. The Constitution, which was adopted almost immediately afterwards, provided merely (art. iv, § 3) that "Congress shall have power to dispose of, and make all needful rules and regulations respecting, the territory or other property belonging to the United States," and that "new states may be admitted by the Congress into this Union." Opinions have varied as to the force of the Ordinance of 1787. The Southern school of writers have been inclined to consider it *ultra vires* and void; and they adduce the fact that the new Congress under the Constitution thought it necessary to re-enact the ordinance (Aug. 7, 1789). The opposite school have inclined to hold the ordinance as still in force. Even as to the Territorial provision of the Constitution, opinions have varied.

83. In the interval of the settlement of the territorial question the affairs of the "league of friendship," known as the United States, had been going from bad to worse, culminating in 1786. The public debt amounted in 1783 to about $42,000,000, of which $8,000,000 was owed abroad—in Holland, France and Spain. Congress had no power to levy taxes for the payment of interest or principal; it could only make requisitions on the states. In the four years ending in 1786 requisitions had been made for $10,000,000 and the receipts from them had amounted to but one-fourth of what had been called for. Even the interest on the debt was falling into arrears, and the first instalment of the principal fell due in 1787. To pay this, and subsequent annual instalments of $1,000,000, was quite impossible. Robert Morris, the financier of the War of Independence, resigned in 1783 rather than "be the minister of injustice," hoping thus to force upon the states the necessity of granting taxing powers to Congress. Washington, on retiring from the command-in-chief, wrote a circular letter to the governors of all the states, urging the necessity of granting to Congress some power to provide a national revenue. Congress (April 18, 1783) appealed to the states for power to levy specific duties on certain enumerated articles, and 5% on others. It was believed that with these duties and the requisitions, which were now to be met by internal taxation, $2,500,000 per annum could be raised. Some of the states ratified the proposal; others ratified it with modifications; others rejected it, or changed their votes; and it never received the necessary ratification of all the states. The obedience to the requisitions grew more lax. In 1786 a committee of Congress reported that any further reliance on requisitions would be "dishonourable to the understandings of those who entertain such confidence."

Difficulties of the Confederation.

[1] When the total number should reach 25, the legislature itself was to have the power of regulating the number and proportion. Property qualifications were prescribed for electors, representatives and members of the council.

84. In the states the case was even worse. Some of them had been seduced into issuing paper currency in such profusion that they were almost bankrupt. Great Britain, in the treaty of peace, had recognized the independence of the individual states, naming them in order; and her government followed the same system in all its intercourse with its late colonies. Its restrictive system was maintained, and the states, vying with each other for commerce, could adopt no system of counteracting measures. Every possible burden was thus shifted to American commerce; and Congress could do nothing, for, though it asked for the power to regulate commerce for fifteen years, the states refused it. The decisions of the various state courts began to conflict, and there was no power to reconcile them or to prevent the consequences of the divergence. Several states, towards the end of this period, began to prepare or adopt systems of protection of domestic productions or manufactures, aimed at preventing competition by neighbouring states. The Tennessee settlers were in insurrection against the authority of North Carolina; and the Kentucky settlers were disposed to cut loose from Virginia. Poverty, with the rigid execution of process for debt, drove the farmers of western Massachusetts into an insurrection (Shays's Insurrection) which the state had much difficulty in suppressing; and Congress was so incompetent to aid Massachusetts that it was driven to the expedient of imagining an Indian war in that direction, in order to transfer troops thither. Congress itself was in danger of disappearance from the scene. The necessity for the votes of nine of the thirteen states for the passage of important measures made the absence of a state's delegation quite as effective as a negative vote. Congress even had to make repeated appeals to obtain a quorum for the ratification of the treaty of peace with Great Britain. In 1784 Congress actually broke up in disgust, and the French minister reported to his government—"There is now in America no general government—neither Congress, nor president, nor head of any one administrative department." Everywhere there were symptoms of a dissolution of the Union.

Of the States.

Of Congress.

85. Congress was evidently incompetent to frame a new plan of national government; its members were too dependent on their states, and would be recalled if they took part in framing anything stronger than the articles. The idea of a convention of the states, independent of Congress, was in the minds and mouths of many; Thomas Paine had suggested it as long ago as his *Common Sense* pamphlet: "Let a continental conference be held . . . to frame a continental charter . . . fixing the number and manner of choosing members of Congress, members of assembly . . . drawing the line of business and jurisdiction between them." To a people as fond of law and the forms of law as the Americans there was a difficulty in the way. The articles had provided that no change should be made in them but by the assent of every state legislature. If the work of such a convention was to be subject to this rule, its success would be no greater than that of Congress; if its plan was to be put into force on the ratification of less than the whole number of states, the step would be more or less revolutionary. In the end the latter course was taken, though not until every other expedient had failed; but the act of taking it showed the underlying consciousness that union, independence and nationality were now inextricably complicated, and that the thirteen had become one in some senses.

Proposals for a Convention.

86. The country drifted into a convention by a roundabout way. The navigation of Chesapeake Bay and the Potomac needed regulation; and the states of Maryland and Virginia, having plenary power in the matter, appointed delegates to arrange such rules. The delegates met (1785) at Alexandria, Va. (*q.v.*), and at Washington's house, Mount Vernon. Maryland, in adopting their report, proposed that Pennsylvania and Delaware be asked to nominate commissioners, and Virginia went further and proposed a meeting of commissioners from all the states to frame commercial regulations for the whole. The convention met (1786) at Annapolis (*q.v.*), Maryland, but only five states were represented, and their delegates adjourned, after recommending another convention at Philadelphia in May 1787.

Convention of 1786.

87. Congress had failed in its last resort—a proposal that the states should grant it the impost power alone; New York's veto had put an end to this last hope. Confessing its helplessness, Congress approved the call for a second convention; twelve of the states (all but Rhode Island) chose delegates; and the convention met at Philadelphia (May 25, 1787), with an abler body of men than had been seen in Congress since the first two Continental Congresses. Among others, Virginia sent Washington, James Madison, Edmund Randolph, George Mason and George Wythe; Pennsylvania: Franklin, Robert and Gouverneur Morris and James Wilson; Massachusetts: Rufus King, Elbridge Gerry and Caleb Strong; Connecticut: William S. Johnson, Roger Sherman and Oliver Ellsworth; New York: Alexander Hamilton; New Jersey: William Paterson; and South Carolina the two Pinckneys and John Rutledge. With hardly an exception the fifty-five delegates were clear-headed, moderate men, with positive views of their own and firm purpose, but with a willingness to compromise.

Convention of 1787.

88. Washington was chosen to preside, and the convention began the formation of a new Constitution, instead of proposing changes in the old one. Two parties were formed at once. The Virginia delegates offered a plan (see RANDOLPH, EDMUND), proposing a Congress, of two houses, having power to legislate on national subjects, and to compel the states to fulfil their obligations. This is often spoken of as a "national" plan, but very improperly. It was a "large-state" plan, proposed by those states which had or hoped for a large population. It meant to base representation in both houses on population, so that the large states could control both of them, and it left the appointment of the president or other executive and the Federal judges to Congress—so that the whole administration of the new government would fall under large-state control. On behalf of the "small states" Paterson of New Jersey brought in another plan.[1] It continued the old Confederation, with its single house and equal state vote, but added the power to regulate commerce and raise a revenue, and to compel the states to obey requisitions. The large states had a general majority of six to five, but the constant dropping off of one or more votes, on minor features, from their side to that of the small states prevented the hasty adoption of any radical measures. Nevertheless, the final collision could not be evaded; the basis of the two plans was in the question of one or two houses, of equal or proportionate state votes, of large-state supremacy or of state equality. In July the large states began to show a disposition to force their plan through, and the small states began to threaten a concerted withdrawal from the convention.

The Virginia Plan.

The New Jersey Plan.

89. The Connecticut delegates, from their first appearance in the convention, had favoured a compromise. They had been trained under the New England system, in which the assemblies were made up of two houses, one representing the people of the whole state, according to population, and the other giving an equal representation to the towns. They proposed that the new Congress should be made up of two houses, one representing the states in proportion to their population, the other giving an equal vote to each state. At a deadlock the convention referred the proposition to a committee, and it reported in favour of the Connecticut compromise. Connecticut had been voting in the large-state list, and the votes of her delegates could not be spared from their slender majority; now another of the large states, North Carolina, came over to Connecticut's proposal, and it was adopted. Thus the first great struggle of the convention resulted in a compromise, which took shape in an important feature of the Constitution, the Senate.

The Compromise.

90. The small states were still anxious, in every new question, to throw as much power as possible into the hands of their

[1] A third plan was introduced by Charles Pinckney; for a discussion of this plan see the separate article on PINCKNEY.

special representative, the Senate; and that body thus obtained its power to act as an executive council as a restraint on the president in appointments and treaties.

The Work of the Convention. This was the only survival of the first alignment of parties; but new divisions arose on almost every proposal introduced. The election of the president was given at various times to Congress and to electors chosen by the state legislatures; and the final mode of choice, by electors chosen by the states, was settled only two weeks before the end of the convention, the office of vice-president coming in with it. The opponents and supporters of the slave trade compromised by agreeing not to prohibit it for twenty years. Another compromise included three-fifths of the slaves in enumerating population for representation. This provision gave the slaveholders abnormal power as the number of slaves increased.

91. Any explanation of the system introduced by the Constitution must start with the historical fact that, while the national government was practically suspended, from 1776 until 1789, the only power to which political privileges had been given by the people was the states, and that the state legislatures were, when the convention met, politically omnipotent, with the exception of the few limitations imposed on them by the early state constitutions. The general rule, then, is that the Federal government has only the powers granted to it by the Federal Constitution, while the state has all governmental powers not forbidden to it by the state or the Federal Constitution. But the phrase defining the Federal government's powers is no longer "expressly granted," as in the Articles of Confederation, but merely "granted," so that powers necessary to the execution of granted powers belong to the Federal government, even though not directly named in the Constitution. This question of the interpretation or "construction" of the Constitution is at the bottom of real national politics in the United States: the minimizing parties have sought to hold the Federal government to a strict construction of granted powers, while their opponents have sought to widen those powers by a broad construction of them. The strict-construction parties, when they have come into power, have regularly adopted the practice of their opponents, so that construction has pretty steadily broadened.

92. Popular sovereignty, then, is the basis of the American system. But it does not, as does the British system, choose its legislative body and leave unlimited powers to it.

The Constitution. It makes its "Constitution" the permanent medium of its orders or prohibitions to all branches of the Federal government and to many branches of the state governments: they must do what the Constitution directs and leave undone what it forbids. The people, therefore, are continually laying their commands on their governments; and they have instituted a system of Federal courts to ensure obedience to their commands. A British court must obey the act of parliament; the American court is bound and sworn to obey the Constitution first, and the act of Congress or of the state legislature only so far as it is warranted by the Constitution. But the American court does not deal directly with the act in question; it deals with individuals who have a suit before it. One of these individuals relies on an act of Congress or of a state legislature; the act thus comes before the court for examination; and it supports the act or disregards it as "unconstitutional," or in violation of the Constitution. If the court is one of high rank or reputation, or one to which a decision may be appealed, as the United States Supreme Court, other courts follow the precedent, and the law falls to the ground. The court does not come into direct conflict with the legislative body; and, where a decision would be apt to produce such a conflict, the practice has been for the court to regard the matter as a "political question" and refuse to consider it.

93. The preamble states that "we, the people of the United States," establish and ordain the Constitution. Events have shown that it was the people of the whole United States that established the Constitution, but the people of 1787 seem to have inclined to the belief that it was the people of each state for itself. This belief was never changed in the South; and in 1861 the people of that section believed that the ordinances of secession were merely a repeal of the enacting clause by the power which had passed it, the people of the state. An account of the form of government established by the Constitution appears elsewhere (see UNITED STATES: VII.—*Constitution and Government*, pp. 646 sqq.).

94. The Constitution's leading difference from the Confederation is that it gives the national government power over individuals. The

Its Power over Individuals. Federal courts are the principal agent in securing this essential power; without them, the Constitution might easily have been as dismal a failure as the Confederation. It has also been a most important agent in securing to the national government its supremacy over the states. From this point of view the most important provision of the Constitution is the grant of jurisdiction to Federal courts in cases involving the construction of the Constitution or of laws or treaties made under it. The 25th section of the Judiciary Act of 1789 permitted any Supreme Court justice to grant a writ of error to a state court in a case in which the constitutionality of a Federal law or treaty had been denied, or in which a state law objected to as in violation of the Federal Constitution had been maintained. In such cases, the defeated party had the right to carry the "Federal question" to the Federal courts. It was not until 1816 that the Federal courts undertook to exercise this power; it raised a storm of opposition, but it was maintained, and has made the Constitution what it professed to be—"the supreme law of the land."

Treason. Treason was restricted to the act of levying war against the United States, or of adhering to their enemies, giving them aid and comfort. The states, however, have always asserted their power to punish for treason against them individually. It has never been fully maintained in practice; but the theory had its effect in the secession period.

95. The system of the United States is almost the only national system, in active and successful operation, as to which the exact location of the sovereignty is still a mooted question.

The Sovereignty. The contention of the Calhoun school—that the separate states were sovereign before and after the adoption of the Constitution, that the Union was purely voluntary, and that the whole people, or the people of all the other states, had no right to maintain or enforce the Union against any state—has been ended by the Civil War. But that did not decide the location of the sovereignty. The prevalent opinion is still that first formulated by Madison: that the states were sovereign before 1789; that they then gave up a part of their sovereignty to the Federal government; that the Union and the Constitution were the work of the states, not of the whole people; and that reserved powers are reserved to the people of the states, not to the whole people. The use of the bald phrase "reserved to the people," not to the people of the several states, in the 10th amendment, seems to argue an underlying consciousness, even in 1789, that the whole people of the United States was already a political power quite distinct from the states, or the people of the states; and the tendency of later opinion is in this direction. The restriction to state lines seems to be a self-imposed limitation by the national people, which it might remove, as in 1789, if an emergency should make it necessary.

96. By whatever sovereignty the Constitution was framed and imposed, it was meant only as a scheme in outline, to be filled up afterwards, and from time to time, by legislation.

Details of the System. The idea is most plainly carried out in the Federal judiciary: the Constitution only directs that there shall be a Supreme Court, and marks out the general jurisdiction of all the courts, leaving Congress, under the restriction of the president's veto power, to build up the system of courts which shall best carry out the design of the Constitution. But the same idea is visible in every department, and it has carried the Constitution safely through a century which has radically altered every other civilized government. It has combined elasticity with the limitations necessary to make democratic government successful over a vast territory, having infinitely diverse interests, and needing, more than almost anything else, positive opportunities for sober second thought by the people. A sudden revolution of popular thought or feeling is enough to change the House of Representatives from top to bottom; it must continue for several years before it can make a radical change in the Senate, and for years longer before it can carry this change through the judiciary, which holds for life; and all these changes must take place before the full effects upon the laws or Constitution are accomplished. But minor changes are reached in the meantime easily and naturally in the course of legislation. The members of the Convention of 1787 showed their wisdom most plainly in not trying to do too much; if they had done more they would have done far less.

97. The convention adjourned on the 17th of September 1787, having adopted the Constitution. Its last step was a resolution that the Constitution be sent to the Congress of the

Submission to Congress. Confederation, with the recommendation that it be submitted to conventions elected by the people of each state for ratification or rejection; that, if nine states should ratify it, Congress should appoint days for the popular election of electors, and that then the new Congress and president should, "without delay, proceed to execute this Constitution." Congress resolved that the report of the convention be sent to the several legislatures, to be submitted to conventions; and this was all the approval the Constitution ever received from Congress. Both Congress and the convention were careful not to open the dangerous question, How was a government which was not to be changed but by the legislatures of all the states to be entirely supplanted by a different system through the approval of conventions in three-fourths of them? They left such questions to be opened, if at all, in the less public forum of the legislatures.

98. Before the end of the year Delaware, Pennsylvania and

Federalists and Anti-Federalists.

New Jersey had ratified; and Georgia, Connecticut and Massachusetts followed during the first two months of 1788. Thus far the only strong opposition had been in Massachusetts, a "large state." In it the struggle began between the friends and the opponents of the Constitution, with its introduction of a strong Federal power; and it raged in the conventions, legislatures, newspapers and pamphlets. In a classic series of papers, the *Federalist*, Alexander Hamilton, with the assistance of James Madison and John Jay, explained the new Constitution and defended it. As it was written before the Constitution went into force, it speaks much for the ability of its writers that it has passed into a standard textbook of American constitutional law.

Ratification.

99. The seventh and eighth states—Maryland and South Carolina—ratified in April and May 1788; and, while the conventions of Virginia and New York were still wrangling over the great question, the ninth state, New Hampshire, ratified, and the Constitution passed out of theory into fact. The Anti-Federalists of the Virginia and New York conventions offered conditional ratifications of all sorts; but the Federalists stubbornly refused to consider them, and at last, by very slender majorities, these two states ratified. North Carolina refused to ratify the Constitution, and in Rhode Island it was referred to the several towns instead of to a convention and was rejected by an overwhelming majority, the Federalists, who advocated the calling of a convention, refraining from voting (§112). Congress named the first Wednesday of January 1789 as the day for the choice of electors, the first Wednesday in February for the choice of president and vice-president, and the first Wednesday in March for the inauguration of the new government, at New York City. The last date fell on the 4th of March, which has been the limit of each president's term since that time.

Inauguration.

Fall of the Confederation.

100. When the votes of the electors were counted before Congress, it was found that Washington had been unanimously elected president, and that John Adams, standing next on the list, was vice-president. Long before the inauguration the Congress of the Confederation had expired of mere inanition; its attendance simply ran down until (Oct. 21, 1788) its record ceased, and the United States got on without any national government for nearly six months. The struggle for nationality had been successful, and the old order faded out of existence.

Slavery in the United States.

101. The first census (1790) followed so closely upon the inauguration of the Constitution that the country may fairly be said to have had a population of nearly four millions in 1789. Something over half a million of these were slaves, of African birth or blood. Slavery of this sort had taken root in almost all the colonies, its original establishment being everywhere by custom. When the custom had been sufficiently established statutes came in to regulate a relation already existing. But it is not true, as the Dred Scott decision held long afterwards (§215), that the belief that slaves were chattels simply, things, not persons, held good at the time of the adoption of the Constitution. Times had changed somewhat. The peculiar language of the Constitution itself, describing a slave as a "person held to service or labour," under the laws of any state, puts the general feeling exactly: slaves were persons from whom the laws of some of the states withheld personal rights for the time. In accordance with this feeling most of the Northern states were on the high road towards abolition of slavery. Vermont had never allowed it. In Massachusetts it was swept out by a summary court decision that it was irreconcilable with the new state constitution. Other states soon began systems of gradual abolition, which finally extinguished slavery north of Maryland, but so gradually that there were still 18 apprentices for life in New Jersey in 1860, the last remnants of the former slave system. In the new states north of the Ohio slavery was prohibited by the ordinance of 1787 (§81), and the prohibition was maintained in spite of many attempts to get rid of it and introduce slavery.

Abolition in the North.

Feeling in the South

102. The sentiment of thinking men in the South was exactly the same, or in some cases more bitter from their personal entanglement with the system. Jefferson's language as to slavery is irreconcilable with the chattel notion; no abolitionist agitator ever used warmer language than he as to the evils of slavery; and the expression, "our brethren," used by him of the slaves, is conclusive. Washington, George Mason and other Southern men were almost as warm against slavery as Jefferson, and there were societies for the abolition of slavery in the South. In the Constitutional convention of 1787 the strongest opposition to an extension of the period of non-interference with the slave trade from 1800 to 1808 came from Virginia, whereas every one of the New England states, in which the trade was an important source of profit, voted for this extension. No thinking man could face with equanimity the future problem of holding a separate race of millions in slavery. Like most slave laws, the laws of the Southern states were harsh: rights were almost absolutely withheld from the slave, and punishments of the severest kind were legal; but the execution of the system was milder than its legal possibilities might lead one to imagine. The country was as yet so completely agricultural that Southern slavery kept all the patriarchal features possible to such a system.

Agriculture, Commerce and Manufactures.

103. Indeed, the whole country was almost exclusively agricultural, and, in spite of every effort to encourage manufactures by state bounties, they formed the meagrest element in the national production. Connecticut, which now teems with manufactures, was just beginning the production of tinware and clocks; Rhode Island and Massachusetts were just beginning to work in cotton from models of jennies and Arkwright machinery surreptitiously obtained from England; and other states, beyond local manufactures of paper, glass and iron, were almost entirely agricultural, or were engaged in industries directly dependent on agriculture. Commerce was dependent on agriculture for export and manufactured imports were enough to drown out every other form.

Changes since 1790.

104. There were but five cities in the United States having a population of more than 10,000—New York (33,000), Philadelphia (28,500), Boston (18,000), Charleston (16,000) and Baltimore (13,000). The population of the city of New York is now greater than that of the original thirteen states in 1790; the state of New York has now about twice as many inhabitants as the thirteen had in 1790; and the new states of Ohio and Illinois, which had hardly any white inhabitants in 1789, have each a larger population than the whole thirteen then had. Imports have swollen from $23,000,000 to $1,475,612,580 (1909); exports from $20,000,000 to $1,728,203,271 (1909), since 1790. The revenues of the new government in 1790 were $4,000,000; the expenditures, excluding interest on the public debt, but $1,000,000; now both the revenues and the expenditures are about $1,000,000,000. It is not easy for the modern American to realize the poverty and weakness of his country at the inauguration of the new system of government, however he may realize the simplicity of the daily life of its people.

The West.

105. Outside the cities communication was slow. One stage a week was enough for the connexion between the great cities; and communication elsewhere depended on private conveyance. The Western settlements were just beginning to make the question more serious. Enterprising land companies were the moving force which had impelled the passage of the Ordinance of 1787; and the first column of their settlers was pouring into Ohio and forming connexion with their predecessors in Kentucky and Tennessee. Marietta and Cincinnati had been founded. But the intending settlers were obliged to make the journey down the Ohio river from Pittsburg in bullet-proof flat-boats, for protection against the Indians, and the return trip depended on the use of oars. For more than twenty years these flat-boats were the chief means of river commerce in the West; and in the longer trips, as to New Orleans, the boats were generally broken up at the end and sold for lumber,

the crew making the trip home on foot or on horseback. John Fitch and others were already experimenting on what was soon to be the steamboat; but the statesman of 1789, looking at the task of keeping under one government a country of such distances, with such difficulties of communication, may be pardoned for having felt anxiety as to the future. To almost all thinking men of the time the Constitution was an experiment, and the unity of the new nation a subject for very serious doubt.

106. The comparative isolation of the people everywhere, the lack of books, the poverty of the schools and newspapers, were all influences which worked strongly against any pronounced literary development. Poems, essays and paintings were feeble imitations of European models; history was annalistic, if anything; and the drama hardly existed. In two points the Americans were strong, and had done good work. Such men as Jonathan Edwards had excelled in various departments of theology, and American preaching had reached a high degree of quality and influence; and, in the line of politics, the American state papers rank among the very best of their kind. Having a very clear perception of their political purposes, and having been restricted in study and reading to the great masters of pure and vigorous English, and particularly to the English translators of the Bible, the American leaders came to their work with an English style which could hardly have been improved. The writings of Franklin, Washington, the Adamses, Hamilton, Jefferson, Madison, Jay and others show the secret of their strength in every page. Much the same reasons, with the influences of democracy, brought oratory, as represented by Patrick Henry, Fisher Ames, John Randolph and others, to a point not very far below the mark afterwards reached by Daniel Webster. The effect of these facts on the subsequent development of the country is not often estimated at its full value. All through an immigration of every language and dialect under heaven the English language has been protected in its supremacy by the necessity of going back to the "fathers of the republic" for the first, and often the complete, statement of principles in every great political struggle, social problem or lawsuit.

Literature.

107. The cession of the "North-West Territory" by Virginia and New York had been followed up by similar cessions by Massachusetts (1785), Connecticut (1786) and South Carolina (1787). North Carolina did not cede Tennessee until early in 1790, nor Georgia her western claims until 1802. Settlement in all these regions was still very sparse. The centres of Western settlement, in Tennessee and Kentucky, had become more firmly established, and a new one, in Ohio, had just been begun. The whole western limits of settlement of the old thirteen states had moved much nearer their present boundaries; and the acquisition of the Western title, with the liberal policy of organization and government which had been begun, was to have its first clear effects during the first decade of the new government. Almost the only obstacle to its earlier success had been the doubts as to the attitude which the Spanish authorities, at New Orleans and Madrid, would take towards the new settlements. They had already asserted a claim that the Mississippi was an exclusively Spanish stream from its mouth up to the Yazoo, and that no American boat should be allowed to sail on this part of it. To the Western settler the Alleghanies and bad roads were enough to cut him off from any other way to a market than down the Mississippi; and it was not easy to restrain him from a forcible defiance of the Spanish claim. The Northern states were willing to allow the Spanish claim for a period of years in return for a commercial treaty; the Southern states and the Western settlers protested angrily; and once more the spectre of dissolution appeared, not to be laid again until the new government had made a treaty with Spain in 1795 (see PINCKNEY, THOMAS), securing common navigation of the Mississippi.

Limits of Settlement.

The Mississippi River.

108. Contemporary authorities agree that a marked change had come over the people since 1775, and few of them seem to think the change one for the better. Many attribute it to the looseness of manners and morals introduced by the French and British soldiers; others to the general effects of war; a few, Tories all, to the demoralizing effects of rebellion. The successful establishment of nationality would be enough to explain most of it; and if we remember that the new nation had secured its title to a vast western territory, of unknown but rich capacities, which it was now moving to reduce to possession by emigration, it would seem far more strange if the social conditions had not been somewhat disturbed.

Social Conditions.

G.—*The Development of Democracy, 1789–1801.*

109. All the tendencies of political institutions in the United States had certainly been towards democracy; but it cannot be said that the leading men were hearty or unanimous in their agreement with this tendency. Not a few of them were pronounced republicans even before 1775, but the mass of them had no great objections to a monarchical form of government until the war-spirit had converted them. The Declaration of Independence had been directed rather against *the* king than against *a* king. Even after popular sovereignty had pronounced against a king, class spirit was for some time a fair substitute for aristocracy. As often happens, democracy at least thought of a Caesar when it apprehended class control. Certain discontented officers of the Continental Army proposed to Washington that he become king, but he promptly and indignantly put the offer by. The suggestion of a return to monarchy in some form, as a possible road out of the confusion of the Confederation, occurs in the correspondence of some of the leading men; and while the Convention of 1787 was holding its secret sessions a rumour went out that it had decided to offer a crown to an English prince.

Democracy in the United States.

110. The state constitutions were democratic, except for property or other restrictions on the right of suffrage, or provisions carefully designed to keep the control of at least one house of the state legislature "in the hands of property." The Federal Constitution was so drawn that it would have lent itself kindly either to class control or to democracy. The electoral system of choosing the president and vice-president was altogether anti-democratic, though democracy has conquered it: not an elector, since 1796, has disobeyed the purely moral claim of his party to control his choice. Since the Senate was to be chosen by the state legislatures, "property," if it could retain its influence in those bodies, could control at least one house of Congress. The question whether the Constitution was to have a democratic or an anti-democratic interpretation was to be settled in the next twelve years.

111. The states were a strong factor in the final settlement, from the fact that the Constitution had left to them the control of the elective franchise: they were to make its conditions what each of them saw fit. Religious tests for the right of suffrage had been quite common in the colonies; property tests were almost universal. The former disappeared shortly after the War of Independence; the latter survived in some of the states far into the constitutional period. But the desire to attract immigration was always a strong impelling force to induce states, especially frontier states, to make the acquisition of full citizenship and political rights as easy and rapid as possible. This force was not so strong at first as it was after the great stream of immigration began about 1848, but it was enough to tend constantly to the development of democracy. In later times, when state laws allow the immigrant to vote even before the period assigned by Federal laws allows him to become a naturalized citizen, there have been demands for the modification of the ultra state democracy; but no such danger was apprehended in the first decade.

Influence of Immigration.

112. The Anti-Federalists had been a political party, but a party with but one principle. The absolute failure of that principle deprived the party of all cohesion; and the Federalists controlled the first two Congresses almost entirely. Their pronounced ability was shown in their organizing measures, which still govern the American system very largely. The departments of state, of the treasury, of war, of justice, and of the post-office were rapidly and successfully organized; acts were passed for the regulation of seamen, commerce, tonnage duties, lighthouses, intercourse with the Indians, Territories, and the militia; a national capital was selected; a national bank was chartered; the national debt was funded, and the state debts were assumed as

Organization of the New Government.

part of it. The first four years of the new system showed that the states had now to deal with a very different power from the impotent Congress of the Confederation. The new power was even able to exert pressure upon the two states which had not ratified the Constitution, though the pressure was made as gentle as possible. As a first step, the higher duties imposed on imports from foreign countries were expressly directed to apply to imports from North Carolina and Rhode Island. North Carolina having called a second convention, her case was left to the course of nature; and the second convention ratified the Constitution (November 21, 1789). The Rhode Island legislature asked that their state might not be considered altogether foreigners, made their duties agree with those of the new government, and reserved the proceeds for "continental" purposes. Still no further steps were taken. A bill was therefore introduced, directing the president to suspend commercial intercourse with Rhode Island, and to demand from her her share of the continental debt. This was passed by the Senate, and waited but two steps further to become law. Newspaper proposals to divide the little state between her two nearest neighbours were stopped by her ratification of the Constitution (May 29, 1790). The "old thirteen" were thus united under the Constitution; and yet, so strong is the American prejudice for the autonomy of the states that these last two were allowed to enter in the full conviction that they did so in the exercise of sovereign freedom of choice. Their entrance, however, was no more involuntary than that of others. If there had been real freedom of choice, nine states would never have ratified: the votes of Pennsylvania, Massachusetts, New Hampshire, Virginia and New York were only secured by the pressure of powerful minorities in these states, backed by the almost unanimous votes of the others.

Completion of the Union.

Hamiltonian Protection.

113. Protection was begun in the first Tariff Act, whose object, said its preamble, was the protection of domestic manufactures. The duties, however, ranged only from $7\frac{1}{2}$ to 10%, averaging about $8\frac{1}{2}$%. The system, too, had rather a political than an economic basis. Until 1789 the states had controlled the imposition of duties. The separate state feeling was a factor so strong that secession was a possibility which every statesman had to take into account. Hamilton's object, in introducing the system, seems to have been to create a class of manufacturers, running through all the states, but dependent for prosperity on the new Federal government and its tariff. This would be a force which would make strongly against any attempt at secession, or against the tendency to revert to control by state legislatures, even though it based the national idea on a conscious tendency towards the development of classes. The same feeling seems to have been at the bottom of his establishment of a national bank, his assumption of state debts, and most of the general scheme which his influence forced upon the Federalist party. (See HAMILTON, ALEXANDER; and FEDERALIST PARTY.)

The First Cabinet.

114. In forming his cabinet Washington had paid attention to the opposing elements which had united for the temporary purpose of ratifying the Constitution. The national element was represented by Hamilton, secretary of the treasury, and Henry Knox, secretary of war; the particularist element (using the term to indicate support of the states, not of a state) by Jefferson, secretary of state, and Edmund Randolph, attorney-general. At the end of 1792 matters were in train for the general recognition of the existence of two parties, whose struggles were to decide the course of the Constitution's development. The occasion came in the opening of the following year, when the new nation was first brought into contact with the French Revolution.

The Jefferson School of Politics.

115. The controlling tendency of Jefferson and his school was to the maintenance of individual rights at the highest possible point, as the Hamilton school was always ready to assert the national power to restrict individual rights for the general good. Other points of difference are rather symptomatic than essential. The Jefferson school supported the states, in the belief that they were the best bulwarks for individual rights. When the French Revolution began its usual course in America by agitation for the "rights of man," it met a sympathetic audience in the Jefferson party and a cold and unsympathetic hearing from the Hamilton school of Federalists. The latter were far more interested in securing the full recognition of the power and rights of the nation than in securing the individual against imaginary dangers, as they thought them. For ten years the surface marks of distinction between the two parties were to be connected with the course of events in Europe; but the essence of distinction was not in the surface marks.

The Hamilton School.

116. The new government was not yet four years old; it was not familiar, nor of assured permanency. The only national governments of which Americans had had previous experience were the British government and the Confederation: in the former they had had no share, and the latter had had no power. The only places in which they had had long-continued, full, and familiar experience of self-government were their state governments: these were the only governmental forms which were then distinctly associated in their minds with the general notion of republican government. The governing principle of the Hamilton school, that the construction or interpretation of the terms of the Constitution was to be such as to broaden the powers of the Federal government, necessarily involved a corresponding trenching on the powers of the states. It was natural, then, that the Jefferson school should look on every feature of the Hamilton programme as "anti-republican," meaning, probably, at first no more than opposed to the state system, though the term soon came to imply something of monarchical and, more particularly, of English tendencies. The disposition of the Jefferson school to claim for themselves a certain peculiar title to the position of "republicans" developed into the appearance of the first Republican, or the Democratic-Republican, party, about 1793.

Party Differences.

117. Many of the Federalists were shrewd and active business men, who naturally took prompt advantage of the opportunities which the new system offered. The Republicans therefore believed and asserted that the whole Hamilton programme was dictated by selfish or class interest; and they added this to the accusation of monarchical tendencies. These charges, with the fundamental differences of mental constitution, exasperated by the passion which differences as to the French Revolution seemed to carry with them everywhere, made the political history of this decade a very unpleasant record. The provision for establishing the national capital on the Potomac (1790) was declared to have been carried by a corrupt bargain; and accusations of corruption were renewed at every opportunity. In 1793 a French agent, Edmond Charles Edouard Genet (1765–1834), appeared to claim the assistance of the United States for the French republic, and went to the length of commissioning privateers and endeavouring to secure recruits, especially for a force which he expected to raise for the conquest of Louisiana from Spain. Washington decided to issue a proclamation of neutrality, the first act of the kind in American history. It was the first indication, also, of the policy which has made the course of every president, with the exception of Polk, a determined leaning to peace, even when the other branches of the government have been intent on war. Genet, however, continued his activities, and made outrageous demands upon the government, so that finally Washington demanded and secured (1794) his recall.[1] The proclamation of 1793 brought about the first distinctly party feeling; and it was intensified by Washington's charge that popular opposition in western Pennsylvania (1794) to the new excise law (see WHISKY INSURRECTION) had been fomented by the extreme French party. Their name, Democrat, was applied by the Federalists to the whole Republican party as a term of contempt, but it was not accepted by the party for some twenty years; then the compound title "Democratic-Republican" became, as it

Admission of Vermont, Kentucky and Tennessee.

[1] Genet, fearing the fate of his fellow Girondists in France, remained in the United States and became a naturalized American citizen.

still is, the official title of the party. There was no party opposition, however, to the re-election of Washington in 1792, or to the admission of Vermont (1791), Kentucky (1792) and Tennessee (1796) as new states.

118. The British government had accredited no minister to the United States, and it refused to make any commercial treaty or to give up the forts in the western territory of the United States, through which its agents still exercised a commanding influence over the Indians. In the course of its war with France, the neutral American vessels, without the protection of a national navy, fared badly. A treaty negotiated in 1794 by Chief-Justice John Jay (*q.v.*) settled these difficulties for the following twelve years. **Jay's Treaty.** But, as it engaged the United States against any intervention in the war on behalf of France, was silent on the subject of the right of search, and agreed to irksome limitations on the commercial privileges of the United States, the Republicans, who were opposed to the negotiation of any treaty at this time with Great Britain, made it very unpopular, and the bitter personal attacks on Washington grew out of it. In spite of occasional Republican successes, the Federalists retained a general control of national affairs; they elected John Adams president in 1796, **Election of 1796.** though Jefferson was chosen vice-president with him; and the national policy of the Federalists kept the country out of entangling alliances with any of the European belligerents. To the Republicans, and to the French republic, this last point of policy was only a practical intervention against France and against the rights of man.

119. At the end of Washington's administration the French Directory broke off relations with the United States, demanding the abrogation of Jay's treaty and a more pronounced sympathy with France. Adams sent three envoys, C. C. Pinckney (*q.v.*), John Marshall and Elbridge Gerry (*q.v.*), to endeavour to re-establish the former relations; they were met by demands for "money, a great deal of money," as a prerequisite to peace. **The "X.Y.Z." Mission.** They refused; their letters home were published,[1] and the Federalists at last had the opportunity of riding the whirlwind of an intense popular desire for war with France. Intercourse with France was suspended by Congress (1798); the treaties with France were declared at an end; American frigates were authorized to capture French vessels guilty of depredations on American commerce, and the president was authorized to issue letters of marque and reprisal; and an American army was formed, Washington being called from his retirement at Mount Vernon to command it. The war never went beyond a few sea-fights, in which the little American navy **Quasi-war with France.** did itself credit, and Napoleon, seizing power the next year, renewed the peace which should never have been broken. But the quasi-war had internal consequences to the young republic which surpassed in interest all its foreign difficulties: it brought on the crisis which settled the development of the United States towards democracy.

120. The reaction in Great Britain against the indefinite "rights of man" had led parliament to pass an alien law, a sedition law suspending the writ of *habeas corpus*, and an act giving wide and loosely defined powers to magistrates for the dispersion of meetings to petition for redress of grievances. **Error of the Federalists.** The Federalists were in control of a Congress of limited powers; but they were strongly tempted by sympathies and antipathies of every sort to form their programme on the model furnished from England. The measures which they actually passed were based only on that construction of the Constitution which is at the bottom of all American politics; they only tended to force the Constitution into an anti-democratic direction. But it was the fixed belief of their opponents that they meant to go farther, and to secure control by some wholesale measure of political persecution.

121. Three alien laws were passed in June and July 1798. The first (repealed in April 1802) raised the number of years necessary for naturalization from five to fourteen. The third (still substantially in force) permitted the arrest or removal of subjects of any foreign power with which the United States should be at war. **The Alien and Sedition Laws.** The second, which is usually known as the Alien Law, was limited to a term of two years; it permitted the president to arrest or order out of the country any alien whom he should consider dangerous to the country. As many of the Republican editors and local leaders were aliens, this law really put a large part of the Republican organization in the power of the president elected by their opponents. The Sedition Law (to be in force until March 1801 and not renewed) made it a crime, punishable by fine and imprisonment, to publish or print any false, scandalous and malicious writings against the government of the United States, either house of Congress, or the president, or to stir up sedition or opposition to any lawful act of Congress or of the president, or to aid the designs of any foreign power against the United States. In its first form the bill was even more sweeping than this and alarmed the opposition thoroughly.

122. Most of the ability of the country was in the Federalist ranks; the Republicans had but two first-rate men—Jefferson and Madison. In the sudden issue thus forced between individual rights and national power, **The Republican Opposition.** Jefferson and Madison could find but one bulwark for the individual—the power of the states; and their use of it gave their party a pronounced list to state sovereignty from which it did not recover for years. They objected to the Alien Law on the grounds that aliens were under the jurisdiction of the state, not of the Federal government; that the jurisdiction over them had not been transferred to the Federal government by the Constitution, and that the assumption of it by Congress was a violation of the Constitution's reservation of powers to the states; and, further, because the Constitution reserved to every "person," not to every citizen, the right to a jury trial. They objected to the Sedition Law on the grounds that the Constitution had specified exactly the four crimes for whose punishment Congress was to provide; that criminal libel was not one of them; and that amendment I. forbade Congress to pass any law restricting freedom of speech or of the press. The Federalists asserted a common-law power in Federal judges to punish for libel, and pointed to a provision in the Sedition Law permitting the truth to be given in evidence, as an improvement on the common law, instead of a restriction on liberty.

123. The Republican objections might have been made in court, on the first trial. But the Republican leaders had strong doubts of the impartiality of the Federal judges, who were Federalists. They resolved to entrench the party in the state legislatures. The Virginia legislature in 1798 passed a series of resolutions prepared by Madison, **Virginia and Kentucky Resolutions.** and the Kentucky legislature in the same year passed a series prepared by Jefferson (see KENTUCKY: *History*). Neglected or rejected by the other states, they were passed again by their legislatures in 1799, and were for a long time a documentary basis of the Democratic party. The leading idea expressed in both was that the Constitution was a "compact" between the states, and that the powers (the states) which had made the compact had reserved the power to restrain the creature of the compact, the Federal government, whenever it undertook to assume powers not granted to it. Madison's idea seems to have been that the restraint was to be imposed by a second convention of the states. Jefferson's idea is more doubtful; if it meant that the restraint should be imposed by any state which should feel aggrieved, his scheme was merely Calhoun's idea of nullification; but there are some indications that he agreed with Madison.

124. The first Congress of Adams's term of office ended in 1799. Its successor, elected in the heat of the French war excitement, kept the Federalist policy up to its first pitch. Out of Congress the execution of the objectionable laws **Effects of the Laws.** had taken the shape of political persecution. Men were arrested, tried and punished for writings which the people had

[1] In these letters as published the letters X, Y and Z were substituted for the names of the French agents with whom the American envoys dealt; and the letters are known as the X Y Z correspondence.

been accustomed to consider within legitimate political methods. The Republican leaders made every trial as public as possible, and gained votes constantly, so that the Federalists began to be shy of the very powers which they had sought. Every new election was a storm-signal for the Federalist party; and the danger was increased by schism in their own ranks.

125. Hamilton was now a private citizen of New York; but he had the confidence of his party more largely than its nominal head, the president, and he maintained close and confidential relations with the cabinet which Adams had taken unchanged from Washington. The Hamilton faction saw no way of preserving and consolidating the newly acquired powers of the Federal government but by keeping up and increasing the war feeling against France; Adams had the instinctive leaning of an American president towards peace. Amid cries of wrath and despair from his party he accepted the first overtures of the new Napoleonic government, sent envoys to negotiate a peace, and ordered them to depart for France when they delayed too long. Then, discovering flat treachery in his cabinet, he dismissed it and blurted out a public expression of his feeling that Hamilton and his adherents were "a British faction." Hamilton retorted with a circular letter to his party friends, denouncing the president; the Republicans intercepted it and gave it a wider circulation than its author had intended; and the Hamilton faction tried so to arrange the electoral vote that C. C. Pinckney should be chosen president in 1800 and Adams should be shelved into the vice-presidency. The result depended on the electoral vote of New York; and Aaron Burr, who had introduced the drill and machinery of a modern American political party there, had made the state Republican and secured a majority for the Republican candidates. These (Jefferson and Burr) received the same number of electoral votes (73),[1] and the House of Representatives (controlled by the Federalists) was thus called upon to decide which should be president. There was an effort by the Federalists to disappoint the Republicans by making Burr president; but Jefferson obtained that office, Burr becoming vice-president for four years. This disputed election, however, led to the adoption in 1804 of the 12th amendment to the Constitution, which prescribed that each elector should vote separately for president and vice-president, and thus prevent another tie vote of this kind; this amendment, moreover, made very improbable the choice in the future of a president and a vice-president from opposing parties.

Federalist Schism.

Election of 1800.

126. The "Revolution of 1800" decided the future development of the United States. The new dominant party entered upon its career weighted with the theory of state sovereignty; and a civil war was necessary before this dogma, put to use again in the service of slavery, could be banished from the American system. But the democratic development never was checked. From that time the interpretation of the Federal Constitution has generally favoured individual rights at the expense of governmental power. As the Republicans obtained control of the states they altered the state constitutions so as to cut out all the arrangements that favoured property or class interests, and reduced political power to the dead level of manhood suffrage. In most of the states outside of New England this process was completed before 1815; but New England tenacity was proof against the advancing revolution until about 1820. For twenty years after its downfall of 1800 the Federalist party maintained its hopeless struggle, and then it faded away into nothing, leaving as its permanent memorial the excellent organization of the Federal government, which its successful rival hardly changed. Its two successors—the Whig and the second Republican party—have also been broad-constructionist parties, but they have admitted democracy as well; the Whig party adopted popular methods at least, and the Republican went further in the direction of individual rights, securing the emancipation of enslaved labour.

"Revolution of 1800."

[1] Adams received 65, Pinckney 64 and John Jay 1.

127. The disputed election of 1800 was decided in the new capital city of Washington, to which the government had just been removed, after having been for ten years at Philadelphia. Its streets and parks existed only on paper. The Capitol had been begun; the Executive Mansion was unfinished, and its audience room was used by Mrs Adams as a drying room for clothes; and the congressmen could hardly find lodgings. The inconveniences were only an exaggeration of the condition of other American cities. Their sanitary conditions were bad, and yellow fever and cholera from time to time reduced several of them almost to depopulation. More than once, during this decade, the fever visited Philadelphia and New York, drove out most of the people, and left grass growing in the streets. The communication between the cities was still wretched. The traveller was subject to every danger or annoyance that bad roads, bad carriages, bad horses, bad inns and bad police protection could combine to inflict upon him. But the war with natural obstacles had fairly begun, though it had little prospect of success until steam was brought into use as the ally of man.

The New Capital.

128. About this time the term "the West" appears. It meant then the western part of New York, the new territory north of the Ohio, and Kentucky and Tennessee. In settling land boundaries New York had transferred (1786) to Massachusetts, whose claims crossed her territory, the right to (but not jurisdiction over) a large tract of land in central New York, and to another large tract in the Erie basin. The sale of this land had carried population considerably west of the Hudson. After other expeditions against the Ohio Indians had been defeated, one under General Anthony Wayne had compelled them in 1794–95 to give up all the territory now in the state of Ohio. Settlement received a new impetus. Between 1790 and 1800 the population of Ohio had risen from almost nothing to 45,000, that of Tennessee from 36,000 to 106,000, and that of Kentucky from 74,000 to 221,000—the last-named state now exceeding six of the "old thirteen" in population. The difficulties of the western emigrant, however, were still enormous. He obtained land of his own, fertile land and plenty of it, but little else. The produce of the soil had to be consumed at home, or near it; ready money was scarce and distant products scarcer; and comforts, except the very rudest substitutes of home manufacture, were unobtainable. The new life bore most hardly upon women; and, if the record of woman's share in the work of American colonization could be fully made up, the price paid for the final success would seem enormous.

The West.

129. The number of post offices rose during these ten years from 75 to 903, the miles of post routes from 1900 to 21,000, and the revenue from $38,000 to $231,000. These figures seem small in comparison with the 61,158 post offices, 430,738 m. of post routes (besides 943,087 m. of rural delivery routes), and a postal revenue of $191,478,663 in 1908, but the comparison with the figures of 1790 shows a development in which the new Constitution, with its increased security, must have been a factor.

Post Office.

130. The power of Congress to regulate patents was already bearing fruit. Until 1789 this power was in the hands of the states, and the privileges of the inventor were restricted to the territory of the patenting state. Now he had a vast and growing territory within which all the profits of the invention were his own. Twenty patents were issued in 1793, and 23,471 one hundred years afterwards; but one of the inventions of 1793 was Eli Whitney's cotton gin.

Patents.

131. When the Constitution was adopted it was not known that the cultivation of cotton could be made profitable in the Southern states. The "roller gin" could clean only 6 ℔ a day by slave labour. In 1784 eight bags of cotton, landed in Liverpool from an American ship, were seized on the ground that so much cotton could not be the produce of the United States. Eli Whitney (*q.v.*) invented the saw-gin, by which the cotton was dragged through parallel wires with openings too narrow to allow the seeds to pass; and one slave could now clean 1000 ℔ a day. The exports of cotton leaped from 189,000 ℔ in

Cotton.

1791 to 21,000,000 lb in 1801, and doubled in three years more. The influence of this one invention, combined with the wonderful series of British inventions which had paved the way for it, can hardly be estimated in its commercial aspects. Its political influences were even wider, but more unhappy. The introduction of the commercial element into the slave system of the South robbed it at once of the patriarchal features which had made it tolerable; while it developed in slave-holders a new disposition to defend a system of slave labour as a "positive good." The abolition societies of the South began to dwindle as soon as the results of Whitney's invention began to be manifest.

Slavery and Democracy.

132. The development of a class whose profits were merely the extorted natural wages of the black labourer were certain; and its political power was as certain, though it never showed itself clearly until after 1830. And this class was to have a peculiarly distorting effect on the political history of the United States. Aristocratic in every sense but one, it was ultra-Democratic (in a purely party sense) in its devotion to state sovereignty, for the legal basis of the slave system was in the laws of the several states. In time, the aristocratic element got control of the party which had originally looked to state rights as a bulwark of individual rights; and the party was finally committed to the employment of its original doctrine for an entirely different purpose—the suppression of the black labourer's wages.

H.—*Democracy and Nationality, 1801–1829*

Democracy and Nationality.

133. When Jefferson took office in 1801 he succeeded to a task larger than he imagined. His party, ignoring the natural forces which tied the states together even against their wills, insisted that the legal basis of the bond was in the power of any state to withdraw at will. This was no nationality; and foreign nations naturally refused to take the American national coin at any higher valuation than that at which it was current in its own country. The urgent necessity was for a reconciliation between democracy and nationality; and this was the work of this period. An underlying sense of all this has led Democratic leaders to call the war of 1812–15 the "Second War of Independence"; the result was as much independence of past ideas as of Great Britain.

Louisiana.

134. The first force in the new direction was the acquisition of Louisiana in 1803. Napoleon had acquired it from Spain, and, fearing an attack upon it by Great Britain, offered it to the United States for $15,000,000. The Constitution gave the Federal government no power to buy and hold territory, and the party was based on a strict construction of the constitution. Possession of power forced the strict-construction party to broaden its ideas, and Louisiana was bought, though Jefferson quieted his conscience by talking for a time of a futile proposal to amend the Constitution so as to grant the necessary power. (See LOUISIANA PURCHASE; and JEFFERSON, THOMAS.) The acquisition of the western Mississippi basin more than doubled the area of the United States, and gave them control of all the great river-systems of central North America. The difficulties of using these rivers were removed almost immediately by Robert Fulton's utilization of steam in navigation (1807). Within four years steamboats were at work on western waters; and thereafter the increase of steam navigation and that of population stimulated one another. The "centre of population" has been carefully ascertained by the census authorities for each decade, and it represents the westward movement of population very closely. During this period it advanced from about the middle of the state of Maryland to its extreme western limit; that is, the centre of population was in 1830 nearly at the place which had been the western limit of population in 1770.

The Steamboat.

Centre of Population.

135. Jefferson also laid the basis for a further acquisition in the future by sending an expedition under Meriwether Lewis (*q.v.*) and William Clark to explore the territory north of the then Spanish territory of California and west of the Rocky Mountains—the "Oregon country" as it was afterwards called. The explorations of this party (1804–1806), with Captain Robert Gray's discovery of the Columbia river (1792), made the best part of the claims of the United States to the country forty years later.

The Oregon Country.

Election of 1804.

136. Jefferson was re-elected in 1804,[1] serving until March, 1809; his party now controlled almost all the states outside of New England, and could elect almost any one whom it chose to the presidency. Imitating Washington in refusing a third term of office, Jefferson established more firmly the precedent, not since violated, restricting a president to two terms, though the Constitution contains no such restriction. The great success of his presidency had been the acquisition of Louisiana, which was a violation of his party principles; but all his minor successes were, like this, recognitions of the national sovereignty which he disliked so much. After a short and brilliant naval war the Barbary pirates were reduced to submission (1805). The long-continued control of New Orleans by Spain, and the persistent intrigues of the Spanish authorities, looking towards a separation of the whole western country from the United States, had been ended by the acquisition of Louisiana, and the full details concerning them will probably remain for ever hidden in the secret history of the early West. They had left behind a dangerous ignorance of Federal power and control, of which Aaron Burr (*q.v.*) took advantage (1806–07). Organizing an expedition in Kentucky and Tennessee, probably for the conquest of the Spanish colony of Mexico, he was arrested on the lower Mississippi and brought back to Virginia. He was acquitted; but the incident opened up a vaster view of the national authority than democracy had yet been able to take. It had been said, forty years before, that Great Britain had long arms, but that three thousand miles was too far to extend them; it was something to know now that the arms of the Federal government were long enough to reach from Washington city to the Mississippi.

Difficulties with Great Britain.

137. All the success of Jefferson was confined to his first four years; all his heavy failures were in his second term, in which he and his party as persistently refused to recognize or assert the inherent power of the nation in international affairs. The Jay treaty expired in 1806 by limitation, and American commerce was thereafter left to the course of events, Jefferson refusing to accept the only treaty which the British government was willing to make. All the difficulties which followed may be summed up in a few words: the British government was then the representative of the ancient system of restriction of commerce, and had a powerful navy to enforce its ideas; the American government was endeavouring to force into international recognition the present system of neutral rights and unrestricted commerce, but its suspicious democracy refused to give it a navy sufficient to command respect. The American government apparently expected to gain its objects without the exhibition of anything but moral force.

Neutral Commerce.

138. Great Britain was now at war, from time to time, with almost every other nation of Europe. In time of peace European nations followed generally the old restrictive principle of allowing another nation, like the United States, no commercial access to their colonies; but, when they were at war with Great Britain, whose navy controlled the ocean, they were very willing to allow the neutral American merchantmen to carry away their surplus colonial produce. Great Britain had insisted for fifty years that the neutral nation, in such cases, was really intervening in the war as an ally of her enemy; but she had so far modified her claim as to admit that "transhipment," or breaking bulk, in the United States was enough to qualify the commerce for recognition. The neutral nation thus gained a double freight, and grew rich in the traffic; the belligerent nations no longer had commerce afloat for British vessels to capture; and the "frauds of the neutral flags" became a standing subject of complaint among British merchants and naval officers. About 1805 British prize courts

[1] Jefferson received 162 electoral votes and his opponent, C. C. Pinckney, only 14.

began to disregard transhipment and to condemn American vessels which made the voyage from a European colony to the mother country by way of the United States. This was really a restriction of American commerce to purely American productions, or to commerce with Great Britain direct, with the payment of duties in British ports.

Expatriation.

139. The question of expatriation, too, furnished a good many burning grievances. Great Britain maintained the old German rule of perpetual allegiance, though she had modified it by allowing the right of emigration. The United States, founded by immigration, was anxious to establish what Great Britain was not disposed to grant, the right of the subject to divest himself of allegiance by naturalization under a foreign jurisdiction. Four facts thus tended to break off friendly relations: (1) Great Britain's claim to allegiance over American naturalized subjects; (2) her claim to the belligerent right of search of neutral vessels; (3) her claim of right to impress for her vessels of war her subjects who were seamen wherever found; and (4) the difficulty of distinguishing native-born American from British subjects, even if the right to impress naturalized American subjects were granted. British naval officers even undertook to consider all who spoke the English language as British subjects, unless they could produce proof that they were native-born Americans. The American sailor who lost his papers was thus open to impressment. A particularly flagrant case of seizure of Americans occurred in 1807. On the 27th of June the British ship "Leopard" fired upon the American frigate "Chesapeake," which, after having lost 3 men killed and 18 wounded, hauled down its flag; the British commander then seized four of the "Chesapeake's" crew. This action aroused intense anger throughout the country, and but for the impotence of the government would undoubtedly have led to immediate war. The American government in 1810 published the cases of such impressments since 1803 as numbering over 4000, about one-third of the cases resulting in the discharge of the impressed man; but no one could say how many cases had never been brought to the attention of a government which never did anything more than remonstrate about them.

Impressment.

Orders in Council.

140. In May 1806 the British government, by orders in council, declared a blockade of the whole continent of Europe from Brest to the Elbe, about 800 m. In November, after the battle of Jena, Napoleon answered by the "Berlin decree," in which he assumed to blockade the British Isles, thus beginning his "continental system." A year later the British government answered by further orders in council, forbidding American trade with any country from which the British flag was excluded, allowing direct trade from the United States to Sweden only, in American products, and permitting American trade with other parts of Europe only on condition of touching in England and paying duties. Napoleon retorted with the "Milan decree," declaring good prize any vessel which should submit to search by a British ship; but this was evidently a vain fulmination.

Berlin and Milan Decrees.

The Navy.

141. The Democratic party of the United States was almost exclusively agricultural and had little knowledge of or sympathy with commercial interests; it was pledged to the reduction of national expenses and the debt, and did not wish to take up the responsibility for a navy; and, as the section of country most affected by the orders in council, New England, was Federalist, and made up of the active and irreconcilable opposition, a tinge of political feeling could not but colour the decisions of the dominant party. Various ridiculous proposals were considered as substitutes for a necessarily naval war; and perhaps the most ridiculous was adopted. Since the use of non-intercourse agreements as revolutionary weapons against Great Britain, an overweening confidence in such measures had sprung up, and one of them was now resorted to—the embargo of the 22nd of December 1807, forbidding foreign commerce altogether. It was expected to starve Great Britain into a change of policy; and its effects may be seen by comparing the $20,000,000 exports of 1790, $49,000,000 of 1807 and $9,000,000 of 1808. It does not seem to have struck those who passed the measure that the agricultural districts also might find the change unpleasant; but that was the result, and their complaints reinforced those of New England, and closed Jefferson's second term in a cloud of recognized misfortune. The pressure had been slightly relieved by the substitution of the Non-Intercourse Law of the 1st of March 1809 for the embargo; it prohibited commercial intercourse with Great Britain and France and their dependencies, leaving other foreign commerce open, prohibited the importation from any quarter of British and French goods, and forbade the entrance of British or French vessels, public or private, into any port of the United States. Madison, Jefferson's secretary of state, who succeeded Jefferson in 1809, having defeated the Federalist candidate C. C. Pinckney in the election of 1808, assumed in the presidency a burden which was not enviable. New England was in a ferment, and was suspected of designs to resist the restrictive system by force; and the administration did not face the future with confidence.

The Embargo.

Non-intercourse Law.

Election of 1808.

142. The Non-Intercourse Law was to be in force only "until the end of the next session of Congress" and was to be abandoned as to either belligerent which should abandon its attacks on neutral commerce, and maintained against the other. In 1810 the American government was led to believe that France had abandoned its system. Napoleon continued to enforce it in fact; but his official fiction served its purpose of limiting the non-intercourse for the future to Great Britain, and thus straining relations between that country and the United States still further. The elections of 1811–1812 resulted everywhere in the defeat of "submission men" and in the choice of new members who were determined to resort to war against Great Britain. Henry Clay, John C. Calhoun, William H. Crawford and other new men seized the lead in the two houses of Congress, and forced Madison, it is said, to agree to a declaration of war as a condition of his renomination in 1812 when he defeated De Witt Clinton by an electoral vote of 128 to 89. (See MADISON.) Madison sent to Congress a confidential "war message" on the 1st of June and on the 18th war was declared. The New England Federalists always called it "Mr Madison's war," but the president was about the most unwilling participant in it.

Election of 1812.

War with England.

Tippecanoe.

143. The national democracy meant to attack Great Britain in Canada, partly to gratify its western constituency, who had been harassed by Indian attacks, asserted to have been instigated from Canada. Premonitions of success were drawn from the battle of Tippecanoe, in which William Henry Harrison had defeated in 1811 the north-western league of Indians formed by Tecumseh (*q.v.*). Between the solidly settled Atlantic states and the Canadian frontier was a wide stretch of unsettled or thinly settled country, which was itself a formidable obstacle to war. Ohio had been admitted as a state in 1802, and Louisiana was admitted in 1812; but their admission had been due to the desire to grant them self-government rather than to their full development in population and resources. Cincinnati was a little settlement of 2500 inhabitants; the fringe of settled country ran not very far north of it; and all beyond was a wilderness of which little was known to the authorities. The case was much the same with western New York; the army which was to cross the Niagara river must journey almost all the way from Albany through a very thinly peopled country. It would have been far less costly, as events proved, to have entered at once upon a naval war; but the crusade against Canada had been proclaimed all through Kentucky and the West, and their people were determined to wipe out their old scores before the conclusion of the war. (For the military and naval events of the war see AMERICAN WAR OF 1812.)

Theatre of the War.

144. The war opened with disaster—General William Hull's surrender of Detroit; and disaster attended it for two years. Political appointments to positions in the regular army were

numerous, and such officers were worse than useless. The war department showed no great knowledge, and poverty put its little knowledge out of service. *Disaster by Land.* Futile attempts at invasion were followed by defeat or abortion, until the political officers were weeded out at the end of the year 1813, and Jacob Brown, Winfield Scott, E. W. Ripley and others who had fought their way up were put in command. Then for the first time the men were drilled and brought into effective condition; and two successful battles in 1814—Chippewa and Lundy's Lane—threw some glory on the end of the war. *Chippewa and Lundy's Lane.* So weak were the preparations even for defence that a British expedition in 1814 met no effective resistance when it landed and burned Washington. *Washington Burnt.* For some of the disasters the responsibility rested as much, or more, upon the war department as upon the officers and soldiers in the field.

145. The American navy was but a puny adversary for the British navy, which had captured or shut up in port all the other navies of Europe. *State of the Navy.* But the small number of American vessels, with the superabundance of trained officers, gave them one great advantage: the training and discipline of the men, and the equipment of the vessels, had been brought to the very highest point. Captains who could command a vessel but for a short time, yielding her then to another officer who was to take his sea service in rotation, were all ambitious to make their mark during their term. "The art of handling and fighting the old broadside sailing frigate" had been carried in the little American navy to a point which unvarying success and a tendency to fleet-combats had now made far less common among British captains. Altogether the American vessels gave a remarkably good account of themselves.

146. The home dislike to the war had increased steadily with the evidence of incompetent management by the administration. *Feeling in New England.* The Federalists, who had always desired a navy, pointed to the naval successes as the best proof of folly with which the war had been undertaken and managed. New England Federalists complained that the Federal government utterly neglected the defence of their coast, and that Southern influence was far too strong in national affairs. They showed at every opportunity a disposition to adopt the furthest stretch of state sovereignty, as stated in the Kentucky Resolutions; and every such development urged the national democracy unconsciously further on the road to nationality. When the New England states sent delegates to meet at Hartford, Conn. (*q.v.*), and consider their grievances and the best remedies—a step perfectly proper on the Democratic theory of a "voluntary Union"— *Hartford Convention.* treason was suspected, and a readiness to suppress it by force was plainly shown. The recommendations of the convention came to nothing; but the attitude of the dominant party towards it is one of the symptoms of the manner in which the trials of actual war were steadily reconciling democracy and nationality. The object which Hamilton had sought by high tariffs and the development of national classes had been attained by more natural and healthy means.

147. In April 1814 the first abdication of Napoleon took place, and Great Britain was able to give more attention to her American antagonist. *Peace.* The main attack was to be made on Louisiana, the weakest and most distant portion of the Union. A fleet and army were sent thither, but the British assault was completely repulsed (Jan. 8, 1815) by the Americans under Andrew Jackson. Peace had been made at Ghent fifteen days before the battle was fought, but the news of the battle and the peace reached Washington almost together, the former going far to make the latter tolerable.

148. The United States really secured a fairly good treaty. It is true that it said not a word about the questions of impressment, search and neutral rights, the grounds of the war; Great Britain did not abandon her position on any of them. But everybody knew that circumstances had changed. The new naval power whose frigates alone in the past twenty years had shown their ability to fight English frigates on equal terms was not likely to be troubled in future with the question of impressment; and in fact, while not renouncing the right, the British government no longer attempted to enforce it. The navy, it must be confessed, was the force which had at last given the United States a recognized and cordial acceptance in the family of nations; it had solved the problem of the reconciliation of democracy and nationality.

149. The remainder of this period is one of the barrenest in American history. The opposition of the Federalist party to the war completed the measure of its unpopularity, and it had only a perfunctory existence for a few years longer. *Extinction of the Federalist Party.* Scandal, intrigue and personal criticism became the most marked characteristics of American politics until the dominant party broke at the end of the period, and real party conflict was renewed. But the seeds of the final disruption are visible from the peace of 1814. The old-fashioned Republicans looked with intense suspicion on the new form of Republicanism generated by the war, a type which instinctively bent its energies toward the further development of national power. Clay was the natural leader of the new Democracy; but John Quincy Adams and others of Federalist antecedents or leanings took to the new doctrines kindly; and even Calhoun, Crawford and others of the Southern interest were at first strongly inclined to support them. One of the first effects was the revival of protection and of a national bank.

150. The charter of the national bank had expired in 1811, and the dominant party had refused to recharter it. The attempt to carry on the war by loans resulted in almost a bankruptcy and in a complete inability to act efficiently. *Bank of the United States.* As soon as peace gave time for consideration, a second bank was chartered (April 10, 1816) for twenty years, with a capital of $35,000,000, one-fifth of which was to be subscribed for by the national government. It was to have the custody of the government revenues, but the secretary of the treasury could divert the revenues to other custodians, giving his reasons for such action to Congress.

151. Protection was advocated again on national grounds, but not quite on those which had moved Hamilton. The additional receipts were now to be expended for fortifications and other national defences, and for national roads *Protection.* and canals, the latter to be considered solely as military measures, with an incidental benefit to the people. Business distress among the people gave additional force to the proposal. The war and blockade had been an active form of protection, under which American manufactures had sprung up in great abundance. As soon as peace was made English manufacturers drove their American rivals out of business or reduced them to desperate straits. Their cries for relief had a double effect. They gave the spur to the nationalizing advocates of protection, and, as most of the manufacturers were in New England or New York, they developed in the citadel of Federalism a class which looked for help to a Republican Congress, and was therefore bound to oppose the Federalist party. This was the main force which brought New England into the Republican fold before 1825. *Manufactures.* An increase in the number of spindles from 80,000 in 1811 to 500,000 in 1815, and in cotton consumption from 500 bales in 1800 to 90,000 in 1815, the rise of manufacturing towns, and the rapid development of the mechanical tendencies of a people who had been hitherto almost exclusively agricultural, were influences which were to be reckoned with in the politics of a democratic country.

152. The tariff of 1816 imposed a duty of about 25% on imports of cotton and woollen goods, and specific duties on iron imports, except pig-iron, on which there was an *ad valorem* duty of 20%. *Tariff of 1816.* In 1818 this duty also was made specific (50 cents a cwt.). The *ad valorem* duties carried most of the manufacturers through the financial crisis of 1818–1819, but the iron duties were less satisfactory. In English manufacture the substitution of coke for charcoal in iron production led to continual decrease in price. As the price went down the specific duties were continually increasing the absolute amount of protection. Thus spared the necessity for improvements

in production, the American manufacturers felt English competition more keenly as the years went by, and called for more protection.

153. James Monroe (*q.v.*) succeeded Madison as president in 1817, and, re-elected with hardly any opposition in 1820, he served until 1825.[1] So complete was the supremacy of the Republican party that this is often called "the era of good feeling." It came to an end when a successor to Monroe was to be elected; the two sections of the dominant party then had their first opportunity for open struggle. During Monroe's two terms of office the nationalizing party developed the policy on which it proposed to manage national affairs. This was largely the product of the continually swelling western movement of population. The influence of the steamboat was felt more and more every year, and the want of a similar improvement in land transport was correspondingly evident. The attention drawn to western New York by the war had filled that part of the state with a new population. The southern Indians had been completely overthrown by Andrew Jackson during the War of 1812, and forced to cede their lands. The admission of the new states of Indiana (1816), Mississippi (1817), Illinois (1818), Alabama (1819), Maine (1820) and Missouri (1821)—all but Maine the product and evidence of western growth—were the immediate results of the development consequent upon the war. All the territory east of the Mississippi, except the northern part of the North-West Territory, was now formed into self-governing states; the state system had crossed the Mississippi; all that was needed for further development was the locomotive engine. The four millions of 1790 had grown into thirteen millions in 1830; and there was a steady increase of one-third in each decade.

"Era of Good Feeling."

Admission of New States.

154. The urgent demand of western settlers for some road to a market led to a variety of schemes to facilitate intercourse between the East and the West—the most successful being that completed in New York in 1825, the Erie Canal. The Hudson river forms the great natural breach in the barrier range which runs parallel to the Atlantic coast. When the traveller has passed up the Hudson through that range he sees before him a vast champaign country extending westward to the Great Lakes, and perfectly adapted by nature for a canal. Such a canal, to turn western traffic into the lake rivers and through the lakes, the canal, and the Hudson to New York City, was begun by the state through the influence of De Witt Clinton, was derisively called "Clinton's big ditch" until its completion, and laid the foundations for the great commercial prosperity of New York state and city. Long before it was finished the evident certainty of its success had seduced other states into far less successful enterprises of the kind and had established as a nationalizing policy the combination of high tariffs and expenditures for internal improvements which was long known as the "American system."[2] The tariffs of duties on imports were to be carried as high as revenue results would justify; within this limit the duties were to be defined for purposes of protection; and the superabundant revenues were to be expended on enterprises which would tend to aid the people in their efforts to subdue the continent. Protection was now to be for national benefit, not for the benefit of classes. Western farmers were to have manufacturing towns at their doors, as markets for the surplus which had hitherto been rotting on their farms; competition among manufacturers was to keep down prices; migration to all the new advantages of the West was to be made easy at national expense; and Henry Clay's eloquence was to commend the whole policy to the people. The old Democracy, particularly in the South, insisted that the whole scheme really had its basis in benefits to classes, that its communistic features were not such as the Constitution meant to cover by its grant of power to Congress to levy taxation for the general welfare, and that any such legislation would be unconstitutional. The dissatisfaction in the South rose higher when the tariffs were increased in 1824 and 1828. The proportion of customs revenue to dutiable imports rose to 37% in 1825 and to 44% in 1829; and the ratio to aggregate imports to 33% in 1825 and 37% in 1829. As yet, Southern dissatisfaction showed itself only in resolutions of state legislatures.

Erie Canal.

The "American System."

Tariffs of 1824 and 1828.

155. In the sudden development of the new nation circumstances had conspired to give social forces an abnormally materialistic cast, and this had strongly influenced the expression of the national life. Its literature and its art had amounted to little, for the American people were still engaged in the fiercest of warfare against natural difficulties, which absorbed all their energies.

156. In international relations the action of the government was strong, quiet and self-respecting. Its first weighty action took place in 1823. It had become pretty evident that the Holy Alliance, in addition to its interventions in Europe to suppress popular risings, meant to aid Spain in bringing her revolted South American colonies to obedience. Great Britain had been drifting steadily away from the alliance, and George Canning, the new secretary, determined to call in the weight of the transatlantic power as a check upon it. A hint to the American minister was followed by a few pregnant passages in Monroe's annual message in December. "We could not view," he said, "any interposition for the purpose of oppressing them [the South American states], or controlling in any other manner their destiny by any European power, in any other light than as the manifestation of an unfriendly disposition towards the United States." If both the United States and Great Britain were to take this ground the fate of a fleet sent by the Alliance across the Atlantic was not in much doubt, and the project was at once given up.

The Monroe Doctrine.

157. It was supposed at the time that Spain might transfer her colonial claims to some stronger power; and Monroe therefore said that "the American continents, by the free and independent condition which they have assumed and maintained, are henceforth not to be considered as subjects for future colonization by any European powers." This declaration and that quoted above constitute together the "Monroe doctrine" as originally proclaimed. The doctrine has remained the rule of foreign intercourse for all American parties. Added to the already established refusal of the United States to become entangled in any European wars or alliances, it has separated Europe and America to their common advantage. (See MONROE DOCTRINE.)

158. By a treaty with Russia (1825) that power gave up all claims on the Pacific coast south of the present limits of Alaska. The northern boundary of the United States had been defined by the treaty of 1783; and, after the acquisition of Louisiana, a convention with Great Britain (1818) settled the boundary on the line of 49° N. lat. as far west as the Rocky Mountains. West of these mountains the so-called Oregon country, on whose limits the two powers could not agree, was to be held in common possession for ten years. This common possession was prolonged by another convention (1827) indefinitely, with the privilege to either power to terminate it, on giving twelve months' notice. This arrangement lasted until 1846 (see OREGON: *History*).

The North-west Boundary.

159. Monroe's term of office came to an end in March 1825. He had originally been an extreme Democrat, who could hardly speak of Washington with patience; he had slowly modified his views, and his tendencies were now eagerly claimed by

[1] In 1816 Monroe received 183 electoral votes and his opponent, Rufus King, 34; in 1820 Monroe received 231 and his opponent, John Quincy Adams, 1.

[2] For a generation the making of "internal improvements" by the Federal government was an issue of great political importance. In 1806 Congress made an appropriation for the National or Cumberland Road, eventually constructed from Fort Cumberland, Md., to Vandalia, Ill. The policy of making such improvements was opposed on the ground that the Constitution gave to the Federal government no power to make them, that it was not an "enumerated power," and that such improvements were not a "necessary and proper" means of carrying out any of the enumerated powers. Others argued that the Federal government might constitutionally make such improvements, but could not exercise jurisdiction over them when made.

the few remaining Federalists as identical with their own. The nationalizing faction of the dominant party had scored almost all the successes of the administration, and the divergence between it and the opposing faction was steadily becoming more apparent. All the candidates for the presidency in 1824—Andrew Jackson, a private citizen of Tennessee; William H. Crawford, Monroe's secretary of the treasury; John Quincy Adams, his secretary of state; and Henry Clay, the speaker of the House of Representatives—claimed to be Republicans alike; but the personal nature of the struggle was shown by the tendency of their supporters to call themselves "Adams men" or "Jackson men," rather than by any real party title. Calhoun was supported by all groups for the vice-presidency, and was elected without difficulty. The choice of a president was more doubtful.

Election of 1824.

160. None of the four candidates had anything like a party organization behind him. Adams and Clay represented the nationalizing element, as Crawford and Jackson did not; but there the likeness among them stopped. The strongest forces behind Adams were the new manufacturing and commercial interests of the East; behind Clay were the desires of the West for internal improvements at Federal expense as a set-off to the benefits which the seaboard states had already received from the government; and the two elements were soon to be united into the National Republican or Whig party (*q.v.*). Crawford was the representative of the old Democratic party, with all its Southern influences and leanings. Jackson was the personification of the new democracy—not very cultured, perhaps, but honest, and hating every shade of class control instinctively. As he became better known the whole force of the new drift of things turned in his direction. Crawford was taken out of the race, just after the electors had cast their votes, by physical failure, and Adams, later, by the revival of ancient quarrels with the Federalists of New England; and the future was to be with Clay or with Jackson. But in 1824 the electors gave no one a majority; and the House of Representatives, voting by states, gave the presidency to Adams.

Party Divergence.

161. Adams's election in 1825 was due to the fact that Clay's friends in the House—unable to vote for him, as he was the lowest in the electoral vote, and only three names were open to choice in the House—very naturally gave their votes to Adams. As Adams appointed Clay to the leading position in his cabinet, the defeated party at once raised the cry of "bargain and intrigue," one of the most effective in a democracy, and it was kept up throughout Adams's four years of office. Jackson had received the largest number of electoral votes, though not a majority,[1] and the hazy notion that he had been injured because of his devotion to the people increased his popularity. Though demagogues made use of it for selfish purposes, this feeling was an honest one, and Adams had nothing to oppose to it. He tried vigorously to uphold the "American system," and succeeded in passing the tariff of 1828; he tried to maintain the influence of the United States on both the American continents; but he remained as unpopular as his rival grew popular. In 1828 Adams was easily displaced by Jackson, the electoral vote being 178 to 83. Calhoun was re-elected vice-president.

The Adams Administration 1825–29.

162. Jackson's inauguration in 1829 closes this period, as it ends the time during which a disruption of the Union by the peaceable withdrawal of any state was even possible. The party which had made state sovereignty its bulwark in 1798 was now in control of the government again; but Jackson's proclamation in his first term, in which he warned South Carolina that "disunion by armed force is treason," and that blood must flow if the laws were resisted, speaks a very different tone from the speculations of Jefferson on possible future divisions of the United States. And even the sudden attempt of South Carolina to exercise independent action (§§ 172-173) shows that some interest dependent upon state sovereignty had taken alarm at the drift of events, and was anxious to lodge a claim to the right before it should slip from its fingers for ever. Nullification was only the first skirmish between the two hostile forces of slavery and democracy.

Election of 1828. Democracy and Nationality.

163. When the vast territory of Louisiana was acquired in 1803 the new owner found slavery already established there by custom recognized by French and Spanish law. Congress tacitly ratified existing law by taking no action; slavery continued legal, and spread further through the territory; and the state of Louisiana entered as a slave state in 1812. The next state to be carved out of the territory was Missouri, admitted in 1821. A Territory, on applying for admission as a state, brings a constitution for inspection by Congress; and when it was found that the new state of Missouri proposed to recognize and continue slavery, a vigorous opposition spread through the North and West, and carried most of the senators and representatives from those sections with it. In the House of Representatives these two sections had a greatly superior number of members; but, as the number of Northern and Southern states had been kept about equal, the compact Southern vote, with one or two Northern allies, generally retained control of the Senate. Admitted by the Senate and rejected by the House, Missouri's application hung suspended for two years until it was successful by the admission of Maine, a balancing Northern state,[2] and by the following arrangement, known as the Missouri Compromise of 1820: Missouri was to enter as a slave state; slavery was for ever prohibited throughout the rest of the Louisiana Purchase north of lat. 36° 30′, the main southern boundary of Missouri; and, though nothing was said of the territory south of the compromise line, it was understood that any state formed out of it was to be a slave state, if it so wished (see MISSOURI COMPROMISE and MISSOURI, § *History*). Arkansas entered under this provision in 1836.

Slavery.

The Missouri Compromise.

164. The question of slavery was thus set at rest for the present, though a few agitators were roused to more zealous opposition to the essence of slavery itself. In the next decade these agitators succeeded only in the conversion of a few recruits, but these recruits were the ones who took up the work at the opening of the next period and never gave it up until slavery was ended. It is plain now, however, that North and South had already drifted so far apart as to form two sections, and it became evident during the next forty years that the wants and desires of these two sections were so divergent that it was impossible for one government to make satisfactory laws for both. The chief cause was not removed in 1820, though one of its effects was got out of the way for the time.

Sectional Divergence.

165. The vast flood of human beings which had been pouring westward for years had now pretty well occupied the territory east of the Mississippi, while, on the west side of that stream, it still showed a disposition to hold to the river valleys. The settled area had increased from 240,000 sq. m. in 1790 to 633,000 sq. m. in 1830, with an average of 20·3 persons to the square mile. There was still a great deal of Indian territory in the Southern states of Georgia, Alabama, Mississippi, and Florida, for the Southern Indians were among the finest of their race; they had become semi-civilized, and were formidable antagonists to the encroaching white race. The states interested had begun preparations for their forcible removal, in public defiance (see GEORGIA: *History*) of the attempts of the Federal government to protect the Indians (1827); but the removal was not completed until 1835. In the North, Wisconsin and Michigan, with the northern halves of Illinois and Indiana, were still very thinly settled, but everything indicated early increase of population. The first lake steamboat, the "Walk-in-the-Water," had appeared at Detroit in 1818, and the opening of the Erie Canal in 1825 added to the number

The Settled Area.

[1] Jackson received 99, Adams 84, Crawford 41, and Clay 37; in the House of Representatives Adams received the votes of 13 states, Jackson of 7, and Crawford of 4. For vice-president Calhoun received 182 electoral votes, and his principal competitors, Nathan Sanford, of New York, and Nathaniel Macon, of North Carolina, received 30 and 24 respectively.

[2] A prompt admission of Missouri would have balanced the slave and free states, but Alabama's admission as a slave state balanced them in 1819.

of such vessels. Lake Erie had seven in 1826; and in 1830, while the only important lake town, Detroit, was hardly yet more than a frontier fort, a daily line of steamers was running to it from Buffalo, carrying the increasing stream of emigrants to the western territory.

The Steamboat.

166. The land system of the United States had much to do with the early development of the West. From the first settlement, the universally recognized rule had been that of absolute individual property in land, with its corollary of unrestricted competitive or "rack" rents; and this rule was accepted fully in the national land system, whose basis was reported by Jefferson, as chairman of a committee of the Confederation Congress (1785). The public lands were to be divided into "hundreds" each ten miles square and containing one hundred mile-square plots. The hundred was called a "township," and was afterwards reduced to six miles square, of thirty-six mile-square plots of 640 acres each. From time to time principal meridians and east and west base lines have been run, and townships have been determined by their relations to these lines. The sections (plots) have been subdivided, but the transfer describes each parcel from the survey map, as in the case of "the south-west quarter of section 20, township 30, north, range 1 east of the third principal meridian." The price fixed in 1790 as a minimum was $2 per acre; it has tended to decrease, and no effort has ever been made to gain a revenue from it. When the nation acquired its western territory it secured its title to the soil, and always made it a fundamental condition of the admission of a new state that it should not tax United States lands. To compensate the new states for the freedom of unsold public lands from taxation, one township in each thirty-six was reserved to them for educational purposes; and the excellent public school systems of the Western states have been founded on this provision. The cost of obtaining a quarter section (160 acres), under the still later homestead system of granting lands to actual settlers, has come to be only about $26; the interest on this, at 6%, represents an annual rent of one cent per acre—making this, says F. A. Walker, as nearly as possible the "no-rent land" of the economists.

The Land System.

167. The bulk of the early westward migration was of home production; the great immigration from Europe did not begin until about 1847. The West as well as the East thus had its institutions fixed before being called upon to absorb an enormous foreign element.

I.—*Industrial Development and Sectional Divergence, 1829–1850.*

168. The eight years 1829–1837 have been called "the reign of Andrew Jackson"; his popularity, his long struggle for the presidency, and his feeling of his official ownership of the subordinate offices gave to his administration at least an appearance of Caesarism. But it was a strictly constitutional Caesarism; the restraints of written law were never violated, though the methods adopted within the law were new to national politics. Since about 1800 state politics in New York and Pennsylvania had been noted for the systematic use of the offices and for the merciless manner in which the office-holder was compelled to work for the party which kept him in place. The presence of New York and Pennsylvania politicians in Jackson's cabinet taught him to use the same system. Removals, except for cause, had been relatively rare before; but under Jackson men were removed almost exclusively for the purpose of installing some more serviceable party tool; and a clean sweep was made in the civil service. Other parties adopted the system, and it remained the rule at a change of administration until comparatively recent years.

New Political Methods.

169. The system brought with it a semi-military reorganization of parties. Hitherto nominations for the more important offices had been made mainly by legislative caucuses; candidates for president and vice-president were nominated by caucuses of congressmen, and candidates for the higher state offices by caucuses of the state legislatures. Late in the preceding period "conventions" of delegates from the members of the party in the state were held in New York and Pennsylvania; and in 1831–1832 this became the rule for presidential nominations. It rapidly developed into systematic state, county, and city "conventions"; and the result was the appearance of that complete political machinery, the American political party, with its local organizations, and its delegates to county, state and national conventions. The Democratic machinery was the first to appear, in Jackson's second term (1833–1837). Its workers were paid in offices, or hopes of office, so that it was said to be built on the "cohesive power of public plunder"; but its success was immediate and brilliant. The opposing party, the Whig party (*q.v.*), had no chance of victory in 1836; and its complete overthrow drove its leaders into the organization of a similar machinery of their own, which scored its first success in 1840. Since that time these strange bodies, unknown to the law, have governed the country by turns; and their enormous growth has steadily made the organization of a third piece of such machinery more difficult or hopeless.

The New Organization of Parties.

170. The Bank of the United States had hardly been heard of in politics until the new Democratic organization came into hostile contact with it. A semi-official demand upon it for a political appointment was met by a refusal; and the party managers called Jackson's attention to an institution which he could not but dislike the more he considered it. His first message spoke of it in unfriendly terms, and every succeeding message brought a more open attack. The old party of Adams and Clay had by this time taken the name of Whigs, probably from the notion that they were struggling against "the reign of Andrew Jackson," and they adopted the cause of the bank with eagerness. The bank charter did not expire until 1836, but in 1832 Clay brought up a bill for a new charter. It was passed and vetoed; and the Whigs made the veto an important issue of the presidential election of that year. They were beaten; Jackson was re-elected, receiving 219 electoral votes, and Clay, his Whig opponent, only 49, and the bank party could never again get a majority in the House of Representatives for the charter. The insistence of the president on the point that the charter was a "monopoly" bore weight with the people. But the president could not obtain a majority in the Senate. He determined to take a step which would give him an initiative, and which his opponents could not induce both houses to unite in overriding or punishing. Taking advantage of the provision that the secretary of the treasury might order the public funds to be deposited elsewhere than in the bank or its branches, he directed the secretary to deposit *all* the public funds elsewhere. Thus deprived of its great source of dividends, the bank fell into difficulties, became a state bank after 1836, and then went into bankruptcy. (See BANKS AND BANKING: *United States*; and JACKSON, ANDREW.)

Bank of the United States.

The Whig Party.

Removal of the Deposits.

171. All the political conflicts of Jackson's terms of office were close and bitter. Loose in his ideas before 1829, Jackson showed a steady tendency to adopt the strictest construction of the powers of the Federal government, except in such official perquisites as the offices. He grew into strong opposition to all traces of the "American system," and vetoed bills for internal improvements unsparingly; and his feeling of dislike to all forms of protection is as evident, though he took more care not to make it too public. There are many reasons for believing that his drift was the work of a strong school of leaders—Martin Van Buren, Thomas H. Benton, Edward Livingston, Roger B. Taney, Levi Woodbury, Lewis Cass, W. L. Marcy and others—who developed the policy of the party, and controlled it until the great changes of parties about 1850 took their power from them. At all events, some persistent influence made the Democratic party of 1830–1850 the most consistent and successful party which had thus far appeared in the United States.

Opposition to the "American System."

172. Calhoun (*q.v.*) and Jackson were of the same stock—Scottish-Irish—much alike in appearance and characteristics, the former representing the trained and educated logic of the race, the latter its instincts and passions. Jackson was led to break off his friendly relations with

Calhoun and Jackson.

Calhoun in 1830, and he had been led to do so more easily because of the appearance of the doctrine of nullification (*q.v.*), which was generally attributed, correctly enough, to the authorship of Calhoun. Asserting, as the Republican party of 1798 had done, the sovereign powers of each state, Calhoun held that, as a means of avoiding secession and violent struggle upon every occasion of the passage of an act of Congress which should seem unconstitutional to any state, the state might properly suspend or "nullify" the operation of the law within its jurisdiction, in order to protect its citizens against oppression. The passage of the Tariff Act of 1832, which organized and systematized the protective system, forced the Calhoun party into action. A state convention in South Carolina (*q.v.*) on the 24th of November 1832 declared the Tariff Act null, and made ready to enforce the declaration.

Nullification.

173. But the time was past when the power of a single state could withdraw it from the Union. The president issued a proclamation, warning the people of South Carolina against any attempt to carry out the ordinance of nullification; he ordered a naval force to take possession of Charleston harbour to collect the duties under the act; he called upon Congress for additional executive powers, and Congress passed what nullifiers called the "bloody bill," putting the land and naval forces at the disposal of the president for the collection of duties against "unlawful combinations"; and he is said to have announced, privately and profanely, his intention of making Calhoun the first victim of any open conflict. Affairs looked so threatening that an unofficial meeting of "leading nullifiers" agreed to suspend the operation of the ordinance until Congress should adjourn; whence it derived the right to suspend has never been stated.

174. The president had already asked Congress to reduce the duties; and many Democratic members of Congress, who had yielded to the popular clamour for protection, were very glad to use "the crisis" as an excuse for now voting against it. A compromise Tariff Act, scaling down all duties over 20% by one-tenth of the excess every two years until 1842, when the remaining excess over 20% should be dropped, was introduced by Clay and became law. Calhoun and his followers claimed this as all that the nullification ordinance had aimed at; and the ordinance was formally repealed. But nullification had received its death-blow; even those Southern leaders who maintained the right of secession refused to recognize the right of a state to remain in the Union while nullifying its laws; and, when protection was reintroduced by the tariff of 1842, nullification was hardly thought of.

Tariff of 1833.

175. All the internal conditions of the United States were completely altered by the introduction of railways. For twenty years past the Americans had been pushing in every direction which offered a hope of the means of reconciling vast territory with enormous population. Stephenson's invention of the locomotive came just in time, and Jackson's two terms of office marked the outburst of modern American life. The miles of railway were 23 in 1830, 1098 in 1835, some 2800 in 1840, and thereafter they about doubled every five years until 1860.

The Locomotive.

176. A railway map of 1840 shows a fragmentary system, designed mainly to fill the gaps left by the means of communication in use in 1830. One or two short lines run back into the country from Savannah and Charleston; another runs north along the coast from Wilmington to Baltimore; several lines connect New York with Washington and other points; and short lines elsewhere mark the openings which needed to be filled at once—a number in New England and the Middle states, three in Ohio and Michigan, and three in Louisiana. Year after year new inventions came in to increase and aid this development. The anthracite coal of the Middle states had been known since 1790, but no means had been devised to put the refractory agent to work. It was now successfully applied to railways (1836), and to the manufacture of iron (1837). Hitherto wood had been the best fuel for iron-making; now the states which relied on wood were driven out of competition, and production was restricted to the states in which nature had placed coal alongside of iron. Steam navigation across the Atlantic was established in 1838. The telegraph came next, S. F. B. Morse's line being erected in 1844. The spread of the railway system brought with it, as a natural development, the rise of the American system of express companies, whose first phases of individual enterprise appeared in 1839. No similar period in American history is so extraordinary for material development as the decade 1830–1840. At its beginning the country was an overgrown type of colonial life; at its end American life had been shifted to entirely new lines, which it has since followed. Modern American history had burst in with the explosiveness of an Arctic summer.

Railways of 1840.

Anthracite.

Iron.

Ocean Navigation. The Telegraph.

177. The steamboat had aided Western development, but the railway aided it far more. Cities and states grew as if the oxygen of their surroundings had been suddenly increased. The steamboat influenced the railway, and the railway gave the steamboat new powers. Vacant places in the states east of the Mississippi were filling up; the long lines of emigrant waggons gave way to the new and better methods of transport; and new grades of land were made accessible. Chicago was but a frontier fort in 1832; within a half-dozen years it was a flourishing town, with eight steamers connecting it with Buffalo, and dawning ideas of its future development of railway connexions. The maps change from decade to decade, as mapmakers hasten to insert new cities which have sprung up. Two new states, Arkansas and Michigan, were admitted (1836 and 1837). The population of Ohio grew from 900,000 to 1,500,000, that of Michigan from 32,000 to 212,000, and that of the country from 13,000,000 to 17,000,000, between 1830 and 1840.

Western Settlement.

Admission of Arkansas and Michigan.

178. With the change of material surroundings and possibilities came a steady amelioration of social conditions and a development of social ideals. Such features of the past as imprisonment for debt and the cruel indifference of old methods of dealing with crime began to disappear; the time was past when a state could use an abandoned copper mine as its state prison, as Connecticut had formerly done (see SIMSBURY, Connecticut). The domestic use of gas and anthracite coal, the introduction of expensive aqueducts for pure water, and the changing life of the people forced changes in the interior and exterior of American dwellings. Wood was still the common building material; imitations of Greek architecture still retained their vogue; but the interiors were models of comfort in comparison with the houses even of 1810. In the "new" regions this was not yet the case, and here social restraints were still so few that society seemed to be reduced almost to its primitive elements. Western steamers reeked with gambling, swindling, duelling and every variety of vice. Public law was almost suspended in some regions; and organized associations of counterfeiters and horse-thieves terrorized whole sections of country. But this state of affairs was altogether temporary, as well as limited in its area; the older and more densely settled states had been well prepared for the change and had never lost command of the social forces, and the process of settling down went on, even in the newer states, with far more rapidity than could reasonably have been expected. Those who took part in the movements of population in 1830–1840 had been trained under the rigid forms of the previous American life; and these soon re-asserted themselves. The rebound was over before 1847, and the Western states were then as well prepared to receive and digest the great immigration which followed as the older states would have been in 1830.

Social Conditions.

179. A distinct American literature dates from this period. Most of the publications in the United States were still cheap reprints of foreign works; but native productions no longer followed foreign models with servility. Between 1830 and 1840 Whittier, Longfellow, Holmes, Poe, Hawthorne, Emerson, Bancroft and Prescott joined the advance-guard of American writers—Bryant, Dana, Halleck, Drake,

Literature.

Irving and Cooper; and even those writers who had already made their place in literature showed the influence of new conditions by their growing tendency to look less to foreign models and methods. (See AMERICAN LITERATURE.) Popular education was improved. The new states had from the first endeavoured to secure the best possible system of common schools. The attempt came naturally from the political instincts of the class from which the migration came; but the system which resulted was to be of incalculable service during the years to come. Their absolute democracy and their universal use of the English language have made the common schools most successful machines for converting the raw material of immigration into American citizens. This supreme benefit is the basis of the system and the reason for its existence and development, but its incidental advantage of educating the people has been beyond calculation. It was an odd symptom of the general change that American newspapers took a new form during these ten years. The old "blanket-sheet" newspaper, cumbrous to handle and slow in all its ways, met its first rival in the type of newspaper which appeared first in New York City, in the *Sun*, the *Herald* and the *Tribune* (1833, 1835 and 1841). Swift and energetic in gathering news, and fearless, sometimes reckless, in stating it, they brought into American life, with very much that is evil, a great preponderance of good.

Common School System.

Newspapers.

180. The chaos into which a part of American society had been thrown had a marked effect on the financial institutions of the country, which went to pieces before it for a time. It had not been meant to make the public lands of the United States a source of revenue so much as a source of development. The sales had touched their high-water mark during the speculative year 1819, when receipts from them had amounted to $3,274,000; in other years they seldom went above $2,000,000. When the railway set the stream of migration moving faster than ever, and cities began to grow like mushrooms, it was natural that speculation in land should feel the effects. Sales rose to $3,200,000 in 1831, to $4,000,000 in 1833, to $5,000,000 in 1834, to $15,000,000 in 1835, and to $25,000,000 in 1836. In 1835 the president announced to Congress that the public debt was extinguished, and that some way of dealing with the surplus should be found. Calhoun's proposal, that after the year 1836 any surplus in excess of $5,000,000 should be divided among the states as a loan, was adopted, as regards the surplus (almost $37,000,000) of that year; and some $28,000,000—still carried on the books of the treasury as unavailable funds—were actually distributed before the crisis of 1837 put an end to the surplus and to the policy. The states had already taken a hand in the general speculation by beginning works of public improvement. Foreign, particularly English, capital was abundant; and states which had been accustomed to think a dozen times over a tax of a hundred thousand dollars now began to negotiate loans of millions of dollars and to appropriate the proceeds to the digging of canals and the construction of railways. Their enterprises were badly conceived and badly managed, and only added to the confusion when the crash came. If the Federal government and the states felt that they were rich, the imaginations of individuals ran riot. Every one wanted to buy; prices rose, and every one was growing richer on paper. The assessed value of real estate in New York City in 1832 was $104,000,000; in 1836 it had grown to $253,000,000. In Mobile the assessed value rose from $1,000,000 to $27,000,000. Fictitious values were the rule.

Land Sales.

Speculation.

181. When Jackson in 1833 ordered the government revenues to be deposited elsewhere than in the Bank of the United States, there was no government agent to receive them. The secretary of the treasury selected banks at various points in which the revenue should be deposited by the collecting officers; but these banks were organized under charters from their states, as were all banks except that of the United States. The theory of the dominant party denied the constitutional power of Congress to charter a bank, and the states had not yet learned how to deal with such institutions. Their grants of bank charters had been based on ignorance, intrigue, favouritism or corruption, and the banks were utterly unregulated. The Democratic feeling was that the privilege of forming banking corporations should be open to all citizens, and it soon became so. Moreover, it was not until after the crash that New York began the system of compelling such deposits as would really secure circulation, which was long afterward further developed into the present national bank system. In most of the states banks could be freely organized with or without tangible capital, and their notes could be sent to the West for the purchase of government lands, which needed to be held but a month or two to gain a handsome profit. (See BANKS AND BANKING: *United States*.) "Wild-cat banks" sprang up all over the country; and the "pet banks," as those chosen for the deposit of government revenues were called, went into speculation as eagerly as the banks which hardly pretended to have capital.

Corporations.

182. The Democratic theory denied the power of Congress to make anything but gold or silver coin legal tender. There have been "paper-money heresies" in the party; but there was none such among the new school of Democratic leaders which came in in 1829; they were "hard-money men." In July 1836 Jackson's secretary of the treasury ordered land agents to take nothing in payment for lands except gold or silver. In the following spring the full effects of the order became evident; they fell on the administration of Van Buren, Jackson's successor.[1] Van Buren had been Jackson's secretary of state, the representative man of the new Democratic school, and, in the opinion of the opposition, the evil genius of the Jackson administration; and it seemed to the Whigs poetic justice that he should bear the weight of his predecessor's errors. The "specie circular" turned the tide of paper back to the East, and when it was presented for payment most of the banks suspended specie payment with hardly a struggle. There was no longer a thought of buying; every one wanted to sell; and prices ran down with a rapidity even more startling than that with which they had risen. Failures, to an extent and on a scale unprecedented in the United States, made up the "panic of 1837." Many of the states had left their bonds in the hands of their agents, and, on the failure of the latter, found that the bonds had been hypothecated or disposed of, so that the states got no return from them except a debt which was to them enormous. Saddled suddenly with such a burden, and unable even to pay interest, some of the states "repudiated" their obligations; and repudiation was made successful by the fact that a state could not be sued by its creditors except by its own consent. Even the Federal government felt the strain, for its revenues were locked up in suspended banks. A little more than a year after Congress had authorized the distribution of its surplus revenues among the states Van Buren was forced to call it into special session to provide some relief for the government itself.

The "Specie Circular."

Panic of 1837.

Repudiation.

183. Van Buren held manfully to the strictest construction of the powers of the Federal government. He insisted that the panic would best right itself without government interference, and, after a four years' struggle, he succeeded in making the "sub-treasury scheme" law (1840). It cut off all connexion of the government with banks, putting collecting and disbursing officers under bonds to hold money safely and to transfer it under orders from the treasury, and restricting payments to or by the United States to gold and silver coin. Its passage had been preceded by another commercial crisis (1839), more limited in its field, but more discouraging to the people. It is true that Jackson, in dealing with the finances, had "simply smashed things," leaving his successor to repair damages; but it is far from certain that this was not the best way available at the time. The wisest scheme of financial reform would have had small chance

Sub-treasury Scheme.

[1] In the election of 1836 Van Buren received 170 electoral votes, W. H. Harrison (Whig) 73, Hugh L. White 26, Daniel Webster 14 and W. P. Mangum 11.

of success with the land-jobbers in Congress, and Van Buren's firmness found the way out of the chaos.

184. Van Buren's firmness was unpopular, and the Whig party now adopted methods which were popular if somewhat demagogical. It nominated William H. Harrison in 1840; it contrasted his homely frontier virtues with Van Buren's "ostentatious indifference to the misfortunes of the people" and with the supposed luxury of his life in the White House; and, after the first of the modern "campaigns" of mass meetings and processions, Harrison was elected, receiving 234 electoral votes and Van Buren only 60. He died on the 4th of April 1841, only a month after his inauguration, and the vice-president, John Tyler, became president. Tyler was of the extreme Calhoun school, which had shown some disposition to grant to Van Buren a support which it had refused to Jackson; and the Whigs had nominated Tyler to retain his faction with them. Now he was the nominal leader of the party, while his politics were opposite to theirs, and the real leader of the party, Clay, was ready to force a quarrel upon him. The quarrel took place; the Whig majority in Congress was not large enough to pass any measures over Tyler's veto; and the first two years of his administration were passed in barren conflict with his party. The "sub-treasury" law was repealed (1841); the tariff of 1842 introduced a modified protection; and there the Whigs were forced to stop. Their dissensions made Democratic success comparatively easy, and Tyler had the support of a Democratic House behind him during the last two years of his term.

Election of 1840.

Tariff of 1842.

185. The success of the Democratic machinery, and the reflex of its temporary check in 1840, with the influences brought to bear on it by the returning Calhoun faction, were such as to take the control of the party out of the hands of the leaders who had formed it. They had had high regard for political principle, even though they were willing to use doubtful methods for its propagation; these methods had now brought out new men, who looked mainly to success, and to close connexion with the controlling political element of the South as the easiest means of attaining success. When the Democratic convention of 1844 met it was expected to renominate Van Buren. A majority of the delegates had been sent there for that purpose, but many of them would have been glad to be prevented from doing so. They allowed a resolution to be passed making a two-thirds vote necessary for nomination; Van Buren was unable to command so many votes; and, when his name was withdrawn, James K. Polk was nominated. The Whigs nominated Clay.

186. The beginning of the abolitionist movement in the United States, the establishment of the *Liberator* (1831), and of the American Anti-Slavery Society (1833), and the subsequent divisions in it, are dealt with elsewhere (see Garrison, William Lloyd). Up to that time "abolition" had meant *gradual* abolition; it was a wish rather than a purpose. Garrison called for *immediate* abolition. The basis of the American system was in the reserved rights of the states, and slavery rested on their will, which was not likely to be changed. But the cry was kept up. The mission of the Abolitionists was to force the people to think of the question; and, in spite of riots, assaults and persecution of every kind, they fulfilled it manfully. In truth, slavery was more and more out of harmony with the new economic conditions which were taking complete control of the North and West, but had hardly been felt in the South. Thus the two sections, North and South, were more and more disposed to take opposite views of everything in which slavery was involved, and it had a faculty of involving itself in almost everything. The status of slavery in the Territories had been settled in 1820; that of slavery in the states had been settled by the Constitution; but even in minor questions the intrusive element had to be reckoned with. The Abolitionists sent their documents through the mails, and the South wished the Federal government to interfere and stop the practice. The Abolitionists persisted in petitioning Congress for the passage of various measures which Congress regarded as utterly unconstitutional; and the disposition of Congress to deny or regulate the right of petition in such matters (see Adams, John Quincy) excited the indignation of Northern men who had no sympathy with abolition. But the first occasion on which the views of the two sections came into flat contrast was on the question of the annexation of Texas.

Abolitionist Movement.

187. The United States had had a vague claim to Texas until 1819, when the claim was surrendered to Spain in part compensation for Florida. On the revolt of Mexico Texas became a part of that republic. It was colonized by Americans, mainly southerners and slave-holders, seceded from Mexico in 1835, and defeated the Mexican armies and established its independence in the following year. Southern politicians desired its annexation to the United States for many reasons. Its people were kindred to them; its soil would widen the area of slavery; and its territory, it was hoped, could be divided into several states, to reinforce the Southern column in the Senate. People in the North were either indifferent or hostile to the proposal; Van Buren had declared against it, and his action was a reason for his defeat in the Democratic convention. On the other hand, there were indications that the joint occupation of the Oregon country could not last much longer. American immigration into it had begun, while the Hudson's Bay Company, the British tenant of the soil, was the natural enemy of immigration. To carry the sentiment of both sections, the two points were coupled; and the Democratic convention declared for the reannexation of Texas and the reoccupation of Oregon.

Texas.

Oregon.

188. One of the cardinal methods of the political Abolitionists was to nominate candidates of their own against a doubtful friend, even though this secured the election of an open enemy. Clay's efforts to guard his condemnation of the Texas annexation project were just enough to push the Liberty party (*q.v.*), the political Abolitionists, into voting for candidates of their own in New York; on a close vote their loss was enough to throw the electoral votes of that state to Polk, and its votes decided the result. Polk was elected (November 1844);[1] and Texas was annexed to the United States in the following spring. At the next meeting of Congress (1845) Texas was admitted as a state.

Liberty Party.

Election of 1844.

Admission of Texas.

189. West of Texas the northern prolongation of Mexico ran right athwart the westward movement of American population; and, though the movement had not yet reached the barrier, the Polk administration desired further acquisitions from Mexico. The western boundary of Texas was undefined; a strip of territory claimed by Texas was settled exclusively by Mexicans; but the Polk administration directed General Zachary Taylor, the American commander in Texas, to cross the Nueces river and seize the disputed territory. Collisions with Mexican troops followed; they were beaten in the battles of Palo Alto and Resaca de la Palma, and were chased across the Rio Grande. Taylor followed and took the city of Monterey.

190. On the news of the first bloodshed Congress declared war against Mexico, over the opposition of the Whigs. A land and naval force took possession of California, and a land expedition occupied New Mexico, so that the authority of Mexico over all the soil north of her present boundaries was abruptly terminated (1846). At the opening of 1847 Taylor fought the last battle in northern Mexico (Buena Vista), defeating the Mexicans, and General Winfield Scott, with a new army, landed at Vera Cruz for a march upon the city of Mexico. Scott's march was marked by one successful battle after another, usually against heavy odds; and in September he took the capital city and held it until peace was made (1848) by the treaty of Guadalupe Hidalgo. Among the terms of peace was the cession of the present California, Utah, Arizona and New Mexico, the consideration being a payment of $15,000,000 by the United States and the assumption of some $3,000,000 of debts due by Mexico to American citizens. With a subsequent rectification of frontier (1853) by the Gadsden Treaty (see Gadsden, James), this cession

Peace.

[1] Polk received 170 electoral votes and Clay 105.

added some 500,000 sq. m. to the area of the United States; Texas itself made up a large additional area. The settlement of the north-east and north-west boundaries (see MAINE and OREGON) by the Webster-Ashburton and Buchanan-Pakenham treaties (1842, 1846) with the Texas and Mexican cessions, gave the United States the complete territorial form retained until the annexation of Alaska in 1867.

191. In the new territory slavery had been forbidden under Mexican law; and its annexation brought up the question of its status under American law. He who remembers the historical fact that slavery had never been more than a custom, ultimately recognized and protected by state law, will not have much difficulty in deciding about the propriety of forcing such a custom by law upon any part of a territory. But, if slavery was to be excluded from the new territory, the states which should ultimately be formed out of it would enter as free states, and the influence of the South in the Senate would be decreased. For the first time the South appears as a distinct *imperium in imperio* in the territorial difficulties which began in 1848.

Slavery in the New Territory.

192. The first appearance of these difficulties brought out in the Democratic party a solution which was so closely in line with the prejudices of the party, and apparently so likely to meet all the wishes of the South, that it bade fair to carry the party through the crisis without the loss of its Southern vote. This was "squatter sovereignty," the notion that it would be best for Congress to leave the people of each Territory to settle the question of the existence of slavery for themselves. The broader and democratic ground for the party would have been that which it at first seemed likely to take—the "Wilmot Proviso," a condition proposed to be added to the act authorizing acquisitions of territory, providing that slavery should be forbidden in all territory to be acquired under the act (see WILMOT, DAVID). In the end apparent expediency carried the dominant party off to "squatter sovereignty," and the Democratic adherents of the Wilmot Proviso, with the Liberty party and the anti-slavery Whigs, united in 1848 under the name of the Free Soil party (*q.v.*). The Whigs had no solution to offer; their entire programme, from this time to their downfall as a party, consisted in a persistent effort to evade or ignore all difficulties connected with slavery.

"Squatter Sovereignty."

Wilmot Proviso.

Free Soil Party.

193. Taylor, after the battle of Buena Vista, resigned and came home, considering himself ill-used by the administration. He refused to commit himself to any party; and the Whigs were forced to accept him as their candidate in 1848. The Democrats nominated Lewis Cass; and the Free Soil party, or "Free-Soilers," nominated Van Buren. By the vote of the last-named party the Democratic candidate lost New York and the election, and Taylor was elected president, receiving 163 electoral votes, while Cass received 127. Taking office in March 1849, he had on his shoulders the whole burden of the territorial difficulties, aggravated by the discovery of gold in California and the sudden rise of population there. Congress was so split into factions that it could for a long time agree upon nothing; thieves and outlaws were too strong for the semi-military government of California; and the Californians, with the approval of the president, proceeded to form a constitution and apply for admission as a state. They had so framed their constitution as to forbid slavery; and this was really the application of the Wilmot Proviso to the richest part of the new territory, and the South felt that it had been robbed of the cream of what it alone had fought cheerfully to obtain.

Election of 1848.

194. The admission of California was not secured until September 1850, soon after Taylor's sudden death (July 9), and then only by the addition of a bonus to Texas, the division of the rest of the Mexican cession into the Territories of Utah and New Mexico without prohibition of slavery, and the passage of a fugitive slave law. The slave trade, but not slavery, was forbidden in the District of Columbia. The whole was generally known as the Compromise Measures of 1850 (*q.v.*). Two of its features need notice. As has been said, slavery was not mentioned in the act; and the status of slavery in the Territories, was thus left uncertain. Congress can veto any legislation of a territorial legislature, but, in fact, the two houses of Congress were hardly ever able to unite on anything after 1850, and both these Territories did establish slavery before 1860, without a Congressional veto. The advantage here was with the South. The other point, the Fugitive Slave Law (*q.v.*), was a special demand of the South. The Constitution contained clauses directing that fugitive criminals and slaves should be delivered up, on requisition, by the state to which they had fled. In the case of criminals the delivery was directed to be made by the executive of the state to which they had fled; in the case of slaves no delivering authority was specified, and an act of Congress in 1793 had imposed the duty on Federal judges or on local state magistrates. Some of the states had passed "Personal Liberty Laws," forbidding or limiting the action of their magistrates in such cases, and the act of 1850 transferred the decision of such cases to United States commissioners, with the assistance of United States marshals. It imposed penalties on rescues, and denied a jury trial.

Admission of California.

Compromise of 1850.

Fugitive Slave Law.

Personal Liberty Laws.

195. The question of slavery had taken up so much time in Congress that its other legislation was comparatively limited. The rates of postage were reduced to five and ten cents for distances less and greater than 300 m. (1845); and the naval school at Annapolis was established in the same year. The military academy at West Point had been established as such in 1802. When the Democratic party had obtained complete control of the government, it re-established (by act of 6th August, 1846), the "sub-treasury," or independent treasury, which is still the basis of the treasury system. In the same year, after an exhaustive report by Robert J. Walker, Polk's secretary of the treasury, the tariff of 1846 was passed; it reduced duties, and moderated the application of the protective principle. Apart from a slight reduction of duties in 1857, this remained in force till 1861.

Tariff of 1846.

196. Five states were admitted during the last ten years of this period: Florida (1845), Texas (1845), Iowa (1846), Wisconsin (1848) and California (1850). The early entrance of Iowa, Wisconsin and Florida had been due largely to Indian wars—the Black Hawk War (see BLACK HAWK) in Iowa and Wisconsin (1832), and the Seminole War in Florida (1835–37), after each of which the defeated Indians were compelled to cede lands as the price of peace. The extinction of Indian titles in northern Michigan brought about the discovery of the great copper fields of that region, whose existence had been suspected long before it could be proved. Elsewhere settlement followed the lines already marked out, except in the new possessions on the Pacific coast, whose full possibilities were not yet known. Railways in the Eastern states were beginning to show something of a connected system; in the South they had hardly changed since 1840; in the West they had only been prolonged on their original lines. The telegraph was brought into use in 1844; but it is not until the census of 1860 that its effects are seen in the fully connected network of railways which then covers the whole North and West.

Admission of Florida, Iowa and Wisconsin.

Railways and Telegraphs.

197. The sudden development of wealth in the country gave an impetus to the spirit of invention. Charles Goodyear's method of vulcanizing rubber (1839) had come into use. Cyrus Hall M'Cormick had made an invention whose results have been hardly less than that of the locomotive in their importance to the United States. He had patented a reaping machine in 1834, and this, further improved and supplemented by other inventions, had brought into play the whole system of agricultural machinery, whose existence was scarcely known elsewhere until the London "World's Fair" of 1851 brought it into notice. A successful sewing-machine came in 1846; the power-loom and the surgical use of anaesthetics in the same year; and the rotary press for printing in 1847.

Invention.

198. All the conditions of life were changing so rapidly that it was natural that the minds of men should change with them or become unsettled. This was the era of new sects, of communities, of fantastic proposals of every kind, of transcendentalism in literature, religion, and politics. Not the most fantastic or benevolent, but certainly the most successful, of these was the sect of Mormons or Latter-day Saints. They settled in Utah in 1847, calling their capital Salt Lake City, and spreading thence through the neighbouring Territories. They became a menace to the American system; their numbers were so great that it was against American instincts to deprive them of self-government; while their polygamy and total submission to their hierarchy made it impossible to erect them into a state having complete control of marriage and divorce. The difficulty was lessened by their renunciation of polygamy in 1890 (see MORMONS).

The Mormons.

199. The material development of the United States since 1830 had been extraordinary, but every year made it more evident that the South was not sharing in it. It is plain now that the fault was in the labour system of the South: her only labourers were slaves, and a slave who was fit for anything better than field labour was prima facie a dangerous man. The divergence had as yet gone only far enough to awaken intelligent men in the South to its existence, and to stir them to efforts as hopeless as they were earnest, to find some artificial stimulus for Southern industries. In the next ten years the process was to show its effects on the national field.

The South.

J.—*Tendencies to Disunion, 1850–1861.*

200. The Abolitionists had never ceased to din the iniquity of slavery into the ears of the American people. Calhoun, Webster and Clay, with nearly all the other political leaders of 1850, had united in deploring the wickedness of these fanatics, who were persistently stirring up a question which was steadily widening the distance between the sections. They mistook the symptom for the disease. Slavery itself had put the South out of harmony with its surroundings. Even in 1850, though they hardly yet knew it, the two sections had drifted so far apart that they were practically two different countries.

Slavery and the Sections.

201. The South remained much as in 1790; while other parts of the country had developed, it had stood still. The remnants of colonial feeling, of class influence, which advancing democracy had wiped out elsewhere, retained all their force here, aggravated by the effects of an essentially aristocratic system of employment. The ruling class had to maintain a military control over the labouring class, and a class influence over the poorer whites. It had even secured in the Constitution provision for its political power in the representation given to three-fifths of the slaves. The twenty additional members of the House of Representatives were not simply a gain to the South; they were still more a gain to the "black districts," where whites were few, and the slave-holder controlled the district. Slave-owners and slave-holders together, there were but 350,000 of them; but they had common interests, the intelligence to see them, and the courage to contend for them. The first step of a rising man was to buy slaves; and this was enough to enrol him in the dominant class. From it were drawn the representatives and senators in Congress, the governors, and all the holders of offices over which the "slave power," as it came to be called, had control. Not only was the South inert; its ruling class, its ablest and best men, united in defence of tendencies hostile to those of the rest of the country.

The "Slave Power."

202. Immigration into the United States was not an important factor in its development until about 1847. The immigrants, so late as 1820, numbered but 8000 per annum; their number did not touch 100,000 until 1842, and then it fell for a year or two almost to half that number. In 1847 it rose again to 235,000, in 1849 to 300,000, and in 1850 to 428,000; all told, more than two and a quarter million persons from abroad settled in the United States between 1847 and 1854. Leaving out the dregs of the immigration, which settled down in the seaboard cities, its best part was a powerful nationalizing force. It had not come to any particular state, but to the United States; it had none of the traditional prejudices in favour of a state, but a strong feeling for the whole country; and the new feelings which it brought in must have had their weight not only on the gross mass of the people, but on the views of former leaders. And all the influences of this enormous immigration were confined to the North and West. The immigration avoided slave soil as if by instinct. So late as 1880 the census reported that the Southern states, except Florida, Louisiana and Texas, are "practically without any foreign element"; but it was only in 1850–1860 that this differentiating circumstance began to show itself plainly. And, as the sections began to differ further in aims and policy, the North began to gain heavily in ability to ensure its success.

Immigration.

203. Texas was the last slave state ever admitted; and, as it refused to be divided, the South had no further increase of numbers in the Senate. Until 1850 the admission of a free state had been so promptly balanced by the admission of a slave state that the senators of the two sections had remained about equal in number; in 1860 the free states had 36 senators and the slave states only 30. As the representation in the House had changed from 35 free state and 30 slave state members in 1790 to 147 free state and 90 slave state in 1860, and as the number of presidential electors is the sum of the numbers of senators and representatives, political power had passed away from the South in 1850. If at any time the free states should unite they could control the House of Representatives and the Senate, elect the president and vice-president, dictate the appointment of judges and other Federal officers, and make the laws what they pleased. If pressed to it, they could even control the interpretation of the laws by the Supreme Court. No Federal judge could be removed except by impeachment, but an act of Congress could at any time increase the number of judges to any extent, and the appointment of the additional judges could reverse the opinion of the court.

The Sections in Congress.

204. In circumstances so critical a cautious quiescence and avoidance of public attention was the only safe course for the "slave power," but that course had become impossible. The numbers interested had become too large to be subject to complete discipline; all could not be held in cautious reserve; and, when an advanced proposal came from any quarter of the slave-holding lines, the whole army was shortly forced up to the advanced position. Every movement of the mass was necessarily aggressive; and aggression meant final collision. If collision came it must be on some question of the rights of the states; and on such a question the whole South would move as one man.

Tendencies to Disunion.

205. The Protestant churches of the United States had reflected in their organization the spirit of the political institutions under which they lived. Acting as purely voluntary associations, they had been organized into governments by delegates, much like the "conventions" which had been evolved in the political parties. The omnipresent slavery question intruded into these bodies, and split them. The Methodist Episcopal Church was thus divided into a Northern and a Southern branch in 1844, and the equally powerful Baptist Church met the same fate in the following year. Two of the four great Protestant bodies were thus no longer national; it was only by the most careful management that the integrity of the Presbyterian Church was maintained until 1861, when it also yielded; and only the Episcopal and Roman Catholic Churches retained their national character.

Sectarian Division.

206. The political parties showed the same tendency. Each began to shrivel up in one section or the other. The notion of "squatter sovereignty," attractive at first to the Western democracy, and not repudiated by the South, enabled the Democratic party to pass the crisis of 1850 without losing much of its Northern vote, while Southern Whigs began to drift in, making the party continually

Party Changes.

more pro-slavery. This could not continue long without beginning to decrease its Northern vote, but this effect did not become plainly visible until after 1852. The efforts of the Whig party to ignore the great question alienated its anti-slavery members in the North, while they did not satisfy its Southern members. The Whig losses were not at first heavy, but, as the electoral vote of each state is determined by the barest plurality of the popular vote, they were enough to defeat the party almost everywhere in the presidential election of 1852. The Whigs nominated General Winfield Scott and the Democrats *Election of 1852.* Franklin Pierce; and Pierce carried all but four of the thirty-one states, and was elected, receiving 254 out of the 296 electoral votes. This revelation of hopeless weakness was the downfall of the Whig party; it maintained its organization for four years longer, but the life had gone out of it. The future was with the Free Soil party, though it had polled but few votes in 1852.

207. During the administration of Taylor (and Vice-President Millard Fillmore, who succeeded him) Clay, Webster, Calhoun, Polk and Taylor were removed by *Changes in Leadership.* death, and there was a steady drift of other political leaders out of public life. New men were pushing in everywhere, and in both sections they showed the prevailing tendency to disunion. The best of them were unprecedentedly radical. Charles Sumner, William H. Seward, and Salmon P. Chase came into the Senate, bringing the first accession of recognized force and ability to the anti-slavery feeling in that body. The new Southern men, such as Jefferson Davis, and the Democratic recruits from the Southern Whig party, such as Alexander H. Stephens, were ready to take the ground on which Calhoun had always insisted—that Congress was bound not merely to the negative duty of not attacking slavery in the Territories, but to the positive duty of protecting it. This, if it should become the general Southern position, was certain to destroy the notion of "squatter sovereignty," and thus to split the Democratic party, which was almost the last national ligament that now held the two fragments of the Union together.

208. The social disintegration was as rapid. Northern men travelling in the South were naturally looked upon with increasing suspicion, and were made to feel that they *Social Divergence.* were on a soil alien in sympathies. Some of the worst phases of democracy were called into play in the South; and, in some sections, law openly yielded supremacy to popular passion in the cases of suspected Abolitionists. Southern conventions, on all sorts of subjects, became common; and in these meetings, permeated by a dawning sense of Southern nationality, hardly any proposition looking to Southern independence of the North was met with disfavour.

209. Calhoun, in his last and greatest speech, called attention to the manner in which one tie after another was snapping. But he ignored the real peril of the situation—its *Progress of Disunion.* dangerous facts: that the South was steadily growing weaker in comparison with the North, and more unable to secure a wider area for the slave system; that it was therefore being steadily forced into demanding active Congressional protection for slavery in the Territories; that the North would never submit to this; and that the South must submit or bring about a collision by attempting to secede.

210. Anti-slavery feeling in the North was stimulated by the manner in which the Fugitive Slave Law was enforced immediately after 1850. The chase after fugitive *Fugitive Slave Law.* slaves was prosecuted in many cases with circumstances of revolting brutality, and features of the slave system which had been tacitly looked upon as fictitious were brought home to the heart of the free states. (See FUGITIVE SLAVE LAWS.) The added feeling showed its force when the Kansas-Nebraska Act was passed by Congress (1854). It organized the two new Territories of *Kansas-Nebraska Act.* Kansas and Nebraska. Both of them were for ever free soil by the terms of the Missouri Compromise (*q.v.*). But the success of the notion of squatter sovereignty in holding the Democratic party together while destroying the Whig party had intoxicated Stephen A. Douglas (*q.v.*), and other Northern Democrats; and they now applied the doctrine to these Territories. They did not desire "to vote slavery up or down," but left the decision to the people of the two Territories and the essential feature of the Missouri Compromise was specifically repealed.

211. This was the grossest political blunder in American history. The status of slavery had been settled, by the Constitution or by the compromises of 1820 and 1850, on every square foot of American soil; right or wrong, the settlement was made. The Kansas-Nebraska Act took a great mass of territory out of the settlement and flung it into the arena as a prize for which the sections were to struggle. The first result of the act was to throw parties into chaos. An American or "Know-Nothing" (*q.v.*) party, a secret oath-bound organization, pledged to oppose the influence or power of *The "American Party."* foreign-born citizens, had been formed to take the place of the defunct Whig party. It had been quite successful in state elections for a time, and was now beginning to have larger aspirations. It, like the Whig party, intended to ignore slavery, but, after a few years of life, the questions complicated with slavery entered its organization and divided it also. Even in 1854 many of its leaders in the North were forced to take position against the Kansas-Nebraska Act, while hosts of others joined in the opposition without any party organization. No American party ever rose so swiftly as this latter; with no other party name than the awkward title of "Anti-Nebraska men," it carried the *The Republican Party.* Congressional elections of 1854 at the North, forced many of the former Know-Nothing leaders into union with it, and controlled the House of Representatives of the Congress which met in 1855. The Democratic party, which had been practically the only party since 1852, had now to face the latest and strongest of its broad-constructionist opponents, one which with the nationalizing features of the Federalist and Whig parties combined democratic feelings and methods, and, above all, had a democratic purpose at bottom. It acknowledged, at first, no purpose aimed at slavery, only an intention to exclude slavery from the Territories; but, under such principles, it was the only party which was potentially an anti-slavery party, the only party to which the enslaved labourer of the South could look with the faintest hope of aid in reaching the status of a man. The new party had grasped the function which belonged of right to its great opponent, and it seized with it its opponent's original title. The name Democrat had quite taken the place of that first used—Republican—but the latter had never passed out of popular remembrance and liking at the North. The new party took quick and skilful advantage of this by assuming the old name (see REPUBLICAN PARTY), and early in 1856 the two great parties of the present—Democratic and Republican—were drawn up against one another.

212. The foreign relations of the United States during Pierce's term of office were overshadowed by the domestic difficulties, but were of importance. In the Koszta case (1853) national protection had been afforded *Koszta Case.* on foreign soil to a person who had only taken the preliminary steps to naturalization (see MARCY, W. L.). Japan had been opened to American intercourse and commerce (1854). But the question of slavery was more *Japan.* and more thrusting itself even into foreign relations. A great Southern republic, to be founded at first by the slave states, but to take in gradually the whole territory around the Gulf of Mexico and include the West Indies, was soon to be a pretty general ambition among slave-holders, and its first phases appeared during Pierce's administration. Efforts were begun to obtain Cuba from Spain; and the three leading American ministers abroad, meeting at Ostend, *Ostend Manifesto; Filibustering.* united in declaring the possession of Cuba to be essential to the well-being of the United States (1854). (See BUCHANAN, JAMES.) "Filibustering" expeditions against Cuba or the smaller South American states, intended so to revolutionize them as to lay a basis for an

application to be annexed to the United States, became common, and taxed the energies of the Federal government. But these yielded in importance to the affairs in Kansas.

213. Nebraska was then supposed to be a desert, and attention was directed almost exclusively to Kansas. No sooner had its organization left the matter of slavery to be decided by its "people" than the anti-slavery people of the North and West felt it to be their duty to see that the "people" of the Territory should be anti-slavery in sympathy. Emigrant associations were formed, and these shipped men and families to Kansas, arming them for their protection in the new country. Southern newspapers called for similar measures in the South, but the call was less effective. Southern men without slaves, settling a new state, were uncomfortably apt to prohibit slavery, as in California. Only slaveholders were trusty pro-slavery men; and such were not likely to take slaves to Kansas and risk their ownership on the result of the struggle. But for the people of Missouri, Kansas would have been free soil at once. Lying across the direct road to Kansas, the Missouri settlers blockaded the way of free-state settlers, crossed into Kansas, and voted profusely at the first Territorial election. The story of the contest between the free-state and pro-slavery settlers is told elsewhere (see KANSAS: § *History*); here it need only be said that the struggle passed into a real civil war, the two powers mustering considerable armies, fighting battles, capturing towns and paroling prisoners. The struggle was really over in 1857, and the South was beaten. There were, however, many obstacles yet to be overcome before the new state of Kansas was recognized by Congress, after the withdrawal of the senators of the seceding states (1861).

Kansas.

214. In the heat of the Kansas struggle came the presidential election of 1856. The Democrats nominated James Buchanan, declaring, as usual, for the strictest limitations of the powers of the Federal government on a number of points specified, and reaffirming the principle of the Kansas-Nebraska Act—the settlement of slavery by the people of a Territory. The remnant of the Whig party, including the Know-Nothings of the North and those Southern men who wished no further discussion of slavery, nominated the president who had gone out of office in 1853, Millard Fillmore. The Republican party nominated John C. Frémont; the bulk of its manifesto was taken up with protests against attempts to introduce slavery into the Territories; but it showed its broad-construction tendencies by declaring for appropriations of Federal moneys for internal improvements. The Democrats were successful in electing Buchanan;[1] but the position of the party was quite different from the triumph with which it had come out of the election of 1852. It was no longer master of twenty-seven of the thirty-one states; all New England and New York, all the North-West but Indiana and Illinois, all the free states but five, had gone against it; its candidate no longer had a majority of the popular vote. For the first time in the history of the country a distinctly anti-slavery candidate had obtained an electoral vote, and had even come near obtaining the presidency. Fillmore had carried but one state, Maryland; Buchanan had carried the rest of the South, with a few states in the North, and Frémont the rest of the North and none of the South. If things had gone so far that the two sections were to be constituted into opposing political parties, it was evident that the end was near.

Election of 1856.

215. Oddly enough the constitutionality of the Compromise of 1820 had never happened to come before the Supreme Court for consideration. In 1856–1857 it came up for the first time. One Dred Scott, a Missouri slave who had been taken in 1834 to Illinois, a free state, and in 1836 to Minnesota, within the territory covered by the Compromise, and had some years after being taken back to Missouri in 1838 sued for his freedom, was sold (1852) to a citizen of New York. Scott then transferred his suit from the state to the Federal courts, under the power given them to try suits between citizens of different states, and the case came by appeal to the Supreme Court. Its decision, announced on the 6th of March 1857, put Scott out of court on the ground that a slave, or the descendant of slaves, could not be a citizen of the United States or have any standing in Federal courts. The opinion of Chief Justice Taney went on to attack the validity of the Missouri Compromise, for the reasons that one of the Constitutional functions of Congress was the protection of property; that slaves had been recognized as property by the Constitution, and that Congress was bound to protect, not to prohibit, slavery in the Territories.[2] The mass of the Northern people held that slaves were looked upon by the Constitution, not as property, but as "persons held to service or labour" by state laws; that the Constitutional function of Congress was the protection of liberty as well as of property; and that Congress was thus bound to prohibit, not to protect, slavery in the Territories. A large part of the North flouted the decision of the Supreme Court, and the storm of angry dissent which it aroused did the disunionists good service at the South. From this time the leading newspapers in the South maintained that the radical Southern view first advanced by Calhoun, and but slowly accepted by other Southern leaders, as to the duty of Congress to protect slavery in the Territories, had been confirmed by the Supreme Court; that the Northern Republicans had rejected it; even the "squatter sovereignty" of Northern Democrats could no longer be submitted to by the South.

The Dred Scott Decision.

216. The population of the United States in 1860 was over 31,000,000, an increase of more than 8,000,000 in ten years. As the decennial increases of population became larger, so did the divergence of the sections in population, and still more in wealth and resources. Two more free states came in during this period—Minnesota (1858) and Oregon (1859)—and Kansas was clamouring loudly for the same privilege. The free and slave states, which had been almost equal in population in 1790, stood now as 19 to 12. And of the 12,000,000 in slave states, the 4,000,000 slaves and the 250,000 free blacks were not so much a factor of strength as a possible source of weakness and danger. No serious slave rising had ever taken place in the South; but John Brown's attack (1859) on Harper's Ferry as the first move in a project to rouse the slaves (see BROWN, JOHN), and the alarm which it carried through the South, were tokens of a danger which added a new horror to the chances of civil war. It was not wonderful that men, in the hope of finding some compromise by which to avoid such a catastrophe, should be willing to give up everything but principle, nor that offers of compromise should urge Southern leaders further into the fatal belief that "the North would not fight."

Admission of Minnesota and Oregon.

John Brown's Raid.

217. Northern Democrats, under the lead of Douglas, had been forced already almost to the point of revolt by the determination of Southern senators to prevent the admission of Kansas as a free state, if not to secure her admission as a slave state. When the Democratic convention of 1860 met at Charleston the last strand of the last national political organization parted; the Democratic party itself was split at last by the slavery question. The Southern delegates demanded a declaration in favour of the duty of Congress to protect slavery in the Territories. It was all that the Douglas Democrats could then do to maintain themselves in a few Northern states; such a declaration meant political suicide everywhere, and they voted it down. The convention divided into two bodies. The Southern body adjourned to Richmond, and the Northern and Border state convention to Baltimore. Here the Northern delegates, by seating some delegates friendly to Douglas,

Division of the Democratic Party.

[1] Buchanan received 174 electoral votes, Frémont 114 and Fillmore 8. The popular vote was: for Buchanan, 1,838,169; for Frémont, 1,341,264; for Fillmore, 874,534.

[2] In his decision Taney, referring to the period before the adoption of the Constitution, wrote: "They (negroes) had for more than a century before been regarded as beings of an inferior order, and altogether unfit to associate with the white race, either in social or political relations; and so far inferior that they had no rights which the white man was bound to respect." This was intended to be merely a historical statement, but it is often incorrectly quoted as if it referred to the status of the negro in 1857.

provoked a further secession of border state delegates, who, in company with the Richmond body, nominated John C. Breckinridge (*q.v.*) and Joseph Lane for president and vice-president. The remainder of the original convention nominated Douglas and H. V. Johnson.

218. The remnant of the old Whig and Know-Nothing parties, now calling itself the Constitutional Union party, met at Baltimore and nominated John Bell (*q.v.*) and Edward Everett. The Republican convention met at Chicago. Its "platform" of 1856 had been somewhat broad-constructionist in its nature and leanings, but a strong Democratic element in the party had prevented it from going too far in this direction. The election of 1856 had shown that, with the votes of Pennsylvania and Illinois, the party would have then been successful, and the Democratic element was now ready to take almost anything which would secure the votes of these states. This state of affairs will go to explain the nomination of Abraham Lincoln, of Illinois, for president, with Hannibal Hamlin, a former Democrat, for vice-president, and the declaration of the platform in favour of a protective tariff. The mass of the platform was still devoted to the necessity of excluding slavery from the Territories. To sum up: the Bell party wished to have no discussion of slavery; the Douglas Democrats rested on "squatter sovereignty" and the Compromise of 1850, but would accept the decision of the Supreme Court; the Republicans demanded that Congress should legislate for the prohibition of slavery in the Territories; and the Southern Democrats demanded that Congress should legislate for the protection of slavery in the Territories.

Constitutional Union Party; Republican Party.

The Parties and Slavery in the Territories.

219. No candidate received a majority of the popular vote, Lincoln standing first and Douglas second. But Lincoln and Hamlin had a clear majority of the electoral vote, and so were elected, Breckinridge and Lane coming next.[1] It is worthy of mention that, up to the last hours of Lincoln's first term of office, Congress would always have contained a majority opposed to him but for the absence of the members from the seceding states. The interests of the South and even of slavery were thus safe enough under an anti-slavery president. But the drift of events was too plain. Nullification had come and gone, and the nation feared it no longer. Even secession by a single state was now almost out of the question; the letters of Southern governors in 1860, in consultation on the state of affairs, agree that no state would secede without assurances of support by others. If this crisis were allowed to slip by without action, even a sectional secession would soon be impossible.

Election of 1860.

220. In October 1860 Governor W. H. Gist, of South Carolina, sent a letter to the governor of each of the other cotton states except Texas, asking co-operation in case South Carolina should resolve upon secession, and the replies were favourable. The democratic revolution which, since 1829, had compelled the legislature to give the choice of presidential electors to the people of the states had not affected South Carolina; her electors were still chosen by the legislature. That body, after having chosen the state's electors on the 6th of November, remained in session until the telegraph had brought assurances that Lincoln had secured a sufficient number of electors to ensure his election; it then (on the 10th) summoned a state convention and adjourned. The state convention, which is a legislative body chosen for a special purpose, met first at Columbia and then at Charleston, and on the 20th of December unanimously passed an "ordinance of secession," repealing the acts by which the state had ratified the Constitution and its amendments, and dissolving "the union now subsisting between South Carolina and other states, under the name of the 'United States of America.'" The convention took all steps necessary to prepare for war, and adjourned. Similar ordinances were passed by conventions in Mississippi (Jan. 9, 1861), Florida (Jan. 10), Alabama (Jan. 11), Georgia (Jan. 19), Louisiana (Jan. 26) and Texas (Feb. 1).

Secession.

221. The opposition in the South did not deny the right to secede, but the expediency of its exercise. Their effort was to elect delegates to the state conventions who would vote not to secede. They were beaten, says A. H. Stephens, by the cry, originally uttered by T. R. R. Cobb before his state legislature (Nov. 12, 1860), "we can make better terms out of the Union than in it." That is, the states were to withdraw individually, suspend the functions of the Federal government within their jurisdiction for the time, consider maturely any proposals for guarantees for their rights in the Union, and return as soon as satisfactory guarantees should be given. A second point to be noted is the difference between the notions of a state convention prevalent in the North and in the South. The Northern state convention was generally considered as a preliminary body, whose action was not complete or valid until ratified by a popular vote. The Southern state convention was looked upon as the incarnation of the sovereignty of the state, and its action was not supposed to need a popular ratification. When the conventions of the seceding states had adopted the ordinances of secession, they proceeded to other business. They appointed delegates, who met at Montgomery, the capital of Alabama, formed a provisional constitution (Feb. 8) for the "Confederate States," chose a provisional president and vice-president (Jefferson Davis and A. H. Stephens), and established an army, treasury, and other executive departments. The president and vice-president were inaugurated on the 18th of February. The permanent constitution, adopted on the 11th of March, was copied from that of the United States, with variations meant to maintain state sovereignty, to give the cabinet seats in Congress, and to prevent the grant of bounties or any protective features in the tariff or the maintenance of internal improvements at general expense; and it expressly provided that in all the territory belonging to the Confederacy but lying without the limits of the several states "the institution of negro slavery, as it now exists in the Confederate States, shall be recognized and protected by Congress and by the Territorial government" (see CONFEDERATE STATES OF AMERICA).

The Argument for Secession.

Action at the State Conventions.

The "Confederate States."

222. Under what claim of Constitutional right all this was done passes comprehension. That a state convention should have the final power of decision on the question which it was summoned to consider is quite as radical doctrine as has yet been heard of; that a state convention, summoned to consider the one question of secession, should go on, with no appeal to any further popular authority or mandate, to send delegates to meet those of other states and form a new national government, which could only exist by warring on the United States, is a novel feature in American Constitutional law. It was revolution or nothing. Only in Texas, where the call of the state convention was so irregular that a popular vote could hardly be escaped, was any popular vote allowed. Elsewhere the functions of the voter ceased when he voted for delegates to the state convention; he could only look on helplessly while that body went on to constitute him a citizen of a new nation.

Constitutional Rights.

223. The Border states were in two tiers—North Carolina, Tennessee and Arkansas next to the seceding states, and Delaware, Maryland, Virginia, Kentucky and Missouri next to the free states. None of these was willing to secede. There was, however, one force which might draw them into secession. A state which did not wish to secede, but believed in state sovereignty and the abstract right of secession, would be inclined to take up arms to resist any attempt by the Federal government to coerce a seceding state. In this way, in the following spring, the original seven seceding states were reinforced by four of the Border states.

The Border States.

224. In the North and West surprisingly little attention was given to the systematic course of procedure along the

[1] Lincoln received 180 electoral votes, Breckinridge 72, Bell 39 and Douglas 12. Their popular votes were 1,866,352, 847,514, 587,830 and 1,375,157 respectively.

Gulf. The people of those sections were very busy; they had heard much of this talk before, and looked upon it as a kind of stage-thunder, the inevitable accompaniment of recent presidential elections. Republican politicians, with the exception of a few, were inclined to refrain from public declarations of intention. Some of them such as Seward, showed a disposition to let the "erring sisters" depart in peace, expecting to make the loss good by accessions from Canada. A few, like Senator Zachariah Chandler, believed that there would be "blood-letting," but most of them were still doubtful as to the future. In the North the leaders and the people generally shrank from the prospect of war, and many were prepared to make radical concessions to avert hostilities. Among the various proposals to this end that offered in the Senate by John J. Crittenden, of Kentucky, and known as the Crittenden Compromise, was perhaps received with most favour. This took the form of six proposed amendments to the Constitution, of which two were virtually a rephrasing of the essential feature of the Missouri Compromise and of the principle of popular or squatter sovereignty, and others provided that the national government should pay to the owner of any fugitive slave, whose return was prevented by opposition in the North, the full value of such slave, and prohibited the abolition of slavery in the District of Columbia "so long as it exists in the adjoining states of Virginia and Maryland or either." This proposed compromise was rejected by the Senate by a close vote on the 2nd of March 1861. A Peace Congress, called by Virginia, met in Washington from the 4th to the 27th of February 1861, 21 states being represented, and proposed a constitutional amendment embodying changes very similar to those of the Crittenden Compromise, but its proposal was not acted upon by Congress. Democratic politicians were hide-bound by their repetition of the phrase "voluntary Union"; they had not yet hit upon the theory which carried the War Democrats through the final struggle, that the sovereign state of New York could make war upon the sovereign state of South Carolina for the unfriendly act of secession, and that the war was waged by the non-seceding against the seceding states. President Buchanan publicly condemned the doctrine of secession, though he added a confession of his inability to see how secession was to be prevented if a state should be so wilful as to attempt it. Congress did nothing, except to admit Kansas as a free state and adopt the protective Morrill tariff; even after its members from the seceding states had withdrawn, those who remained made no preparations for conflict, and, at their adjournment in March 1861, left the Federal government naked and helpless.

Feeling in the North.

Admission of Kansas; Morrill Tariff of 1861.

225. The only sign of life in the body politic, the half-awakened word of warning from the Democracy of the North and West, was its choice of governors of states. A remarkable group of men, soon to be known as the "war governors"—Israel Washburn of Maine, Erastus Fairbanks of Vermont, Ichabod Goodwin of New Hampshire, John Albion Andrew of Massachusetts, William Sprague of Rhode Island, William Alfred Buckingham of Connecticut, Edwin Dennison Morgan of New York, Charles Smith Olden of New Jersey, Andrew Gregg Curtin of Pennsylvania, William Dennison of Ohio, Oliver Perry Morton of Indiana, Richard Yates of Illinois, Austin Blair of Michigan, Alexander Williams Randall of Wisconsin, Samuel Jordan Kirkwood of Iowa, and Alexander Ramsey of Minnesota—held the executive powers of the Northern states in 1861–1862. Some of these governors, such as Andrew and Buckingham, as they saw the struggle come nearer, went so far as to order the purchase of warlike material for their states on their private responsibility, and their action saved days of time.

The "War Governors."

226. The little army of the United States had been almost put out of consideration; wherever its detachments could be found in the South they were surrounded and forced to surrender and were transferred to the North. After secession, and in some of the states even before it, the forts, arsenals, mints, custom-houses, ship-yards and public property of the United States had been seized by authority of the state, and these were held until transferred to the new Confederate States organization. In the first two months of 1861 the authority of the United States was paralysed in seven states, and in at least seven more its future authority seemed of very doubtful duration.

Seizure of United States Property.

227. Only a few forts, of all the magnificent structures with which the nation had dotted the Southern coast, remained to it—the forts near Key West, Fortress Monroe at the mouth of Chesapeake Bay, Fort Pickens at Pensacola and Fort Sumter in Charleston harbour. Both the last-named were beleaguered by hostile batteries, but the administration of President Buchanan, intent on maintaining the peace until the new administration should come in, instructed their commanding officers to refrain from any acts tending to open conflict. The Federal officers, therefore, were obliged to look idly on while every preparation was made for their destruction, and even while a vessel bearing supplies for Fort Sumter was driven back by the batteries between it and the sea.

Position of the Remaining Forts.

228. The divergence between the two sections of the country had thus passed into disunion, and was soon to pass into open hostility. The legal recognition of the custom of slavery, acting upon and reacted upon by every step in their economic development and every difference in their natural characteristics, surroundings and institutions, had carried North and South further and faster apart, until the elements of a distinct nationality had appeared in the latter. Slavery had had somewhat the same effect on the South that democracy had had on the colonies. In the latter case the aristocracy of the mother-country had made a very feeble struggle to maintain the unity of its empire. It remained to be seen, in the American case, whether democracy would do better.

Slavery and Disunion.

K.—*The Civil War, 1861–1865.*

229. Secession had taken away many of the men who had for years managed the Federal government, and who understood its workings. Lincoln's party was in power for the first time; his officers were new to the routine of Federal administration; and the circumstances with which they were called upon to deal were such as to daunt any spirit. The government had become so nearly bankrupt in the closing days of Buchanan's administration that it had only escaped by paying double interest, and that by the special favour of the New York banks, which obtained in return the appointment of John A. Dix as secretary of the treasury. The army had been almost broken up by captures of men and material and by resignations of competent and trusted officers. The navy had come to such a pass that, in February 1861, a House committee reported that only two vessels, one of twenty, the other of two guns, were available for the defence of the entire Atlantic coast. And, to complicate all difficulties, a horde of clamorous office-seekers crowded Washington.

Embarrassments of the Government.

230. Before many weeks of Lincoln's administration had passed, the starting of an expedition to provision Fort Sumter brought on an attack by the batteries around the fort, and after a bombardment of 36 hours the fort surrendered (April 14, 1861). It is not necessary to rehearse the familiar story of the outburst of feeling which followed this event and the proclamation of President Lincoln calling for volunteers. The 75,000 volunteers called for were supplied three or four times over, and those who were refused felt the refusal as a personal deprivation.

Fort Sumter. Rising in the North.

231. There had been some belief in the South that the North-West would take no part in the impending conflict, and that its people could be persuaded to keep up friendly relations with the new nationality until the final treaty of peace should establish all the fragments of the late Union upon an international basis. In the spring months of 1861 Douglas, who had long been

The North-West.

denounced as the tool of the Southern slave-holders, was spending the closing days of life in expressing the determination of the North-West that it would never submit to have "a line of custom-houses" between it and the ocean. The batteries which Confederate authority was erecting on the banks of the Mississippi were fuel to the flame. Far-off California, which had been considered neutral by all parties, pronounced as unequivocally for the national authority.

232. The shock of arms put an end to opposition in the South as well. The peculiar isolation of life in the South precluded the more ignorant voter from any comparisons of the power of his state with any other; to him it was almost inconceivable that his state should own or have a superior. The better educated men, of wider experience, had been trained to think state sovereignty the foundation of civil liberty, and, when their state spoke, they felt bound to "follow their state." The president of the Confederate States issued his call for men, and it also was more than met.

"Following the State."

233. Lincoln's call for troops met with an angry reception wherever the doctrine of state sovereignty had a foothold. The governors of the Border states generally returned it with a refusal to furnish any troops. Two states, North Carolina and Arkansas, seceded and joined the Confederate States. In two others, Virginia and Tennessee, the state politicians formed "military leagues" with the Confederacy, allowing Confederate troops to take possession of the states, and then submitted the question of secession to "popular vote." The secession of these states was thus accomplished, and Richmond became the Confederate capital. The same process was attempted in Missouri, but failed, and the state remained loyal. The politician class in Maryland and Kentucky took the extraordinary course of attempting to maintain neutrality; but the growing power of the Federal government soon enabled the people of the two states to resume control of their governments and give consistent support to the Union. Kentucky, however, had troops in the Confederate armies; and one of her citizens, the late vice-president, John C. Breckinridge, left his place in the Senate and became an officer in the Confederate service. Delaware cast her lot from the first with the Union.

The Border States.

234. The first blood of the war was shed in the streets of Baltimore, when a mob attempted to stop Massachusetts troops on their way to Washington (April 19). For a time there was difficulty in getting troops through Maryland because of the active hostility of a part of its people, but this was overcome, and the national capital was made secure. The Confederate lines had been pushed up to Manassas Junction, about 30 m. from Washington. When Congress, called into special session by the president for the 4th of July, came together, the outline of the Confederate States had been fixed. Their line of defence held the left bank of the Potomac from Fortress Monroe nearly to Washington; thence, at a distance of some 30 m. from the river, to Harper's Ferry; thence through the mountains of western Virginia and the southern part of Kentucky, crossing the Mississippi a little below Cairo; thence through southern Missouri to the eastern border of Kansas; and thence south-west through the Indian Territory and along the northern boundary of Texas to the Rio Grande. The length of the line, including also the Atlantic and Gulf coasts, has been estimated at 11,000 m. The territory within it comprised about 800,000 sq. m., with a population of over 9,000,000 and great natural resources. Its cotton was almost essential to the manufactories of the world; in exchange for it every munition of war could be procured; and it was hardly possible to blockade a coast over 3000 m. in length, on which the blockading force had but one port of refuge, and that about the middle of the line. Nevertheless President Lincoln issued his first call for troops on the 15th of April, President Davis then issued a proclamation (on the 17th) offering letters of marque and reprisal against the commerce of the United States to private vessels, and on the 19th Lincoln answered with a proclamation announcing the blockade of the Southern coast. The news brought out proclamations of neutrality from Great Britain and France, and, according to subsequent decisions of the Supreme Court, made the struggle a civil war, though the minority held that this did not occur legally until the act of Congress of the 13th of July 1861, authorizing the president, in case of insurrection, to shut up ports and suspend commercial intercourse with the revolted district.

Civil War.

The Blockade.

235. The president found himself compelled to assume powers never granted to the executive authority, trusting to the subsequent action of Congress to validate his action. He had to raise and support armies and navies; he even had to authorize seizures of necessary property, of railroad and telegraph lines, arrests of suspected persons, and the suspension of the writ of habeas corpus in certain districts. Congress supported him, and proceeded in 1863 to give the president power to suspend the writ anywhere in the United States; this power he promptly exercised. The Supreme Court, after the war, in the Milligan case (4 Wallace, 133) decided that no branch of the government had power to suspend the writ in districts where the courts were open—that the *privilege* of the writ might be suspended as to persons properly involved in the war, but that the writ was still to issue, the court deciding whether the person came within the classes to whom the suspension applied. This decision, however, did not come until "arbitrary arrests," as they were called, had been a feature of the entire war. A similar suspension took place in the Confederate States.

Suspension of "Habeas Corpus."

236. When Congress met (July 4, 1861) the absence of Southern members had made it heavily Republican. It decided to consider no business but that connected with the war, authorized a loan and the raising of 500,000 volunteers, and made confiscation of property a penalty of rebellion. While it was in session the first serious battle of the war—Bull Run, or Manassas—took place (July 21), and resulted in the defeat of the Federal army. (For this and the other battles of the war see AMERICAN CIVIL WAR, and the supplementary articles dealing with particular battles and campaigns.) The over-zealous action of a naval officer in taking the Confederate envoys James M. Mason and John Slidell out of the British steamer "Trent" sailing between two neutral ports almost brought about a collision between the United States and Great Britain in November. But the American precedents were all against the United States, and the envoys were given up.

Congress.

Bull Run.

The "Trent" Case.

237. The broad-construction tendencies of the Republican party showed themselves more plainly as the war grew more serious; there was an increasing disposition to cut every knot by legislation, with less regard to the constitutionality of the legislation. A paper currency, commonly known as "greenbacks" (*q.v.*), was adopted and made legal tender (Feb. 25, 1862). The first symptoms of a disposition to attack slavery appeared: slavery was prohibited (April 16) in the District of Columbia and the Territories (June 19); the army was forbidden to surrender escaped slaves to their owners; and slaves of insurgents were ordered to be confiscated. In addition to a homestead act (see HOMESTEAD AND EXEMPTION LAWS) giving public lands to actual settlers at reduced rates, Congress began a further development of the system of granting public lands to railways. Another important act (1862) granted public lands for the establishment of agricultural and mechanical colleges (see MORRILL, J. S.).

Paper Currency; Slavery.

238. The railway system of the United States was but twenty years old in 1850, but it had begun to assume some consistency. The day of short and disconnected lines had passed, and the connexions which were to develop into railway systems had appeared. Consolidation of smaller companies had begun; the all-rail route across the state of New York was made up of more than a dozen original companies at its consolidation in 1853. The Erie railway, chartered in 1832, was completed from

Railways in 1850.

Piermont to Dunkirk, New York, in 1851; and another line—the Pennsylvania—was completed from Harrisburg to Pittston, Pennsylvania, in 1854. These were at least the germs of great trunk lines. The cost of American railways has been only from one-half to one-fourth of the cost of European railways; but an investment in a Far Western railway in 1850-1860 was an extra-hazardous risk. Not only did social conditions make any form of business hazardous; the new railway often had to enter a territory bare of population, and there create its own towns, farms and traffic. Whether it could do so was so doubtful as to make additional inducements to capital necessary. The means attempted by Congress in 1850, in the case of the Illinois Central railroad, was to grant public lands to the corporation, reserving to the United States the alternate sections. At first grants were made to the states for the benefit of the corporations; the act of 1862 made the grant directly to the corporation.

Land Grants.

239. The vital military and political necessity of an immediate railway connexion with the Pacific coast was hardly open to doubt in 1862; but the necessity hardly justified the terms which were offered and taken. The Union Pacific railroad was incorporated; the United States government was to issue to it bonds, on the completion of each 40 m., to the amount of $16,000 per mile, to be a first mortgage; through Utah and Nevada the aid was to be doubled, and for some 300 m. of mountain building to be trebled; and, in addition to this, alternate sections of land were granted. The land-grant system, thus begun, was carried on extensively, the largest single grants being those of 47,000,000 acres to the Northern Pacific (1864) and of 42,000,000 to the Atlantic & Pacific line (1866).

The Pacific Railways.

240. Specie payments had been suspended almost everywhere towards the end of 1861; but the price of gold was but 102·5 at the beginning of 1862. About May its price in paper currency began to rise. It touched 170 during the next year, and 285 in 1864; but the real price probably never went much above 250. Other articles felt the influence in currency prices. Mr D. A. Wells, in 1866, estimated that prices and rents had risen 90% since 1861, while wages had not risen more than 60%.

Prices in Paper.

241. The duties on imports were driven higher than the original Morrill tariff had ever contemplated. The average rates, which had been 18% on dutiable articles and 12% on the aggregate in 1860-1861, rose, before the end of the war, to nearly 50% on dutiable articles and 35% on the aggregate. Domestic manufactures sprang into new life under such hothouse encouragement; every one who had spare wealth converted it into manufacturing capital. The probability of such a result had been the means of getting votes for an increased tariff; free traders had voted for it as well as protectionists. For the tariff was only a means of getting capital into positions in which taxation could be applied to it, and the "internal revenue" taxation was merciless beyond precedent. The annual increase of wealth from capital was then about $550,000,000; the internal revenue taxation on it rose in 1866 to $310,000,000, or nearly 60%.

Tariff and Internal Revenue Taxation.

242. The stress of all this upon the poor must have been great, but it was relieved in part by the bond system on which the war was conducted. While the armies and navies were shooting off large blocks of the crops of 1880 or 1890, work and wages were abundant for all who were competent for them. It is true, then, that the poor paid most of the cost of the war; it is also true that the poor had shared in that anticipation of the future which had been forced on the country, and that, when the drafts on the future came to be redeemed, it was done mainly by taxation on luxuries. The destruction of a Northern railway meant more work for Northern iron mills and their workmen. The destruction of a Southern road was an unmitigated injury; it had to be made good at once, by paper issues; the South could make no drafts on the future, by bond issues, for the blockade had put cotton out of the game, and Southern bonds were hardly saleable. Every expense had to be met by paper issues; each issue forced prices higher; every rise in prices called for an increased issue of paper, with increased effects for evil. *A Rebel War-Clerk's Diary* gives the following as the prices in the Richmond market for May 1864: "Boots, $200; coats, $350; pantaloons, $100; shoes, $125; flour, $275 per barrel; meal, $60 to $80 per bushel; bacon, $9 per pound; no beef in market; chickens, $30 per pair; shad, $20; potatoes, $25 per bushel; turnip greens, $4 per peck; white beans, $4 per quart or $120 per bushel; butter, $15 per pound; lard, same; wood, $50 per cord." How the rise in wages, always far slower than other prices, could meet such prices as these one must be left to imagine. Most of the burden was sustained by the women of the South.

Bonds.

Paper Issues in the South.

243. The complete lack of manufactures told heavily against the South from the beginning. As men were drawn from agriculture in the North and West, the increased demand for labour was shaded off into an increased demand for agricultural machinery; every increased percentage of power in reaping-machines liberated so many men for service at the front. The reaping-machines of the South—the slaves—were incapable of any such improvement, and, besides, required the presence of a portion of the possible fighting-men at home to watch them. There is an evident significance in the exemption from military duty in the Confederate States of "one agriculturist on such farm, where there is no white male adult not liable to duty, employing 15 able-bodied slaves between ten and fifty years of age." But, to the honour of the enslaved race, no insurrection took place.

Manufactures.

244. The pressing need for men in the army made the Confederate Congress utterly unable to withstand the growth of executive power. Its bills were prepared by the cabinet, and the action of Congress was quite perfunctory. The suspension of the writ of *habeas corpus*, and the vast powers granted to President Davis, or assumed by him under the plea of military necessity, with the absence of a watchful and well-informed public opinion, made the Confederate government by degrees almost a despotism. It was not until the closing months of the war that the expiring Confederate Congress mustered up courage enough to oppose the president's will. (See CONFEDERATE STATES OF AMERICA.) The organized and even radical opposition to the war in the North, the meddlesomeness of Congress and its "committees on the conduct of the war," were no doubt unpleasant to Lincoln but they carried the country through the crisis without the effects visible in the South.

Confederate Congress and President.

245. Another act of Federal legislation—the National Bank Act (Feb. 25, 1863; supplemented by the act of June 3, 1864)—should be mentioned here, as it was closely connected with the sale of bonds. The banks were to be organized, and, on depositing United States bonds at Washington, were to be permitted to issue notes up to 90% of the value of the bonds deposited. As the redemption of the notes was thus assured, they circulated without question all over the United States. By a subsequent act (1865) the remaining state bank circulation was taxed out of existence. (See BANKS AND BANKING: *United States*.)

National Banking System.

246. At the beginning of 1862 the lines of demarcation between the two powers had become plainly marked. The western part of Virginia had separated itself from the parent state, and was admitted as a state (1863) under the name of West Virginia. It was certain that Delaware, Maryland, Kentucky and Missouri had been saved to the Union, and that the battle was to be fought out in the territory to the south of them.

Admission of West Virginia.

247. At the beginning of the war the people and leaders of the North had not desired to interfere with slavery, but circumstances had been too strong for them. Lincoln had declared that he meant to save the Union as he best could—by preserving slavery, by destroying it, or by destroying part

and preserving part of it. Just after the battle of Antietam (17 Sept. 1862) he issued his proclamation calling on the revolted states to return to their allegiance before the next year, otherwise their slaves would be declared free men. No state returned, and the threatened declaration was issued on the 1st of January 1863. As president, Lincoln could issue no such declaration; as commander-in-chief of the armies and navies of the United States he could issue directions only as to the territory within his lines; but the Emancipation Proclamation applied only to territory outside of his lines. It has therefore been debated whether the proclamation was in reality of any force. It may fairly be taken as an announcement of the policy which was to guide the army, and as a declaration of freedom taking effect as the lines advanced. At all events, this was its exact effect. Its international importance was far greater. The locking up of the world's source of cotton supply had been a general calamity, and the Confederate government and people had steadily expected that the English and French governments, or at least one of them, would intervene in the war for the purpose of raising the blockade and releasing the Southern cotton. The conversion of the struggle into a crusade against slavery made intervention impossible for governments whose peoples had now a controlling influence on their policy and intelligence enough to understand the issue.

The Emancipation Proclamation.

248. Confederate agents in England were numerous and active. Taking advantage of every loophole in the British Foreign Enlistment Act, they built and sent to sea the "Alabama" and "Florida," which for a time almost drove Federal commerce from the ocean. Whenever they were closely pursued by United States vessels they took refuge in neutral ports until a safe opportunity occurred to put to sea again. Another, the "Georgia," was added in 1863. All three were destroyed in 1864. (See ALABAMA ARBITRATION.) Confederate attempts to have ironclads equipped in England and France were unsuccessful.

Confederate Privateers.

249. The turning-point of the war was evidently in the early days of July 1863, when the victories of Vicksburg and Gettysburg came together. The national government had at the beginning cut the Confederate States down to a much smaller area than might well have been expected; its armies had pushed the besieging lines far into the hostile territory, and had held the ground which they had gained; and the war itself had developed a class of generals who cared less for the conquest of territory than for attacking and destroying the opposing armies. The great drafts on the future which the credit of the Federal government enabled the North to make gave it also a startling appearance of prosperity; so far from feeling the war, it was driving production of every kind to a higher pitch than ever before.

The Current of Success changes.

250. The war had not merely developed improved weapons and munitions of war; it had also spurred the people on to a more careful attention to the welfare of the soldiers, the fighting men drawn from their own number. The sanitary commission, the Christian commission, and other voluntary associations for the physical and moral care of soldiers, received and disbursed very large sums. The national government was paying an average amount of $2,000,000 per day for the prosecution of the war, and, in spite of the severest taxation, the debt grew to $500,000,000 in June 1862, to twice that amount a year later, to $1,700,000,000 in June 1864, and reached its maximum on the 31st of August 1865—$2,845,907,626. But this lavish expenditure was directed with energy and judgment. The blockading fleets were kept in perfect order and with every condition of success. The railway and telegraph were brought into systematic use for the first time in modern warfare. Late in 1863 Edwin M. Stanton, the secretary of war, moved two corps of 23,000 men from Washington to Chattanooga, 1200 m., in seven days. A year later he moved another corps, 15,000 strong, from Tennessee to Washington in eleven days, and within a month had collected vessels and transferred it to North Carolina.

251. On the other hand, the Federal armies now held almost all the great southern through lines of railroad, except the Georgia lines and those which supplied Lee from the South. The want of the Southern people was merely growing in degree, not in kind. The conscription, sweeping from the first, had become omnivorous; towards the end of the war every man between seventeen and fifty-five was legally liable to service, and in practice the only limit was physical incapacity. In 1863 the Federal government also was driven to conscription. The first attempts to carry it out resulted in forcible resistance in several places, the worst being the "draft riots" in New York (July), when the city was in the hands of the mob for several days. All the resistance was put down; but exemptions and substitute purchases were so freely permitted that the draft in the North had little effect except as a stimulus to the states in filling their quotas of volunteers by voting bounties.

Conscription.

252. In 1864 Lincoln was re-elected with Andrew Johnson as vice-president. The Democratic Convention had declared that, after four years of failure to restore the Union by war, during which the Constitution had been violated in all its parts under the plea of military necessity, a cessation of hostilities ought to be obtained, and had nominated General George B. McClellan and G. H. Pendleton. Farragut's victory in Mobile Bay (Aug. 5), by which he sealed up the last port, except Wilmington, of the blockade-runners, and the evidently staggering condition of the Confederate resistance in the East and the West, were the sharpest commentaries on the Democratic platform; and its candidates carried only three of the twenty-five states which took part in the election.[1] The thirty-sixth state—Nevada—had been admitted in 1864.

Election of 1864.

Admission of Nevada.

253. The actual fighting of the war may be said to have ended with the surrender of General Robert E. Lee to General U.S. Grant at Appomattox, Va., on the 9th of April 1865. All the terms of surrender named by Grant were generous: no private property was to be surrendered; both officers and men were to be dismissed on parole, not to be disturbed by the United States government so long as they preserved their parole and did not violate the laws; and he instructed the officers appointed to receive the paroles "to let all the men who claim to own a horse or mule take the animals home with them to work their little farms." It should be stated, also, to Grant's honour that, when the politicians afterwards undertook to repudiate some of the terms of surrender, he personally intervened and used the power of his own name to force an exact fulfilment. General Joseph E. Johnston, with the only other considerable army in the field, surrendered on much the same terms at Durham Station, N.C. (April 26), after an unsuccessful effort at a broader settlement. All organized resistance had now ceased; Union cavalry were ranging the South, picking up government property or arresting leaders; but it was not until May that the last detached parties of Confederates gave up the contest.

Surrender of Lee.

Surrender of Johnston.

254. Just after Lee's surrender President Lincoln died by assassination (April 15), the crime of a half-crazed enthusiast. Even this event did not impel the American people to any vindictive use of their success for the punishment of individuals. In the heat of the war, in 1862, Congress had so changed the criminal law that the punishment of treason and rebellion should no longer be death alone, but death or fine and imprisonment. Even this modified punishment was not inflicted. There was no hanging; some of the leaders were imprisoned for a time, but never brought to trial.

Death of Lincoln.

255. The armies of the Confederacy are supposed to have been at their strongest (700,000) at the beginning of 1863; and it is doubtful whether they contained 200,000 men in March 1865. The dissatisfaction of the southern people at the manner in which Davis

The Opposing Armies.

[1] Lincoln received 212 electoral votes and McClellan only 21; but Lincoln's popular vote was only about 407,000 in excess of McClellan's, out of about 4,000,000.

had managed the war seems to have been profound; and it was only converted into hero-worship by the ill-advised action of the Federal government in arresting and imprisoning him. Desertion had become so common in 1864, and the attempts of the Confederate government to force the people into the ranks had become so arbitrary, that the bottom of the Confederacy, the democratic elements which had given it all the success it had ever obtained, had dropped out of it before Sherman moved northward from Savannah; in some parts the people had really taken up arms against the conscripting officers. On the contrary, the numbers of the Federal armies increased steadily until March 1865, when they were a few hundreds over a million. As soon as organized resistance ceased, the disbanding of the men began; they were sent home at the rate of about 300,000 a month, about 50,000 being retained in service as a standing army. The cost of the Civil War has been variously estimated: by Mulhall (*Dictionary of Statistics*, 4th ed., 1899, p. 541) at £555,000,000 and (p. 586) at £740,000,000; by Nicolay and Hay (*Abraham Lincoln*, vol. x., p. 339) at $3,250,000,000 to the North and $1,500,000,000 to the South; by Edward Atkinson (the *Forum*, October 1888, p. 133), including the first three years of Reconstruction at $5,000,000,000 to the North and $3,000,000,000 to the South. The last alone of these estimates is an approximation to the truth. The ordinary receipts of the government for the four fiscal years 1862 to 1865 totalled $729,458,336, as compared with $196,963,373 for the four preceding years, 1858–1861; the difference representing the effort of the treasury to meet the burden of war. In the same period more than $2,600,000,000 was secured in loans upon the credit of the nation; and this total was raised by later borrowings on account of the war to more than $2,800,000,000. The immediate and direct cost of the struggle to the North was therefore about $3,330,000,000. To this sum must be added, in order to obtain the final and total cost: (1) the military pensions paid on account of the war since 1861—about $3,600,000,000 up to 1909, inclusive; (2) the interest on the war debt, approximately $3,024,000,000 in the same period; (3) the expenditures made during the war by state and local governments, which have never been totalled, but may be put at $1,000,000,000; and (4) the abnormal expenditures for army and navy during some years following the war, which may be put, conservatively, at $500,000,000. The result is a total of some $11,450,500,000 for the North alone. But the cost to the South also was enormous; $4,000,000,000 cannot be an exaggeration. It follows that, up to 1909, the cost of the war to the nation had approximated the tremendous total of $15,500,000,000.

Cost of the War.

256. In return for such an expenditure, and the death of probably 300,000 men on each side, the abiding gain was incalculable. The rich section, which had been kept back in the general development by a single institution, and had been a clog on the advance of the whole country, had been dragged up to a level with the rest of the country. Free labour was soon to show itself far superior to slave labour in the South; and the South was to reap the largest material gain from the destruction of the Civil War. The persistent policy of paying the debt immediately resulted in the higher taxation falling on the richer North and West. As a result of the struggle the moral stigma of slavery was removed. The power of the nation, never before asserted openly, had made a place for itself; and yet the continuing power of the states saved the national power from a development into centralized tyranny. And the new power of the nation, by guaranteeing the restriction of government to a single nation in central North America, gave security against any introduction of international relations, international armament, international wars, and continual war taxation into the territory occupied by the United States. Finally, democracy in America had certainly shown its ability to maintain the unity of its empire.

Results of the War.

BIBLIOGRAPHY.—*Sources*: The proceedings of the Continental Congress from 1783 to 1788 are in *The Journals of Congress*, vols. viii. to xiii., and *The Secret Journals of Congress*, 4 vols. There is a new and greatly improved edition of the *Journals* (Washington, 1904–), edited by W. C. Ford and Gaillard Hunt from the originals in the Library of Congress. The debates of Congress for the period from 1789 to 1824, were collected from newspapers, abridged and published under the title of *The Annals of Congress* (43 vols., Washington, 1834–1856). The principal debates from 1825 to 1837 are in the *Register of Debates in Congress* (29 vols., Washington, 1825–1837), and from 1833 to 1873 the debates are in the *Congressional Globe* (108 vols., Washington, 1834–1873). There is an *Abridgement of the Debates of Congress*, from 1789 to 1856, by T. H. Benton (16 vols., New York, 1860). The acts of Congress, together with important documents, are in the appendices of the *Annals*, *Register* and *Globe*. See also *United States Statutes at Large*, from 1789 to 1865 (13 vols., Boston, 1845–1866), vol. vii. contains the treaties between the United States and the Indian tribes to 1845; and *Indian Affairs, Laws and Treaties*, edited by C. J. Kappler under direction of the Senate committee on Indian affairs (Washington, 1904). Treaties of the United States have been published in *Statutes at Large*, and in *Treaties, Conventions, International Acts, Protocols and Agreements between the United States of America and Other Powers, 1776–1909* (Washington, 1910) which superseded a collection of 1889 edited by John H. Haswell. The decisions of the United States Supreme Court were reported from 1789 to 1800 by A. J. Dallas (4 vols., Philadelphia, 1790–1807); from 1801 to 1815 by William Cranch (9 vols., Washington, 1804–1817); from 1816 to 1827 by Henry Wheaton (12 vols., New York, 1816–1827); from 1828 to 1842 by Richard Peters (16 vols., Philadelphia, *et al.*, 1828–1842); from 1843 to 1860 by B. C. Howard (24 vols., Philadelphia, *et al.*, 1843–1860); in 1861 and 1862 by J. S. Black (2 vols., Washington, 1862–1863); and from 1863 to 1874 by J. W. Wallace (23 vols., Washington, 1865–1876). There is a valuable collection of *Cases* on constitutional law, in 2 vols., by J. B. Thayer (Cambridge, 1894–1895). A large portion of the important executive documents are contained in *The Messages and Papers of the Presidents, 1789–1897*, compiled by J. D. Richardson (10 vols., Washington, 1896–1899), and the *American State Papers: Documents Legislative and Executive* (38 vols., Washington, 1832–1861); two volumes of these *State Papers* relate to commerce and navigation, 1789–1823; five to finance, 1789–1828; six to foreign relations, 1789–1859; two to Indian affairs, 1789–1827; seven to military affairs, 1789–1838; four to naval affairs, 1789–1836; eight to public lands, 1789–1837; one to the post office department; two to miscellaneous affairs. There is considerable first-hand material on the framing and ratification of the Constitution in the *Documentary History of the Constitution, 1786–1870* (5 vols., Washington, 1894–1905), and *The Debates in the Several State Conventions on the Adoption of the Federal Constitution . . . together with the Journal of the Federal Convention*, by Jonathan Elliot (5 vols., Philadelphia, 1861; 2nd ed., 1888). See also J. F. Jameson, "Studies in the History of the Federal Convention of 1787," in the *Annual Report* of the American Historical Association for 1902, vol. i.; and *Pennsylvania and the Federal Constitution* (Philadelphia, 1888), edited by J. B. McMaster and F. D. Stone. For the Civil War by far the most important source is the vast compilation of the *Official Records of the Union and Confederate Armies*, in four series, an atlas and a general index (Washington, 1880–1900). The material in William MacDonald's *Select Documents Illustrative of the History of the United States, 1776–1861* (New York, 1898) relates almost wholly to constitutional development, foreign relations and banking. A. B. Hart's *American History told by Contemporaries* (New York, 1901), of which vol. iii. and part of vol. iv. are collected from this period, consists largely of contemporary narratives, correspondence and extracts from diaries on a great variety of subjects. The Library of Congress has 333 vols. of *Washington Manuscripts*, 135 vols. of *Jefferson Manuscripts*, 75 vols. of *Madison Manuscripts*, 64 vols. of *Alexander Hamilton Manuscripts*, more than 200 letters between Jackson and Van Buren, a collection of Polk papers, the more important part of Webster's correspondence, a few Clay letters, 22 vols. of Salmon P. Chase papers besides over 6300 letters, and 440 Blennerhassett manuscripts. The Massachusetts Historical Society has the Adams papers; the Historical Society of Pennsylvania has the Buchanan papers; the Historical Society of New Hampshire has a large collection of Webster papers; and the Historical Society of Chicago has some of the Polk papers. Various valuable reports on manuscript materials available to students of this period have been published in the *Annual Reports* of the Historical Manuscripts Commission of the American Historical Association, and there is much valuable material in the *Annual Reports* of the association and in the volumes of the *American Historical Review*. The American Historical Association has published an index in its "Bibliography of American Historical Societies," edited by A. P. C. Griffin, in vol. ii. of its *Annual Report* for 1905 (Washington, 1907). See also, for social and economic sources, *Documentary History of American Industrial Society* (Cleveland, O., 1910 sqq.). Among the most useful published works of the public men of the period are: *The Writings of George Washington* edited by W. C. Ford (14 vols., New York, 1889–1893); *Complete Works of Alexander Hamilton*, edited by H. C. Lodge (9 vols., New York, 1885–1886), and *The Works of John Adams . . . with a Life of the Author*, edited, with

Life, by C. F. Adams (10 vols., Boston, 1850–1856), representing the Federalists; *The Writings of James Madison*, edited by Gaillard Hunt (9 vols., New York, 1900–1910), and *The Writings of Thomas Jefferson*, edited by P. L. Ford (10 vols., New York, 1892–1899), representing the Anti-Federalists or Republicans; *The Writings of James Monroe*, edited by S. H. Hamilton (7 vols., New York, 1898–1903); *Memoirs of John Quincy Adams, comprising Portions of his Diary from 1795 to 1848*, edited by C. F. Adams (12 vols., Philadelphia, 1874–1877); *Works of Henry Clay, comprising his Life, Correspondence and Speeches*, edited, with *Life*, by Calvin Colton (10 vols., New York, 1904) and Thomas Hart Benton's *Thirty Years' View; or, a History of the Working of the American Government* (2 vols., New York, 1854–1856), for the "Middle Period"; *The Writings and Speeches of Daniel Webster*, edited by J. W. McIntyre (18 vols., Boston, 1903); *Letters of Daniel Webster*, edited by C. H. van Tyne (New York, 1902); *Complete Works of Abraham Lincoln, comprising his Speeches, Letters, State Papers and Miscellaneous Writings*, edited by J. G. Nicolay and John Hay (2 vols., New York, 1902); *The Works of William H. Seward*, edited by G. E. Baker (5 vols., 2nd ed., Boston, 1883–1890), and *The Works of Charles Sumner* (15 vols., Boston, 1870–1883), for the Northern view; *The Works of John C. Calhoun*, edited by R. K. Crallé (6 vols., New York, 1854–1855); Alexander H. Stephens, *Constitutional View of the Late War between the States* (2 vols., Philadelphia, 1868–1870), and Jefferson Davis, *Rise and Fall of the Confederate Government* (2 vols., New York, 1881), for the Southern view.

Secondary Works: Three large and important secondary works cover the whole, or nearly the whole, period from the War of Independence to the Civil War. They are: James Schouler, *History of the United States of America under the Constitution* (rev. ed., 6 vols., New York, 1899), scholarly and comprehensive, but lacking in clearness, and, in the latter portion, unfair to the South; J. B. McMaster, *History of the People of the United States from the Revolution to the Civil War* (7 vols., New York, 1883–1910), especially valuable for its treatment of social and economic conditions and for material gathered from newspapers; H. E. von Holst, *Constitutional and Political History of the United States* (2nd ed., 8 vols., Chicago, 1899), chiefly a treatment of the constitutional aspects of slavery by a German with strong ethical and strong anti-slavery sentiments. The period is ably treated in sections by A. C. McLaughlin, *The Confederation and the Constitution*, vol. x. of "The American Nation Series" (New York, 1905); J. S. Bassett, *The Federal System*, vol. ii. of "The American Nation Series"; Henry Adams, *History of the United States of America during the Administrations of Jefferson and Madison* (9 vols., New York, 1891), quotes freely from records in foreign archives; J. W. Burgess, *The Middle Period, 1817–1858* (New York, 1901), and J. F. Rhodes, *History of the United States from the Compromise of 1850* (7 vols., New York, 1900–1906), which, although written largely from Northern sources, is for the most part fair and judicial. For lists of works dealing with special events (*e.g.* the Missouri Compromise, the Compromise of 1850, the Fugitive Slave Law, &c.), see the articles devoted to those subjects. See also vols. xii. to xxi. of "The American Nation Series," consisting of Edward Channing, *The Jeffersonian System*; K. C. Babcock, *The Rise of American Nationality*; F. J. Turner, *Rise of the New West*; William MacDonald, *Jacksonian Democracy*; A. B. Hart, *Slavery and Abolition*; G. P. Garrison, *Westward Expansion*; T. C. Smith, *Parties and Slavery*; F. E. Chadwick, *Causes of the Civil War*; and J. K. Hosmer, *The Appeal to Arms*, and *Outcome of the Civil War*. For further study of the Civil War see Edward McPherson, *Political History of the United States during the Great Rebellion* (Washington, 1864; 3rd ed., 1876), chiefly a compilation of first-hand material; J. W. Burgess, *The Civil War and the Constitution* (2 vols., New York, 1901). The best account of the military operations of the Mexican War is in R. S. Ripley, *The War with Mexico*, (2 vols., New York, 1849). For a list of works relating to the military events of the War of 1812 and the Civil War see the separate articles on those subjects. On the War with France, 1798, see G. W. Allen, *Our Naval War with France* (New York, 1909). On the development of the West there are: H. B. Adams, *Maryland's Influence upon Land Cessions to the United States* (Baltimore, 1885); B. A. Hinsdale, *The Old North-West* (revised ed., New York, 1899), a scholarly work; Justin Winsor, *The Westward Movement* (Boston, 1897), a storehouse of facts, but dry for the general reader; Theodore Roosevelt, *The Winning of the West* (4 vols., New York, 1889–1896), a graphic outline. Other important works on special subjects are: Edward Stanwood, *History of the Presidency* (Boston, 1898), a study of presidential campaigns; J. P. Gordy, *History of Political Parties in the United States* (2 vols., rev. ed., New York, 1900–1902); E. D. Warfield, *The Kentucky Resolutions of 1798* (New York, 1887); Freeman Snow, *Treaties and Topics in American Diplomacy* (Boston, 1894); J. B. Moore, *A Digest of International Law* (6 vols., Washington, 1906), and *History and Digest of the International Arbitrations to which the United States has been a Party* (6 vols., Washington, 1898); E. S. Maclay, *History of the United States Navy from 1775 to 1894* (3 vols., New York, 1897–1902); G. W. Allen, *Our Navy and the Barbary Corsairs* (Boston, 1905); J. R. Spears, *History of our Navy* (4 vols., New York, 1897); D. R. Dewey, *Financial History of the United States* (New York, 1903); W. G. Sumner, *History of Banking in the United States* (New York, 1896); R. C. H. Catterall, *The Second Bank of the United States* (Chicago, 1903); F. W. Taussig, *Tariff History of the United States* (4th ed., New York, 1898); E. L. Bogart, *Economic History of the United States* (New York, 1907); E. D. Fite, *Social and Industrial Conditions in the North during the Civil War* (New York, 1910), and J. L. Bishop, *History of American Manufactures* (3 vols., 3rd ed., Philadelphia, 1867). For biographies of the leading statesmen of the period see *American Statesmen*, edited by J. F. Morse, jun. (32 vols., new ed., Boston, 1899); see also the bibliographies at the close of the biographical sketches of statesmen in this edition of the *Ency. Brit.* There is a "Critical Essay on Authorities" in each volume of *The American Nation*; and both *The Literature of American History*, edited by J. N. Larned (Boston, 1902), and Channing and Hart's *Guide to the Study of American History*, are valuable bibliographical guides. (A. J.; C. C. W.)

L.—*History, 1865–1910.*

257. The capitulation of Lee (April 9, 1865), followed by the assassination of Lincoln (April 15) and the surrender of the last important Confederate army, under J. E. Johnston, marked the end of the era of war and the beginning of that of Reconstruction, a problem which involved a revolution in the social and political structure of the South, in the relation of state and nation in the American Federal Union, and in the economic life of the whole country.

258. Economically the condition of the South was desperate. The means of transport were destroyed; railways and bridges were ruined; Southern securities were valueless; the Confederate currency system was completely disorganized. Great numbers of the emancipated negroes wandered idly from place to place, trusting the Union armies for sustenance, while their former masters toiled in the fields to restore their plantations.

Social and Economic Condition of the South.

259. The social organization of the South had been based on negro slavery. Speaking generally, the large planters had constituted the dominant class, especially in the cotton states; and in the areas of heaviest negro population these planters had belonged for the most part to the old Whig party. Outside of the larger plantation areas, especially in the hill regions and the pine barrens, there was a population of small planters and poor whites who belonged in general to the Democratic party. In the mountain regions, where slavery had hardly existed, there were Union areas, and from the poor whites of this section had come Andrew Johnson, senator and war governor of Tennessee, who was chosen vice-president on the Union ticket with Lincoln in 1864 as a recognition of the Union men of the South. Accidental as was Johnson's elevation to the presidency, there was an element of fitness in it, for the war destroyed the former ruling class in the Southern States and initiated a democratic revolution which continued after the interregnum of negro government. Of this rise of the Southern masses Johnson was representative.

Distrust of President Johnson.

260. The importance of personality in history was clearly illustrated when the wise and sympathetic Lincoln, who had the confidence of the masses of the victorious North, was replaced by Johnson, opinionated and intemperate, whose antecedents as a Tennessean and Democrat, and whose state rights' principles and indifference to Northern ideals of the future of the negro made him distrusted by large numbers of the Union Republican party.

Union Republican Party.

261. The composition of this party was certain to endanger its stability when peace came. It had carried on the war by a coalescence of Republicans, War Democrats, Whigs, Constitutional Unionists and Native Americans, who had rallied to the cause of national unity. At the outset it had asserted that its purpose was not to interfere with the established institutions in slave states, but to defend the Constitution, and to preserve the Union with all the dignity, equality and rights of the several states unimpaired. But the war had destroyed slavery, as well as preserved the Union, and the civil status of the negro and the position of the revolted states now became burning questions, reviving old antagonisms and party factions. To the extremists of the Radical wing it seemed in accordance with

the principles of human liberty that the negro should not only be released from slavery but should also receive full civil rights, including the right to vote on an equality with the whites. This group was also ready to revolutionize Southern society by destroying the old ascendancy of the great planter class. Of this idealistic school of radical Republicans, Charles Sumner, of Massachusetts, was the spokesman in the Senate, and Thaddeus Stevens, of Pennsylvania, in the House.

262. For many years before the war parties had differed on such important questions as the tariff, internal improvements and foreign policy; and the South had used its alliance with the Northern Democracy to resist the economic demands of the industrial interests of the North. A return of Southern congressmen, increased in numbers by the inapplicability to the new conditions of the constitutional provision by which they had representation for only a fraction of the slaves, might mean a revival of the old political situation, with the South and the Northern Democracy once more in the saddle.

263. Any attempt to restore the South to full rights, therefore, without further provision for securing for the freedmen the reality of their freedom, and without some means of establishing the political control of the victorious party, would create party dissension. Even Lincoln had aroused the bitter opposition of the radical leaders by his generous plan of Reconstruction. Johnson could have secured party support only by important concessions to the powerful leaders in Congress; and these concessions he was temperamentally unable to make. The masses of the North, especially in the first rejoicings over the peace, were not ungenerous in their attitude; and the South, as a whole, accepted the results of defeat in so far as to acquiesce in the permanence of the Union and the emancipation of the slaves, the original issues of the war.

Northern Attitude towards the South.

264. In the settlement of the details of Reconstruction, however, there were abundant opportunities for the hatred engendered by the war to flame up once more. As it became clear that the Northern majority was determined to exclude the leaders of the South from political rights in the reconstruction of the Union, and especially as the radicals disclosed their purpose to ensure Republican ascendancy by subjecting the section to the rule of the loyalist whites and, later, to that of the emancipated negroes, good will disappeared, and the South entered upon a fight for its social system. The natural leaders of the people, men of intelligence and property, had been the leaders of the section in the war. Whatever their views had been at first as to secession, the great majority of the Southern people had followed the fortunes of their states. To disfranchise their leaders was to throw the control into the hands of a less able and small minority of whites; to enfranchise the blacks while disfranchising the white leaders was to undertake the task of subordinating the former political people of a section to a different race, just released from slavery, ignorant, untrained, without property and fitted only to follow the leadership of outside elements. The history of this attempt and its failure constitutes much of that of the Reconstruction.

265. These underlying forces were in reality more influential than the constitutional theories which engaged so much of the discussion in Congress, theories which, while they afford evidence of the characteristic desire to proceed constitutionally were really urged in support of, or opposition to, the interests just named.

266. The most extreme northern Democrats, and their southern sympathizers, starting from the premise that constitutionally the Southern states had never been out of the Union, contended that the termination of hostilities restored them to their former rights in the Federal Union unimpaired and without further action. This theory derived support from President Lincoln's view that not states, but assemblages of individuals, had waged war against the government. The theory of the extreme Republican Radicals was formulated by Sumner and Stevens. The former contended that, while the states could not secede, they had by waging war reduced themselves to mere Territories of the United States, entitled only to the rights of Territories under the Constitution. Stevens went further and, appealing to the facts of secession, declared the Southern states conquered provinces, subject to be disposed of under international law at the will of the conqueror. In the end Congress adopted a middle ground, holding that while the states could not leave the Union, they were, in fact, out of normal relations, and that the constitutional right of the Federal government to guarantee republican governments to the various states gave to Congress the power to impose conditions precedent to their rehabilitation.

Theories Regarding the Status of the Southern States.

267. It is necessary to recall the initiation of Reconstruction measures by President Lincoln rightly to understand the position which was taken by President Johnson. Impatient of theoretical discussion, Lincoln laid down practical conditions of restoration in his proclamation of the 8th of December 1863. In this he offered amnesty to those who would take an oath of loyalty for the future and accept the acts of Congress and the proclamation of the president with reference to slaves. From the amnesty he excepted the higher military, civil and diplomatic officers of the Confederacy as well as those who had relinquished judicial stations, seats in Congress, or commissions in the army or navy to aid the rebellion, and those who had treated persons in the Federal service otherwise than lawfully as prisoners of war. The proclamation provided, further, that when in any of the seceding states (except Virginia, where the president had already recognized the loyal government under Governor Francis H. Pierpont) a number of persons not less than one-tenth of the voters in 1860 should have taken the above described oath, and, being qualified voters under the laws of the state in 1860, should have established a state government, republican in form, it should be recognized. Lincoln's comprehension of Southern difficulties was shown in his declaration in this proclamation that the president would not object to such provisions by the states regarding the freedmen as should, while declaring their freedom and providing for their education, recognize their condition as a labouring, landless and homeless class.

President Lincoln's Policy.

268. Although Lincoln expressly pointed out that the admission of the restored states to representation in Congress rested exclusively with the respective houses, and announced his readiness to consider other plans for Reconstruction, heated opposition by the radicals in Congress was called out by this proclamation. They feared that it did not sufficiently guarantee the abolition of slavery, which up to this time rested on the war powers of the president, and they asserted that it was the right of Congress, rather than that of the president, to determine the conditions and the process of Reconstruction. In a bill which passed the House by a vote of 73 to 59 and was concurred in by the Senate, Congress provided that Reconstruction was to be begun only when a majority of the white male citizens of any one of the Confederate States should take oath to support the Constitution of the United States. The president should then invite them to call a constitutional convention. The electors of this convention would be required to take an oath of allegiance which excluded a much larger class than those deprived of the benefit of the amnesty proclamation, for it eliminated all who had voluntarily borne arms against the United States, or encouraged hostility to it, or voluntarily yielded support to any of the Confederate governments. In addition to entrusting the formation of a constitution to the small minority of thorough-going loyalists, the bill required that the state constitution should exclude a large proportion of the civil and military officers of a Confederate government from the right of voting, and that it should provide that slavery be for ever abolished and that state and Confederate debts of the war period should never be paid. In July 1864 Lincoln gave a "pocket veto" to the bill and issued a proclamation explaining his reasons for refusing to sign, whereupon Benjamin F. Wade and Henry W. Davis (*q.v.*), leaders of

Attitude of Congress; the First Reconstruction Bill.

the radicals, violently attacked the president. The triumph of Lincoln in the election of 1864 did not clearly signify the will of the people upon the conditions of Reconstruction, or upon the organ of government to formulate them, for the declaration of the Democratic convention that the war was a failure overshadowed the issue, and the Union party which supported Lincoln was composed of men of all parties.

269. On January 31st 1865 the House concurred in the vote of the Senate in favour of the Thirteenth Amendment to the Constitution abolishing slavery throughout the Union. Four years earlier Congress had submitted to the states another Thirteenth Amendment by the terms of which no amendment should ever authorize Congress to interfere with slavery within the states. But owing to the war this amendment had remained unratified, and now Congress proposed to place beyond constitutional doubt, or the power of states to change it, the emancipation of slaves. By the 18th of December 1865 the amendment had been ratified and was proclaimed in force.

Thirteenth Amendment.

270. In the meantime, Louisiana, in accordance with Lincoln's proclamation, had adopted a constitution and abolished slavery within the state. Owing to the obstructive tactics of Sumner, aided by Democrats in the Senate, Congress adjourned on the 4th of March 1865 without having recognized this new state government as legitimate. "If we are wise and discreet," said Lincoln, "we shall reanimate the states and get their governments in successful operation with order prevailing and the Union re-established before Congress comes together in December."

271. Such was the situation when Johnson took up the presidency upon Lincoln's death. After an interval of uncertainty, in which he threatened vengeance against various Southern leaders and gave the radicals some hope that he would favour negro suffrage, President Johnson accepted the main features of Lincoln's policy. Congress not being in session, he was able to work out an executive Reconstruction on the lines of Lincoln's policy during the summer and autumn of 1865. On the 29th of May he issued a proclamation of amnesty, requiring of those who desired to accept its provisions an oath to support the Constitution and Union, and the laws and proclamations respecting the emancipation of slaves. Certain specified classes of persons were excepted, including certain additions to those excluded by Lincoln, especially "all persons who have voluntarily participated in said rebellion and the estimated value of whose taxable property is over twenty thousand dollars." This provision was characteristic of Johnson, who disliked the Southern planting aristocracy, and aimed at placing the preponderant power in the hands of the Democratic small farmers, who had been his supporters. To those of the excepted classes who would ask pardon from the president, he promised a liberal clemency. As part of his system he issued another proclamation in which he appointed a governor for North Carolina and laid down a plan for Reconstruction. By this proclamation it was made the duty of the governor to call a convention chosen by the loyal people of the state, for the purpose of altering the state constitution and establishing a state government. The right to vote for delegates to this convention was limited to those who had taken the oath of amnesty and who had been qualified to vote prior to the secession of the state. To the state itself was to be left the determination of the future qualifications of electors and office-holders.

Policy of President Johnson.

272. Already Virginia, Tennessee, Louisiana and Arkansas had governments which had been recognized by Lincoln. Between the 13th of June and the 13th of July 1865 Johnson applied the same process which he had outlined for North Carolina to the remaining states of the Confederacy. Before Congress met in December all the Confederate states, except Texas (which delayed until the spring of 1866), had formed constitutions and elected governments in accordance with the presidential plan. All of their legislatures, except that of Mississippi, ratified the Thirteenth Amendment abolishing slavery.

273. Gradually, however, the South turned to its former leaders to shape its policy, and the radical Republicans of the North were alarmed at the rapidity of the process of restoration on these principles. The disorganized and idle condition of the former slaves constituted a serious element in the Southern situation, as Lincoln had foreseen. The negroes expected a grant of land from confiscated Southern estates, and it was difficult to preserve order and to secure a proper labour supply.

274. Under these conditions the efforts of the South to provide security for their communities by bodies of white militia were looked upon with apprehension by the North, and there was sufficient conflict between the two races to give colour to charges that the South was not accepting in good faith the emancipation of the slaves. Especially irritating to Northern sentiment were the so-called "black codes" or "peonage laws," passed by the newly elected Southern legislatures. They rested on the belief that it was necessary that the former slaves should be treated as a separate and dependent class, and varied in severity in the different states. Some of these imposed special disabilities upon the negro in the matter of carrying weapons and serving as witnesses. Vagrancy laws and provisions regarding labour contracts which had precedents in colonial and English legislation, but were specifically framed to restrain the negroes only, were common. Mississippi denied them the right to own land, or even to rent it outside of incorporated towns; South Carolina restricted them to husbandry and to farm or domestic service, unless specially licensed. Although several of the Southern states, perceiving that their course was likely to arouse the North to drastic measures, repealed or mitigated the most objectionable laws, the North had received the impression that an attempt had been made to restore slavery in disguised form.

Southern "Black Codes."

275. The problem of succouring and protecting the negroes had forced itself upon the attention of the North from the beginning of the war, and on the 3rd of March 1865 Congress had created the Freedmen's Bureau (*q.v.*), with the power to assign abandoned lands, in the states where the war had existed, to the use of the freedmen; to supervise charitable and educational activities among them; to exercise jurisdiction over controversies in which a freedman was a party; and to regulate their labour contracts. The local agents of the bureau were usually Northern men; some of them gave the worst interpretation to Southern conditions and aroused vain hopes in the negroes that the lands of the former masters would be divided among them; and later many of them became active in the political organization of the negro.

The Freedmen's Bureau.

276. Although the national government itself had thus recognized that special treatment of the freedmen was necessary, Congress, on assembling in December 1865, was disposed to regard the course of the South in this respect with deep suspicion. Moreover, as the Thirteenth Amendment was now ratified, it was seen that the South, if restored according to the presidential policy, would return to Congress with added representatives for the freed negroes. Only three-fifths of the negro slaves had been counted in apportioning representatives in Congress; though now free they were not allowed to vote.

277. Under the leadership of the Radicals Congress refused, therefore, to receive the representatives of the states which had met the conditions of the president's proclamations. A joint committee of fifteen took the whole subject of Reconstruction under advisement, and a bill was passed continuing the Freedmen's Bureau indefinitely. When this was vetoed by President Johnson (Feb. 19, 1866) Congress retaliated by a concurrent resolution (March 2) against admitting any reconstructed state until Congress declared it entitled to recognition, thus asserting for the legislative body the direction of Reconstruction.

278. While the measure was under consideration the president in an intemperate public address stigmatized the leaders of the radicals by name as labouring to destroy the principles

of the government and even intimated that the assassination of the president was aimed at. It was hardly possible to close the breach after this, and the schism between the president and the leaders of the Union Republican party was completed when Congress passed (April 9, 1866) the Civil Rights Bill over Johnson's veto. The act declared the freedmen to be citizens of the United States with the same civil rights as white persons and entitled to the protection of the Federal government. It provided punishment for those who, relying upon state authority, should discriminate against the negroes.

Breach between the President and Congress; the Civil Rights Bill.

279. To place this measure beyond the danger of overthrow by courts, or by a change of party majority, on the 13th of June 1866 Congress provided for submitting to the states a Fourteenth Amendment to the Constitution. This gave constitutional guarantee of citizenship and equal civil rights to freedmen, and, in effect, provided that when in any state the right to vote should be denied to any of the male inhabitants twenty-one years of age and citizens of the United States, except for participation in rebellion or other crime, the basis of representation in the state should be reduced in the proportion which the number of such citizens bore to the whole number of male citizens twenty-one years of age in the state. This section of the amendment, therefore, left the states the option between granting the suffrage to the negro or suffering a proportionate reduction in the number of representatives in Congress. It was a fair compromise which might have saved the South from a long period of misrule and the North from the ultimate breakdown of its policy of revolutionizing Southern political control by enfranchisement of the blacks and disfranchisement of the natural leaders of the whites. But the South especially resented that section of the amendment which disqualified for Federal or state office those who, having previously taken an oath to support the Constitution of the United States, afterwards engaged in rebellion, which involved the repudiation of their leaders. The amendment further safeguarded the validity of the United States debt and declared null the war debt of the seceding states and the Confederacy and forbade the payment of claims for emancipation.

The Fourteenth Amendment.

280. In order to ensure the passage of this amendment the Radical leaders proposed bills which declared that, after its adoption, any of the seceding states which ratified it should be readmitted to representation. But it also provided that the higher classes of officials of the Confederacy should be ineligible to office in the Federal government. These bills were allowed to await the issue of the next election.

281. For further protection of the rights of the negro, Congress succeeded in passing, over President Johnson's veto, an act continuing the Freedmen's Bureau for two years. Tennessee having ratified the Fourteenth Amendment was (July 24, 1866) restored to representation and Congress adjourned, leaving the issue between the president and the legislative body to the people in the Congressional elections.

282. The campaign brought with it some realignment of party. President Johnson having broken with the leaders of the Union Republican party was more and more forced to rely upon Democratic support, although his executive appointments were still made from the ranks of the Republicans. The so-called National Union Convention, which met in Philadelphia in midsummer in an effort to abate sectionalism, and to endorse the president's policy, included a large number of War Democrats who had joined the Union party after the secession of the South, many moderate Southerners, a fragment of the Republican party, and a few Whigs, especially from the Border states. They claimed that the southern States had a right to be represented in Congress. Other meetings friendly to the Radicals were called, and under the designation of Union-Republican party they declared for the Congressional policy. While the campaign for elections to Congress was in progress the president made a journey to Chicago, speaking at various cities *en route* and still further alienating the Republicans by coarse abuse of his opponents. As a result of the autumn elections two-thirds of the members of the House of Representatives were opposed to him. Almost contemporaneously every seceding state except Tennessee rejected the Fourteenth Amendment, and thereby paved the way for the entire triumph of the Northern extremists, who favoured negro suffrage on idealistic grounds or as a means for forcing the South to agree to the Republican policy.

Party Realignments.

283. In the ensuing winter and spring Congress completed the conquest of the president, awed the Supreme Court, and provided a drastic body of legislation to impose negro suffrage on the South. By the Tenure of Office Act (March 2, 1867) Congress forbade the president to remove civil officers without the consent of the Senate, and at the same time by another act required him to issue military orders only through the general of the army (Grant), whom the president was forbidden to remove from command or to assign to duty at another place than Washington, unless at the request of the officer or by the prior assent of the Senate. These extraordinary invasions of the presidential authority were deemed necessary to prevent Johnson from securing control of the military arm of the government, and to protect Edwin Stanton, the secretary of war, and General Grant. Fearing lest the president might take advantage of the interim during which Congress would not be in session, the Fortieth Congress was required to meet on the 4th of March immediately following the expiration of the thirty-ninth.

Tenure of Office Act.

284. The Reconstruction Act of the 2nd of March 1867 provided for the military government of the Southern states while the drastic policy of Congress was being carried out. It was passed over the veto of the president and declared that no legal governments or adequate protection for life or property existed in the seceding states, except Tennessee. These states it divided into five military districts, each to be placed under the command of a general of the army, whose duty it was to preserve law and order, using at discretion either local civil tribunals or military commissions. But the existing civil governments were declared provisional only and subject to the paramount authority of the United States to abolish, modify, control, or supersede them. The act further provided that a constitutional convention might be elected by the adult male citizens of the state, of whatever race, colour or previous condition, resident in the state for a year, except such as might be disfranchised for rebellion or felony. No persons excluded from holding office under the Fourteenth Amendment were eligible for election to the convention or entitled to vote for its members.

Reconstruction Act of March 2, 1867.

285. When the convention, thus chosen under negro suffrage, and with the exclusion of Confederate leaders, should have framed a state constitution conforming to the Federal Constitution and allowing the franchise to those entitled to vote for the members of the convention, the constitution was to be submitted for the approval of Congress. If this were obtained and if the state adopted the Fourteenth Amendment, and this amendment became a part of the Federal Constitution, then the state should be entitled to representation in Congress; but the senators and representatives sent to Congress were required to take the "iron-clad oath," which excluded those who had fought in the Confederate service, or held office under any government hostile to the United States, or given support to any such authority.

286. By the pressure of military control Congress thus aimed at forcing the adoption of the Fourteenth Amendment, as well as the acceptance of negro suffrage in the state constitutions of the South. A supplementary act of the 23rd of March 1867 and an act of interpretation passed on the 19th of July completed this policy of "thorough." In the registration of voters the district commanders were required to administer an oath which excluded those disfranchised for rebellion and those who after holding state or Federal office had given aid and comfort to the enemies of the United States.

Supplementary Acts.

287. Against this use of military power to govern states in

time of peace the Supreme Court interposed no effective obstacle. Like the executive it was subordinated to Congress. It is true that in the case *ex parte Milligan*, decided in December 1866, the court held military commissions unlawful where the ordinary civil tribunals were open. In the case of *Cummings* v. *Missouri* (Jan. 14, 1867) it decided also that a state test oath excluding Confederate sympathizers from professions was a violation of the prohibition of *ex post facto* laws; and the court (*ex parte Garland*) applied the same rule to the Federal test oath so far as the right of attorneys to practise in Federal courts was concerned.

Supreme Court Decisions.

288. But threats were made by the radicals in Congress to take away the appellate jurisdiction of the court, and even to abolish the tribunal by constitutional amendment. The judges had been closely divided in these cases and, when the real test came, the court refused to set itself in opposition to Congress. When Mississippi attempted to secure an injunction to prevent the president from carrying out the Reconstruction acts, and when Georgia asked the court to enjoin the military officers from enforcing these acts in that state, the Supreme Court refused (April and May 1867), pleading want of jurisdiction. Chief Justice Salmon P. Chase argued that if the president refused to obey the court could not enforce its decree, while if he complied with the order of the court, and if the House of Representatives impeached him for refusing to enforce the law, the Supreme Court would be forced to the vain attempt to enjoin the Senate from sitting as a court of impeachment.

289. In one instance it seemed inevitable that the court would clash with Congress; the *McCardle case* involved an editor's arrest by military authority for criticizing that authority and the Reconstruction policy. But Congress, apprehending that the majority of the court would declare the Reconstruction acts unconstitutional, promptly repealed that portion of the act which gave the court jurisdiction in the case, and thus enabled the judges to dismiss the appeal. Afterwards, when the Reconstruction policy had been accomplished, the court, in the case of *Texas* v. *White* (1869), held that the Constitution looked to "an indestructible Union composed of indestructible states"; and that although the secession acts were null, and the Federal obligations of the seceding states remained unimpaired, yet their rights were suspended during the war. It also held that in re-establishing the broken relations of the state with the Union, Congress, under the authority to guarantee to every state a republican form of government, was obliged to regard the freedmen as part of the people of the state, and was entitled to decide what government was the established one. This decision, though it did not involve the direct question of the constitutionality of the Reconstruction acts, harmonized with the general doctrines of the Congressional majority.

McCardle Case.

Texas v. White.

290. The powerful leaders of the Republicans in Congress had been awaiting their opportunity to rid themselves of President Johnson by impeachment. After various failures to convince a majority of the House that articles should be preferred against him, an opportunity seemed to present itself when Johnson, in the summer recess of 1867, suspended Secretary Stanton and made General Grant the acting secretary of war. The Senate, on reassembling, refused to consent to the suspension, and General Grant yielded his office to Stanton, thus spoiling the president's plan to force Stanton to appeal to the courts to obtain his office and so test the constitutionality of the Tenure of Office Act. This proved to be a turning-point in Grant's political career, for by his break with Johnson he gained new support among the masses of the Republican party. To Johnson's foes it seemed that the president had delivered himself into their hands when he next defied Congress by taking the decisive step of removing Stanton in defiance of the Tenure of Office Act, and the House announced to the Senate (Feb. 25, 1868) its decision to bring articles of impeachment against the president. But careful reading of the law showed that it could not be relied on as conclusive ground for impeachment, for it provided that cabinet officers should hold office during the term of the president by whom they were appointed and for one month thereafter, subject to removal with the consent of the Senate. As Stanton had been appointed by President Lincoln and had merely continued under Johnson, a doubtful question was raised. The leaders, therefore, incorporated additional charges in the articles of impeachment which they pushed through the House of Representatives. By these the president was accused of attempting to bring the legislative branch into disgrace by his public utterances and of stigmatizing it as a Congress of only part of the states. This raised the question whether it was necessary to show a legal, technical crime or misdemeanour as the necessary ground of impeachment. Had the theory of the leaders that this was not the case been successful, the executive would have been reduced to an obvious dependence upon Congress. In the spring of 1868, however, the trial by the Senate resulted in a verdict of acquittal. (See JOHNSON, ANDREW.)

Impeachment of President Johnson.

Acquittal by the Senate.

291. Meanwhile the military Reconstruction of the South and the organization of the negro vote progressed effectively. The party management of the negroes was conducted by "carpet-baggers," as the Northern men who came South to try their fortunes under these new conditions were nicknamed, and by the white loyalists of the South, to whom was given the name "scalawags." In the work of marshalling the freedmen's vote for the Republican party secret societies like the Loyal League, or Union League (*q.v.*), played an important part. As the newly enfranchised mass of politically untrained negroes passed under Northern influence politically, the Southern whites drew more and more together in most of the former Confederate States, and although they were unable under the existing conditions to take control, they awaited their opportunity. A "Solid South" was forming in which old party divisions gave way to the one dominant antagonism to Republican ascendancy by negro suffrage; and a race antagonism developed which revealed the fact that underneath the slavery question was the negro question.

"Carpet-baggers" and "Scalawags"; the Union League.

292. Politically the important fact was that the Republicans had rejected the possibility of reviving the old party lines in the South, and had gambled upon the expectation of wielding the united coloured vote with such leadership and support as might be gained from former Northerners and loyal whites. In the end negro rule failed, as was inevitable when legal disabilities and military force were removed; but the masses of the Southern whites emerged with a power which they had not possessed under the old rule of the planting aristocracy. For the time being, however, negro votes gave control to the Republicans. In South Carolina, Florida, Alabama, Mississippi and Louisiana the negroes were in a majority; in Virginia, North Carolina, Arkansas and Texas they were in the minority; while in Georgia the two races were nearly evenly balanced.

293. The white leaders of the South were divided as to the best means of meeting the problem. Some advocated that those entitled to vote should register, and then refrain from the polls, in order to defeat the constitutions made under negro suffrage, for the law required them to be ratified by a majority of the qualified voters. Others would have the white race bear no part in the process. Societies such as the "Ku-Klux Klan" and the "Knights of the White Camelia" were organized to intimidate or restrain the freedmen. But for the present the Republicans carried all before them in the South. Some of the new state constitutions imposed severe disfranchisement upon the former dominant class, and before the end of July 1868 all of the former Confederate States, except Virginia, Mississippi and Texas, had ratified the Fourteenth Amendment, which was proclaimed in effect. By the beginning of 1870 these three states had also ratified the amendment, as had

Policy of the South; the Ku-Klux Klan.

Georgia a second time, because of her doubtful status at the time of her first ratification.

294. By the summer of 1868 Arkansas, South Carolina, North Carolina, Georgia, Alabama, Louisiana and Florida, having satisfied the requirements of the Reconstruction acts, were entitled to representation in Congress. But Georgia did not choose her senators until after the adjournment of Congress, and, inasmuch as the state excluded the negro members of the legislature in September, Congress on reassembling returned the state to military rule until its submission. Alabama was restored in spite of the fact that her white voters had remained away from the polls in sufficient numbers to prevent a majority of all the voters registered from having ratified the constitution of the state, as the Reconstruction acts had required. The nominating conventions and the campaign of 1868 gave interesting evidence of the trend of political and economic events. Party lines, which had broken down in the North when all united in saving the Union, were once more reasserting themselves. President Johnson, who had been elected by the Union Republican party, had found his most effective support among the Democrats. The Republicans turned to General Grant, a Democrat before the outbreak of the war. His popularity with the Republicans was due not only to his military distinction, but also to his calm judgment in the trying period of the struggle between the president and Congress. He was seriously considered by the Democrats until he broke with Johnson in the Stanton episode.

Six Southern States Restored to the Union.

295. The Republican nominating convention met on the 20th of May 1868, a few days after the failure of the impeachment proceedings, and it chose Grant as the candidate for the presidency. The platform supported the Congressional Reconstruction measures. Upon the vital question whether universal negro suffrage should be placed beyond the power of states to repeal it by a new constitutional amendment, the platform declared: "The guarantee by Congress of equal suffrage to all loyal men at the South was demanded by every consideration of public safety, of gratitude and of justice, and must be maintained; while the question of suffrage in all the loyal states properly belongs to the people of those states." Nowhere in the North was the negro an important element in the population, but the North had shown an unwillingness to apply to itself the doctrines of negro rights which had been imposed upon the South. Between 1865 and 1868 Connecticut, Wisconsin, Minnesota, Kansas, Ohio and Michigan had refused to give the negro the right to vote within their own bounds, and this plank was evidence of the unwillingness of the party to make a direct issue of universal negro suffrage. Although the platform failed to indicate the future proposals of the Republican leaders on the negro question, on the topics of finance and currency it clearly showed that the party was controlled by economic interests which were to exercise increasing influence upon it. It pronounced in favour of payment of the public debt, not only according to the letter but the spirit of the laws under which it was contracted. The significance of this lay in its challenge to the Democratic agitation on the currency question.

National Republican Convention; Grant Nominated for the Presidency.

296. It was this question which gave the tone to the proceedings of the Democracy at their convention in July 1868. The situation can best be presented by a brief review of the financial history just preceding the convention. Together with the discussion over political Reconstruction in the South, Congress and the administration had been obliged to deal with the reconstruction of debt, taxation and currency in the nation at the close of four years of expensive war. At its maximum point the debt had risen to $2,758,000,000, of a complicated variety of forms, and of the total less than one-half was funded. The problems of funding, readjustment of taxation, and resumption of specie payments proved to be so complicated with the industrial growth of the nation that they led to issues destined to exert a long continued influence.

297. The various war tariffs, passed primarily for the sake of increased revenue, had been shaped for protection under the influence of the manufacturing interests, and they had been framed also with reference to the need of compensating the heavy internal taxes which were imposed upon the manufacturers. When the war ended public sentiment demanded relief from these heavy burdens, and especially from the irksome internal taxes. The rapidly growing grain-raising districts of the Middle West exhibited a lively discontent with the protective tariff, but this did not prevent the passage in 1867 of the Wool and Woollens Act, which discriminated in favour of the woollen manufacturers and raised the *ad valorem* duty on wool. In spite of several large reductions of internal revenue, the national debt was being extinguished with a rapidity that only a prosperous and growing nation could have endured.

Finance; the Tariff; Internal Revenue.

298. The currency question, however, furnished the economic issue which was most debated in the period of Reconstruction. One set of interests aimed at rapidly reducing the volume of the currency by retiring the legal tender notes, or "greenbacks," issued during the war, on the ground that they had been provided only as a war measure, that the country needed a contraction of this currency, and that specie payments would be hastened by the withdrawal of the greenbacks. The secretary of the treasury, Hugh McCulloch, pressed this policy to the foreground, and desired authority to issue bonds to retire these notes. Another set of interests demanded the retention of the greenbacks, supporting their views by arguments varying according to the degree of radicalism of the speakers. The more moderate, like Senator John Sherman, of Ohio, who reflected the views of parts of the West, argued that the recuperation of the nation and the rapid increase of business would absorb the existing currency, while gold would cease to go abroad. Thus, by the increasing credit of the government, specie payment would be automatically resumed, and the holders of currency certificates would convert them into coin obligations at a lower interest rate. Others wished to use the greenbacks to pay the principal of such of the bonds as did not explicitly specify coin as the medium of payment; the most extreme, so far from contracting the currency by retiring the greenbacks, wished to increase this form of money, while diminishing the circulation of the notes of the national banks. The discussion tended to produce a sectional issue with the West against the East, and a social issue with bondholders and the creditor class in general arrayed against the less well-to-do. Congress agreed with Secretary McCulloch, and in the Funding Act of 1866 not only provided for converting short-time securities into long-term bonds, but also for retiring ten million dollars of greenbacks in six months and thereafter not more than four millions monthly. But the agricultural depression of 1866 produced a reaction. Loud demands were made that bonds should be paid in greenbacks instead of coin, that United States securities should be taxed, and the national bank notes suppressed. In 1868, on the eve of the presidential campaign, Congress, alarmed by the extent of these popular demands, suspended the process of contraction by decisive majorities in both houses, after forty million dollars in greenbacks had been retired by the secretary of the treasury.

The Currency Question; "Greenbacks."

299. Ohio was the storm centre of the agitation. The "Ohio idea" that greenbacks should become the accepted currency of the country was championed by George H. Pendleton, of that state, and his friends now brought him forward for the Democratic nomination for president on this issue. In the national convention of that party they succeeded in incorporating into the platform their demands that there should be one currency for the government and the people, the bondholder and the producer, and that where the obligations of the government did not expressly provide for payment in coin, they should be paid in lawful money (*i.e.* greenbacks) of the United States.

The "Ohio idea."

300. But another wing of the Democratic party desired to

make prominent the issue against the Reconstruction measures of the Republicans. This wing added to the platform and declaration that these acts were unconstitutional and void, and the demand that the Southern states should be restored to their former rights and given control over their own elective franchise.

301. Although the followers of Pendleton had shaped the financial plank of the platform, they could not nominate their leader. The opposition was at first divided between the various candidates. New York, which feared the effect upon the conservative financial interests of the East if Pendleton were nominated, attempted to break the deadlock by proposing an Ohio man, Chief Justice Chase. But eager as Chase was for the presidency he had flatly refused to abandon the views which he held in favour of negro suffrage. Ohio was, therefore, able to retaliate by stampeding the convention in favour of Horatio Seymour, of New York, chairman of the convention. As the war governor of his state he had been a consistent critic of the extremes to which the Federal administration had carried its interpretation of the war power. For vice-president the convention nominated Francis P. Blair, jun., of Missouri, who had denounced the unconstitutionality of the Reconstruction acts in unmeasured terms.

National Democratic Convention; Seymour Nominated for the Presidency.

302. But the popularity of Grant in the North, together with the Republican strength in the states of the South which had been reconstructed under negro suffrage, gave an easy victory to the Republicans in the election of 1868. Seymour carried only Delaware, New Jersey, New York and Oregon, of the North; and Maryland, Kentucky, Georgia and Louisiana of the South. Tennessee, and five of the former Confederate States, upon which negro suffrage had been imposed under military Reconstruction (North Carolina, South Carolina, Florida, Alabama and Arkansas) voted for Grant. Virginia, Mississippi and Texas had not yet been restored.

Grant Elected.

303. This decisive victory and the knowledge that it had been won by the advantage of the negro vote in the restored states led the Republican leaders to ignore their recent platform declaration in regard to negro suffrage. Shortly after Congress assembled propositions were made to place the freedman's right to vote beyond the power of the states to change. To do this by constitutional enactment it was necessary to make the provision universal, and Congress, therefore, submitted for ratification the Fifteenth Amendment declaring that "the right of citizens of the United States to vote shall not be denied or abridged by the United States or by any state on account of race, color or previous condition of servitude." Congress was given power to enforce the amendment by appropriate legislation. By the 30th of March 1870 the amendment had been ratified; but it is doubtful whether this could have been accomplished by legislatures chosen on the issue. As it was, the states of Virginia, Mississippi, Texas and Georgia were required to ratify it as a condition of their readmittance to representation in Congress, and the three former states, having been permitted to vote separately on the obnoxious provisions of their constitutions in regard to the disfranchisement of former Confederates, rejected those clauses, adopted the Fifteenth Amendment and were restored in 1870. Georgia, after a new experience of military rule, likewise ratified the amendment, and her representatives were likewise admitted to Congress.

Fifteenth Amendment.

Georgia Re-admitted.

304. As soon as the Fifteenth Amendment was proclaimed in effect, and the military governments of the South were superseded, the dominant party proceeded to enact measures of enforcement. These seemed especially necessary in view of the fact that, partly by intimidation of the coloured vote, Louisiana (1868) and Tennessee (1869) broke away from the Republican column; while in the election of 1870 Tennessee, North Carolina, Georgia, Virginia and Alabama went Democratic. The enforcement legislation of 1870 provided penalties for violating the Fourteenth and Fifteenth amendments and re-enacted the Civil Rights Act of 1866. Jurisdiction was given to the Federal courts to maintain the equality of the races before the law. The underlying doctrine of the acts was that the amendments guaranteed the freedmen against invasion of their rights by the acts of individuals as well as by explicit legislation of the states. In the next two years (1871 and 1872) acts were passed providing for effective Federal supervision of Congressional elections, and the "Ku-Klux Acts" (1871 and 1872) still further increased the power of the Federal courts to enforce the amendments and authorized the president to suspend the writ of *habeas corpus* and use military force to suppress the public disorders occasioned by the attempts to intimidate negro voters. But these stern measures were accompanied by some efforts to restore harmony, such as the repeal of the "iron-clad oath" for ex-Confederates, in 1871, and the passage of the General Amnesty Act of 1872. The North was becoming restive under the long continued use of the Federal military arm within state borders in time of peace, and especially with the results of negro rule under "carpet-bag" leadership.

New Congressional Measures.

305. In any case the cost of rehabilitating the public works and providing education and the political and judicial institutions which should equally apply to the hitherto non-political class of the blacks, would have been a heavy one. But the legislatures, especially of Louisiana, South Carolina, Tennessee, Arkansas and Alabama, plunged into an extravagance made possible by the fact that the legislatures contained but few representatives who paid considerable taxes, and that they were controlled by Northern men who were sometimes corrupt, and often indifferent to the burdens laid upon the propertied classes of the South. In 1872 it was estimated that the public debts of the eleven reconstructed states amounted to nearly $132,000,000, two-thirds of which was composed of guarantees to corporations, chiefly railway companies. Legislative expenses were grotesquely extravagant, the coloured members in some states engaging in a saturnalia of corrupt expenditure. Gradually this alienated from the so-called Radical party the support of Southern whites, because they resented the concessions of the carpet-bag leaders to the negro vote, because they suffered from the burden of taxation, and above all because race friction increased, drawing the whites together, in spite of former antagonisms between localities and classes.

Extravagance of Reconstruction Governments.

306. By 1872 a coalition had been formed under the name of Conservatives. But the control of electoral machinery in the strongly centralized state executives chosen by negro votes, and coercion by the Federal authority, still upheld Republican rule in various Southern states. Virginia and North Carolina were practically bankrupt, the capitals of Louisiana, Arkansas and Alabama, where rival state officers claimed possession, were occupied by Federal troops, and many of the governments were so corrupt that only the contemporaneous revelations of rottenness in New York City and in certain branches of the Federal government afford a parallel.

307. It was a time of lax public morals after war, which was ill suited to the difficult experiment of transferring political power to a race recently enslaved. Only the strong arm of the Federal authority sufficed to prevent the whites of the South from overthrowing a condition of things which it was impossible under American political ideas permanently to maintain.

308. An important economic reorganization was in progress in the South. White districts were recovering from the war and were becoming the productive cotton areas by the use of fertilizers and by the more intelligent white labour. Cities were rising, and the mines and manufactures of the southern Appalachians were developing. In the black belt, or region of denser negro settlement, the old centres of cotton production and the citadels of the Southern political aristocracy, the blacks became tenant farmers, or workers on shares, but the white farmer in other areas raised his cotton at less cost than the planter who lived in the rich soils of the former cotton areas. The effective and just direction of negro labour was a difficult problem and was aggravated by

Economic Changes in the South.

the political agitation which intensified race friction. It became evident that there was a negro problem as well as a slavery question, and that the North was unable to solve it.

309. In the meantime important foreign relations had been dealt with by Secretary William H. Seward, under Johnson; and by Secretary Hamilton Fish, under Grant. Not only were many treaties of commerce and extradition, including one with China, negotiated by Seward, but he also brought about a solution of more important diplomatic problems. The relations of the United States with France and England had been strained in the course of the war, by the evident friendliness of the governments of France and England for the South. Not only had Napoleon III. been inclined to recognize the Confederacy, but he had also taken advantage of the war to throw into Mexico a French army in support of the emperor Maximilian. The temptation to use force while American military prestige was high appealed even to General Grant; but Seward by firm and cautious diplomatic pressure induced France to withdraw her troops in 1867; the power of Maximilian collapsed, and the United States was not compelled to appeal to arms in support of the Monroe Doctrine. Russia's friendly attitude throughout the war was signalized by her offer to sell Alaska to the United States in 1867. Seward promptly accepted it and the treaty was ratified by the Senate and the purchase money ($7,200,000) was voted by the reluctant House, which saw little in the acquisition to commend it. Later years revealed it as one of the nation's treasure houses, particularly of gold and coal.

Foreign Relations.

Maximilian.

Alaska.

310. With England affairs were even more threatening than with France. Confederate cruisers (notably the "Alabama"), built in England and permitted by the negligence of the British government to go to sea, had nearly swept the American merchant marine from the ocean. Unsettled questions of boundary and the fisheries aggravated the ill feeling, and England's refusal in 1865 to arbitrate made a serious situation. Prolonged negotiations followed a change of attitude of England with regard to arbitration, and in 1870 President Grant recommended to Congress that the United States should pay the claims for damages of the Confederate cruisers, and thus assume them against England. However, in 1871, the treaty of Washington was negotiated under Secretary Fish, by the terms of which England expressed regret for the escape of the cruisers and for their depredations, and provided for arbitration of the fisheries, the north-western boundary, and the "Alabama" claims. Senator Sumner had given fiery expression to demands for indirect damage done by the destruction of our merchant marine and our commerce, and for the expenses of prolonging the war. For a time this so aroused the passions of the two nations as to endanger a solution. But Sumner, who quarrelled with the president, was deposed from the chairmanship of the committee on foreign relations, and Secretary Fish so arranged matters that the Geneva arbitration tribunal ruled these indirect claims out. Thus limited, the case of the United States was victorious, the tribunal awarding damages against Great Britain to the amount of $15,500,000. Two months later the German emperor gave to the United States the disputed north-west boundary, including the San Juan island in Puget Sound. The fisheries controversy was not settled until 1877.

The "Alabama" Claims.

San Juan Island.

311. In the West Indies also important questions were presented. Seward had negotiated a treaty of purchase of the Danish West Indies, but the Senate refused to ratify it, nor did Grant's attempt to acquire Santo Domingo meet with a different fate at the hands of that body (1870). In Cuba another insurrection was in progress. Secretary Fish "pigeon-holed" a proclamation of President Grant recognizing the Cubans as belligerents, and secured a policy of neutrality which endured even the shock of the "Virginius affair" in 1873, when fifty of the men of the filibustering steamer flying the American flag were shot by the Spanish authorities (see SANTIAGO, CUBA). It was shown that the vessel had no right to the flag. Negotiations about an isthmian canal resulted only in a treaty with Nicaragua in 1868 giving to the United States a right of way across the isthmus and in provisions for a government survey of the Panama route. Foreign relations in this period were chiefly significant in that they were conducted in a spirit of restraint and that peace was preserved.

Danish West Indies; Santo Domingo.

The "Virginius" Affair.

312. It was in the field of domestic concerns, in economic and social development, that the most significant tendencies appeared. The old issues were already diminishing in importance before the other aspect of Reconstruction which came from the revived expansion of the nation toward the West and the new forms taken by the development of American industrial society.

313. The Republican party, following the traditions of the Whigs, was especially responsive to the demands of the creditor class, who demanded legislation to conserve their interests. Its victory in 1868 was signalized by the passage in the spring of the following year of an act pledging the faith of the United States to pay in coin or its equivalent all the obligations of the United States, except in cases where the law authorizing the issue had expressly provided otherwise. In 1870 and 1871 refunding acts were passed, providing for the issue of bonds to the total amount of $1,800,000,000, one billion of which was to run for thirty years at 4%. This abandonment of the doctrine of early convertibility was made in order to render the bonds acceptable to capitalists, but in fact they soon went to a premium of over 25%. Long before their maturity the government had a surplus, but although it could then borrow at 2½% these bonds could not be retired. While the legislature was thus scrupulous of the credit of the nation and responsive to the views of capital, the Supreme Court was engaged in deciding the question of whether the legal tender notes (greenbacks) were constitutional. Successive decisions in 1868 determined that they were not legal tender for state taxes, that they were exempt from taxation, and that they were not legal tender in the settlement of contracts providing for payment in specie. In the case of *Hepburn* v. *Griswold* (1870) Chief Justice Chase, under whom, as secretary of the treasury, the notes were first issued, gave the opinion of the court denying that they were legal tender in settlement of contracts made before the first Legal Tender Act, and intimating that they were not legal tender for later contracts. The judges had divided, four to three. Within a year the court was changed by the appointment of one new judge to fill a vacancy, and the addition of another in accordance with a law enlarging the court. In 1871 the former decision was reversed and the constitutionality of the Legal Tender Acts sustained on loose-construction reasoning. In 1884 the court went to the extent of affirming the right of Congress to pass legal tender acts in time of peace, in accordance with the usage of sovereign governments, as an incident to the right of coinage, and it declared that the power to borrow money includes the power to issue obligations in any appropriate form. In 1871 and 1872 Secretary George S. Boutwell illustrated the power of the administration to change the volume of the currency, by issuing in all over six million dollars of legal tender notes; and, following the practice of his predecessors, he sold gold from the treasury to check speculations in that part of the currency. The most noteworthy instance of this was in 1869, when two Wall Street speculators, Jay Gould and James Fisk, jun., attempting to corner the gold market and relying upon a supposed influence in the councils of President Grant, ran up the premium on gold until Secretary Boutwell ordered the sale of gold by the government. The result was the financial crash of "Black Friday."

Financial Measures.

314. Speculation and the rapid growth of great fortunes were characteristic of the period. The war itself had furnished means for acquiring sudden riches; the reorganization of taxation, currency and banking increased the opportunities as well as the uncertainties; and the opening of new fields of speculative enterprise in the oil fields of Pennsylvania and Ohio and the gold and silver mines of the mountains of the Far West tended in the

same direction. An enormous development of manufactures resulted from the diminished commerce and increased demand for manufactured goods, the protection afforded by the tariff, the stimulus due to rising prices, and the consumption of the rapidly growing West. It was officially reported in 1869 that "within five years more cotton spindles had been put in motion, more iron furnaces erected, more iron smelted, more bars rolled, more steel made, more coal and copper mined, more lumber sawn and hewn, more houses and shops constructed, more manufactories of different kinds started, and more petroleum collected, refined and exported, than during any equal period in the history of the country."

Manufactures.

315. Between the Civil War and 1872 the extension of the nation's activity to the industrial conquest of the great West, as well as the economic reorganization of the East, had a profound effect upon the development of the United States. Between 1862 and 1872 grants were made to the Union Pacific and Central Pacific companies, and to other connecting corporations, for railways from the Missouri to the Pacific, amounting to nearly 33,000,000 acres, and in the same period large loans of funds were made by the general government for this enterprise. Construction advanced rapidly after 1866, and by 1869 an all-rail connexion had been established on the line of the Union Pacific and Central Pacific railways between the East and San Francisco. Various grants were made in these years to other roads, both transcontinental and Middle Western. Between 1850 and 1871 Congress granted about 155,000,000 acres for railway construction, but not all these grants were perfected. It is estimated that some $500,000,000 were invested in the construction of Western railways between 1868 and the panic of 1873, and about 30,000 m. of railway had been added.

Pacific Railways.

316. The effects of this extraordinary extension of railway transportation were immediately apparent. In the Far West the railway lines rapidly made possible the extinction of the bison herds which had occupied the great plains. Divided into the northern and southern herds by the Union Pacific railway in 1869, the southern herds were slaughtered in the period between 1871 and 1879, and the northern herds between 1880 and 1883. This opened the way for the great extension of the cattle country, following the retreat of the Indians. Upon the plains Indians the effect was revolutionary. Their domain had been penetrated by the railways, at the same time that their means of subsistence had been withdrawn. During the Civil War most of these Western tribes had engaged in hostilities against the Federal government. In 1866 and 1867 General George Crook was reducing the Indians of the South-West to submission, while other generals trained in the Civil War were fighting the Indians in the northern plains and Kansas, Nebraska and Oklahoma. By the Peace Commission Act of the 20th of July 1867 commissioners, including General William T. Sherman, were sent to negotiate treaties. As a result the tribes of the Indian Territory were so concentrated as to permit the transfer of other Western tribes to the same region, while the Sioux of the northern plains were given a reservation embracing the western portions of the Dakotas. Discontent with these treaties resulted, however, in hostilities following 1867. Between the close of the war and 1880 some $22,000,000 were expended in Indian wars, although the act of 1871 inaugurated the change of policy whereby the Indians were no longer dealt with by treaty, but were regarded as wards of the nation, to be concentrated on reservations and fed at the expense of the nation under the supervision of Indian agents.

Effects of Railway Extension.

317. Part of these Indian difficulties were due to the opening up of new mining areas in the Rocky Mountains, some of them within the Indians' choicest hunting grounds. At the beginning of the Civil War a preliminary mining boom struck Colorado; the rich Comstock lode was opened in Nevada; Arizona was the scene of mining rushes; the Idaho mines were entered; and the Montana ores were discovered; so that in the period of the Civil War itself the Territories of Nevada, Idaho and Montana had been organized and the mountains provisionally occupied from the northern to the southern limit. The discovery of gold in the Black Hills in 1874 continued the same movement. In 1860 the nation produced $156,000 worth of silver, in 1861 over $2,000,000 and in 1873 nearly $36,000,000. In the last-mentioned year the production of gold amounted also to $36,000,000, although in 1860 it had been $46,000,000. Capital in mines and quarries of the United States was over $65,000,000 in 1860, over $245,000,000 in 1870, and nearly $1,500,000,000 in 1880.

Mining.

318. This revolution in the life of the great plains and the Rocky Mountains, opening the way to agriculture and to cattle raising, and preparing for the exploitation of the precious metals of that great area, was contemporaneous with the important development of the farming regions of the Middle West. Even during the Civil War the agricultural development of the northern half of the Mississippi Valley had continued. This was aided by the demand for food products to supply the armies and was made possible by the extension of railways, the taking up of the prairie lands through the operation of the Homestead Law of 1862, the marketing of the railway land grants, and the increased use of agricultural machinery in those years. Between 1860 and 1870 the population of the North Central group of states (engaged chiefly in grain raising) increased over 42%, and in the next decade by 34%, a total addition to the population in those two decades of 8,000,000. Between 1870 and 1880 about 200,000 sq. m. were added to the farm lands of the United States, an area almost equal in extent to that of France. In the same decade the North Central states increased their improved farms from near 78,500,000 acres to over 136,800,000 acres. The product of Indian corn about doubled between 1860 and 1880, and that of wheat and oats more than doubled. The addition came chiefly from the Middle West. In 1860 the North Central states raised 95,000,000 bushels of wheat; in 1870 nearly 195,000,000; in 1880 329,000,000. In 1870 the same states produced 439,000,000 bushels of corn; in 1880 they produced over 1,285,000,000.

Development of the Middle West.

319. The pressing need of increased transportation facilities had led, as we have seen, to lavish land grants and to subsidies by nation, states and municipalities to the railways. The railways themselves, tempted by these opportunities, had extended their lines in some cases beyond the immediate needs of the regions entered in advance of settlement. Extravagances in construction and operation, aggravated by "construction rings" of railway officials, who secured the contracts for themselves and their friends, and by rolling stock companies who received extravagant prices by favouritism, as well as the watering of stock in the creation of systems by absorption and consolidation of railway corporations, brought about a condition where the roads were no longer able to meet the demands of their stockholders for returns on the investment without imposing rates that the Western farmer deemed extortionate. In the competitive development of these roads and in the struggle of business corporations and localities with each other, the roads also discriminated between persons and places. This condition chiefly accounted for the political unrest which manifested itself in the West in the so-called "Granger" movements of the 'seventies.

Railway Abuses.

320. The farmers felt the pressure of the unsettled currency, taxes were very heavy, the protective tariff seemed to them to bear unduly upon the producers of crops which exceeded the home consumption and had to seek the foreign markets. The price of Indian corn, wheat and cotton in the early 'seventies tended to fall as production rose, so that the gold value of the total crop was not greatly increased during the decade after the war, in spite of the extraordinary extension of agricultural settlement and the increase of production. Dissatisfaction with his share in the prosperity of the country, and especially with the charges of middlemen and transportation companies, discontent with the backwardness of rural social conditions, and a desire for larger political influence, all aided in fostering the growth of

organizations designed to promote the farmers' interests. The most influential of these organizations was the Patrons of Husbandry, which was founded in 1867 and spread chiefly after 1872 by local clubs or "granges," especially in the West and South.

321. The height of the movement was reached in the autumn of 1874. It threatened the disruption of the old political parties in most of the Middle Western states. By holding the balance of power the Grangers secured legislation in many of these states, fixed maximum railway rates, and provided for regulation through commissions to prevent discriminations. In the reaction after the panic of 1873 (when nearly a fifth of the railway mileage of the United States had passed into the hands of receivers) many of the "Granger laws" were repealed, the regulation was rendered nominal and the railways more than regained their political power in the states; yet the agitation had established the important principle, sanctioned by decisions of the Supreme Court, that the railways were common carriers subject fully to public regulation so far as it was not confiscatory. The movement for regulation of interstate commerce by congressional legislation was begun at this time under the leadership of congressmen from the Granger states. Later efforts were more wisely considered and more effective; but the rural democracy showed its opposition to the increasing political influence of capital, to special privileges and to the attempts of corporations to avoid public control periodically thereafter (see FARMERS' MOVEMENT). The attempt to eliminate the middlemen by co-operative stores and grain elevators was another feature of the time which gained a brief strength but soon declined.

The "Granger" Movement.

322. The presidential election of 1872 took place in the midst of this Western upheaval. At the same time in the South the reform Republicans and Democrats were uniting under the name of "Conservatives" against the carpet-bag rule, and control was passing into their hands. A reform movement was active against the evident corruption in national and municipal administrations, for Grant's trust in his appointees was grossly violated. The Tweed Ring was systematically looting New York City, and prior to Tweed's indictment in 1871 (See NEW YORK (City); TAMMANY HALL; TILDEN, S. J.) it was acquiring large power in state legislation. Jay Gould, the railway operator, was one of the signers of Tweed's million dollar bail bond. Civil service reformers, men of moderate views with respect to Reconstruction, such as Carl Schurz, many War Democrats who had adhered to the Union party, and tariff reformers began to break away.

The Tweed Ring.

323. The Liberal-Republican movement started in Missouri, and a national convention was called to meet at Cincinnati on the 1st of May 1872. Their platform announced irreconcilable differences on the tariff and left it to the Congressional districts, attacked the corruption of civil service by the administration, supported the results of the war as embodied in the last three amendments and demanded amnesty and local civil government for the South. It opposed further land grants to railways, but denounced repudiation and demanded specie payments in terms which excluded from its support the advocates of inflation of the currency. This effort to combine the opponents of Grant's administration was wrecked by the nomination of Horace Greeley, a strong protectionist, who did not command the confidence of the masses of the disaffected. Although endorsed by the Democrats, Greeley was defeated by Grant, who ran on the record of the Republican party, which now dropped the word Union from its name. Greeley died before the electoral count; the Democrats won only the states of Maryland, Kentucky, Missouri, Tennessee, Georgia and Texas, the votes of Louisiana and Arkansas being thrown out.

Liberal Republican Movement.

Grant Re-elected.

324. The enormous cost of the war, the excessive railway building, over-trading, and inflated credit and fluctuating currency, the sinking of capital in opening new farming lands and in readjusting manufactures to new conditions brought their results in the panic of 1873, precipitated by the failure (Sept. 18) of Jay Cooke, the financier of the Northern Pacific railway. For over five years the nation underwent a drastic purgation; railway building almost ceased, and so late as 1877 over 18% of the railway mileage of the nation was in the hands of receivers. The iron industry was prostrated, and mercantile failures for four years amounted to $775,000,000. At the close of the period there was a replacement of partnerships and individual businesses by corporations, but in the interval political unrest was in the foreground.

Panic of 1873.

325. The charges that congressmen had been bribed by stock in the Crédit Mobilier (*q.v.*), a construction company controlled by Union Pacific stockholders, led to a congressional investigation which damaged the reputations of prominent Republicans, including Vice-president Schuyler Colfax; but the same Congress which investigated this scandal voted itself retroactive increases of salary, and this "back-pay grab" created popular indignation. Evidences of fraud and corruption in revenue collection under the "moiety system," and the general demoralization of the civil service continued. The demand for relief from the stringency of the crisis of 1873 expressed itself in the so-called Inflation Bill (passed April 1874), providing a maximum of four hundred million dollars for greenback issues. This was vetoed by Grant, but he later signed a bill accepting as a maximum the existing greenback circulation of $382,000,000. This compromise was satisfactory neither to contractionists nor greenbackers. The latter especially resented the provisions regarding the national banks and their circulation.

The Crédit Mobilier; the Salary Grab.

326. The "tidal wave" in the Congressional elections of 1874 was the result of these conditions. It marked a political revolution. The House of Representatives, which exhibited a two-thirds Republican majority in 1872, showed an opposition majority of about seventy, and the Senate was soon to be close. Such Republican strongholds as Pennsylvania, Ohio and Massachusetts went over to the Democrats in the state elections, while in the grain-raising states of the Middle West the Grangers were holding the balance of power, and in the South the Republican radicals remained in force in few states and only by the use of Federal troops. President Grant in his message of December 1874 acknowledged that public opinion was opposed to this use of force, but declared that without it negro suffrage would be worse than a mockery. Thus by the year 1874 the era of triumphant Republicanism and Reconstruction was closing. The leaders perceiving power about to pass from them rapidly enacted a series of party measures before the meeting of the newly elected Congress. Under the leadership of Senator John Sherman an act was passed (Jan. 14, 1875) providing for resumption of specie payments on the 1st of January 1879, gradually contracting greenbacks to three hundred million dollars and compensating this by expanding the circulation of the national banks. Sherman's personal preference was to make the greenbacks exchangeable for 4% bonds and thus to make the general public instead of the banking houses the purchasers of these securities, but he was unable to convince his colleagues. In the field of the tariff a similar policy was followed. The act of 1870 had somewhat reduced duties on tea, coffee, sugar and iron; but under Western pressure in 1872 the Republican Congress had consented to a 10% reduction on most classes of goods in order to save the general system of protection. On the eve of their relinquishment of full power the Republicans (March 3, 1875) repealed the Tariff Act of 1872, increased the duties on molasses and sugar and increased the revenue tax on tobacco and spirits. Thus the tariff was restored to the war basis, before the incoming Democratic House could block the advance. Similarly on the 1st of March Congress passed a Civil Rights Act, milder than the measure for which Sumner had fought so long, guaranteeing equal rights to the negroes in hotels, public conveyances, and places of amusement and forbidding the exclusion of them from juries. But an effort to pass a new force bill levelled against the intimidation of negro voters failed. By these measures the Republicans placed the

The Tariff.

Civil Rights Act.

important features of their policy where they could be overturned only by a Democratic capture of presidency and Senate.

327. In the midst of these changes the Supreme Court handed down decisions undoing important portions of the Reconstruction system by restraining the tendency of the nation to encroach on the sphere of the state; and restricting the scope of the recent constitutional amendments. On the 14th of April 1873, in the Slaughter House cases, the courts held that the amendments were primarily restrictions upon the states for the protection of the freedom of the coloured man, rather than extensions of the power of the Federal government under the definition of United States citizenship, and that general fundamental civil rights remained under state protection. In the case of the *United States* v. *Reese*, decided on the 27th of March 1876, the court declared parts of the act of 1870 (which provided for the use of Federal force to protect the negro in his right to vote) unconstitutional, on the ground that they did not specify that the denial of suffrage must be on the sole ground of race or colour. A reasonable prerequisite, such as a poll tax, for voting was permissible. The South later took advantage of this decision to restrain negro suffrage indirectly. In *United States* v. *Cruikshank* (1876) the court held that the amendments to the Constitution left it still the duty of the state, rather than of the United States, to protect its citizens, even when whites had mobbed the negroes. The right of the nation in the case was held to be limited to taking care that the state governments and laws offered equal protection to whites and blacks. The affirmation of the power of the states over common carriers in the *Granger cases* (1877) has been mentioned. In 1883 the court declared the conspiracy clause of the Ku-Klux Act unconstitutional and restricted the application of the law to acts of a state through its officers and not to private citizens. In the same year it declared the Civil Rights Act of 1875 invalid.

Supreme Court Decisions

328. In 1875 President Grant refused the appeal of the "carpet-bagger" Governor Adelbert Ames of Mississippi to be supported by troops, whereupon Ames resigned his office into the hands of the Conservatives. The Mississippi plan of general intimidation of negroes to keep them from the polls was followed in Louisiana, South Carolina and Florida which alone remained Republican. Thus steadily the radical Reconstruction policy and Republican control of the South were being reversed. It was made clear that negro suffrage could be enforced upon the South only by military rule which could no longer command Northern sympathy or the sanction of the Federal court. Northern interest increasingly turned to other issues, and especially to discontent over administrative corruption.

329. The spoils system had triumphed over the advocates of civil service reform to such an extent that Grant abandoned the competitive system in 1875 on the ground that Congress did not support him in the policy. Enormous frauds in the collection of the internal revenue by the Whisky Ring with the connivance of Federal officials were revealed in 1875, and about the same time, Secretary of War William W. Belknap resigned to avoid impeachment for corruption in the conduct of Indian affairs. The enforced resignation in 1876 of Secretary of the Treasury Benjamin H. Bristow (*q.v.*) after he had successfully exposed the Whisky Ring, and of Postmaster-General Marshall Jewell, who had resisted the spoils system in his department, tended to discredit the administration. Blaine, the leader of the Republicans in the House of Representatives, fell under suspicion on account of his earlier relations with the Little Rock & Fort Smith and Northern Pacific railways (see BLAINE, J. G.), which left it doubtful, in spite of his aggressive defence, whether he had not used his influence as speaker in previous Congresses to secure pecuniary advantages from land grant railways. This clouded Blaine's prospects for a presidential nomination, and the House of Representatives voted a resolution against the third term which Grant seemed not unwilling to accept.

The Whisky Ring.

330. Thus the campaign of 1876 approached, with the Republicans divided into (1) steadfast supporters of the Grant administration, (2) a discontented reform wing (which favoured ex-Secretary Bristow), and (3) an intermediate group which followed Blaine. This statesman made a bold stroke to shift the fighting which the Democrats planned to make against the scandals of the administration, to the old time war issues. By proposing to exclude Jefferson Davis from amnesty, he goaded southern congressmen into indiscreet utterances which fanned anew the fires of sectional animosity. The Republican platform, while deprecating sectionalism, placed the war record of the party in the foreground and denounced the Democracy, because it counted upon the united South as its chief hope of success. A compromise candidate was selected in the person of Governor Rutherford B. Hayes, of Ohio, who had vigorously opposed the greenback movement in his state, and whose life and character, though little known to the general public, made him acceptable to the reform leaders of the party. The Democrats, demanding reform, economy, a revenue tariff and the repeal of the resumption clause of the act of 1875, chose the reform governor of New York, Samuel J. Tilden, as their candidate. The Independent National, or Greenback, party, which was to develop rapidly in the next two years, nominated Peter Cooper, a New York philanthropist, and demanded the repeal of the Resumption Act, and the enactment of a law providing a paper currency issued directly by the government, and convertible on demand into United States obligations bearing a rate of interest not exceeding one cent a day for each one hundred dollars and exchangeable for United States notes at par. It also proposed the suppression of bank paper, and was in general antagonistic to the bond-holding and banking interests.

Party Platforms of 1876.

331. The election proved to be a very close contest. Tilden, according to the count of both parties, had a plurality of over a quarter of a million votes, and at first the leading Republican journals conceded his election. He had carried New York, Indiana, New Jersey and Connecticut and, by the Democratic count, the solid South. But the Republican headquarters claimed the election of Hayes by one electoral vote, based on the belief that the states of South Carolina, Florida and Louisiana,[1] had gone Republican. Since these states were in the midst of the transition from negro to white government, and elections were notorious for fraudulent practices, a serious question was raised, first as to the proper authority to count the electoral vote, and second, how far it was permissible to go behind the returns of the state authorities to ascertain the validity of the canvass of the votes in the state. The political capacity and moderation of the nation were severely tested; but in the end a characteristic American solution was found by the creation of an Electoral Commission (*q.v.*) in which five associate justices of the Supreme Court were joined with an equal number of representatives from each of the two houses of Congress. The result was that this commission refused to "go behind the returns," and Hayes was declared elected by one vote. To prevent the threatened danger of a filibuster by Democrats of the House of Representatives against the completion of the count until after legal date for the inauguration of the president, Hayes's friends agreed with leading Democrats that he would withdraw the Federal troops from Louisiana. Thus a new era began under a moderate and reforming Republican president, a close Republican Senate and a Democratic House of Representatives. The Southern question was not settled, but other issues of an economic and social nature increasingly forced themselves to the front. They were concealed in a measure by the fact that the following of each of the leading political parties was divided on financial policies, which resulted in attempts to compromise and evade the issue by the party managers. During the dozen years that followed Hayes's inauguration neither party held complete possession of both the executive and the two houses of Congress. His own moderate character, the conditions of his election and

Hayes Elected.

[1] There was a conflict with regard to the electoral vote of Oregon also. (See OREGON: *History*.)

the check imposed during the first two years by a Democratic House of Representatives (and during the second two years by an opposition in both houses) made the period of Hayes's administration a transition from the era of Reconstruction to the era of dominant economic and reform agitation.

332. When he withdrew the troops which sustained the Republican governments in Louisiana and South Carolina, those states returned to the rule of the white Democrats. In the Congress elected in 1878 the former slave states chose 101 Democrats to the House of Representatives and only four Republicans. Leading Republicans like Blaine protested vigorously against the policy, declaring that the men who saved the Union should govern it; and on the other hand the Democrats in Congress added "riders" to appropriation bills designed to starve the administration into complete cessation of the use of troops and Federal deputy marshals at Southern elections. Extra sessions had to be summoned in 1877 and 1879 to provide supplies for the government, due to this policy. Hayes assisted his party by vetoing these coercive attempts of the Democrats and it was not until later that Federal attempts to supervise Southern elections entirely ceased.

333. As his early policy toward the South had dissatisfied many of the leaders of his party, his opposition to the spoils system alienated others. In 1877 a Civil Service Reform Association was formed in New York, and under the leadership of reformers like George William Curtis, Carl Schurz, John Jay and Dorman B. Eaton, it extended to other states. In June 1877 President Hayes issued an executive order against the participation of Federal officers in political management, and he furnished evidence of his sincerity by removing Alonzo B. Cornell, the naval officer of New York, who was also chairman of both state and national Republican committees, and Chester A. Arthur, collector of the port of New York. As both men were friends of Senator Roscoe Conkling of that state, the leader of the Grant men, this was a bold challenge. The "Stalwarts" answered it by soon afterward securing the nomination of Cornell as governor of New York and Arthur as vice-president of the United States.

Civil Service Reform.

334. The monetary question rose to primary importance at this time. Hayes himself had campaigned in Ohio successfully against the Greenback movement, and he chose as his secretary of the treasury, John Sherman, former senator from that state, whose long service as chairman of the finance committee had made him familiar with conditions and influential with moderate men of all factions. The *per capita* circulation of the nation had fallen from $20·57 in 1865 to $15·58 in 1877 and was still declining. The remarkable increase in the production of silver, as the new mining regions were opened, was accompanied by a fall in its ratio to gold from 15 to 1 in 1860 to 17 to 1 in 1877. Congress had, in 1873, passed an act dropping the standard silver dollar from the list of coins; the significance of this omission of a coin not widely circulated, although it came at a time when European nations were adopting the gold standard, passed almost unnoticed at the moment; but the demonetization of silver was afterward stigmatized as a conspiracy, "the crime of 1873." As the date (January 1, 1879) for the redemption of the greenbacks in specie approached, demands were renewed for the replacement of national bank notes by greenbacks, for the postponement, or abandonment of resumption, for the free coinage of silver, and for the use of silver as well as gold in the payment of bonds redeemable in "coin." Sectional grouping of the debtor against the creditor regions, rather than party alignment, showed itself in the votes, for each party had its "soft money" as well as its "hard money" followers. Many who could not support the Greenback party in its theory that currency derived value from purchasing power based on the government's credit and authority rather than on convertibility, would, nevertheless, make larger use of paper money; while men who did not assent to the free coinage reasoning opposed the single gold standard as too narrow and too much under the influence of the speculative and banking interests, and would adopt some system of bi-metallism.

Coinage Act of 1873.

335. A Monetary Commission, appointed in 1876, reported in 1877, but without agreement or real influence upon the country. The president took strong ground against free coinage (though he would resume coinage of silver in limited quantities) and against the payment of bonds in silver; but the House of Representatives passed the measure, known as the Bland Bill, for the free coinage of silver, by a vote of 163 to 34. In the Senate this was amended, and as it finally passed both houses it was known as the Bland-Allison Act after the two leaders, the Democratic representative from Missouri and the Republican senator from Iowa. This compromise was carried over the veto of President Hayes and became a law on the 28th of February 1878. In the vote of the 15th of February, all but one of the senators from New England, New York and New Jersey opposed it, while the states west of the Alleghanies furnished only four opposing votes. The law restored the legal tender character of the silver dollar and authorized the secretary of the treasury to buy silver bullion at the market price, to an amount of not less than $2,000,000 nor more than $4,000,000 per month, and to coin the bullion into silver dollars. Silver certificates of denominations not less than ten dollars were to be issued upon deposit of silver dollars. As neither the silver nor the certificates circulated freely the denominations of the certificates were reduced in 1886, when they filled the deficiency in the contracting bank-note circulation.

The Bland-Allison Act.

336. Hardly had the Bland-Allison compromise been effected on the silver issue when an act was passed (May 31, 1878) forbidding the further retirement of greenbacks, which remained at $346,681,000. Substantially the same sectional alignment was followed in the vote on this bill as in the silver votes. Not satisfied with this legislation, nearly a million voters cast their ballots for Greenback party candidates at the Congressional elections in the autumn of 1878. The preparations of Secretary Sherman had been so carefully made, and the turning tide of trade brought coin so freely to the United States, that before the date of resumption of specie payments a gold reserve had been accumulated to the amount of $133,000,000 in excess of matured liabilities and the greenbacks rose to par before the date of redemption.

337. In the campaign of 1880, Hayes and Tilden both declined to stand for renomination. Thus the issue of the "fraud of 1876," which the Democratic platform called the paramount issue, was subordinated. Nor was it possible for the Republicans to force the tariff question into a commanding position, for although the Democratic platform declared for a tariff for revenue only, a considerable wing of that party led by Samuel J. Randall, of Pennsylvania, favoured protection. General Winfield S. Hancock, a distinguished soldier in the Civil War, whose nomination for the presidency by the Democrats was designed to allay Northern distrust, refused to make the tariff a national issue. The recent adjustment of the monetary question and the return of prosperity relegated the discussion of the currency also to a subordinate place, so that the Greenback party was able to poll only a little over 300,000 votes instead of the million which it commanded two years before. It favoured unlimited coinage of silver as well as the replacement of bank-notes by greenbacks.

Party Platforms of 1880.

338. The Republicans, after a heated convention in which the followers of Grant (who had recently returned from a several years' trip round the world), Blaine and Sherman, fought each other to a deadlock, selected General James A. Garfield (*q.v.*) of Ohio, who was political manager for Sherman in the convention. This was a blow to the Grant, or "Stalwart" wing, which was partly placated by the nomination of Arthur for the vice-presidency. Garfield's popular plurality was only a little over seven thousand out of a total vote of over nine millions; but his electoral vote was 214 to Hancock's 155. The area of the former slave

Garfield Elected President.

states marked the boundaries between the Republican and the Democratic states, except that Hancock also carried New Jersey, Nevada and California. The Republicans won the elections for the House of Representatives which would meet in 1881, and the Senate was at first nearly evenly divided, two independents holding the balance. In the ensuing four years party lines were badly broken, factions made bitter war upon each other, and the independent reformers or "Mugwumps" (*q.v.*) grew in numbers. The selection of Blaine as secretary of state committed Garfield to the anti-Grant wing, and the breach was widened by his appointment of the collector of the port of New York against the protests of Roscoe Conkling and Thomas C. Platt, the "Stalwart" senators from New York. They resigned, then sought re-election in order to vindicate the right of senatorial recommendation; but were defeated.

Assassination of Garfield; Arthur becomes President.

339. In the midst of this excitement the president was assassinated by a disappointed office-seeker of unsound mind. Vice-President Arthur, who succeeded Garfield in September 1881, by his tact and moderation won the admiration of former opponents; but the bad crops in 1881 and the dissatisfaction with boss rule among independent voters caused a Democratic victory in the Congressional campaign of 1882. Garfield's assassination had given new impetus to the movement against the spoils system, a National Civil Service Reform League had been organized in 1881, President Arthur presented the question in his message of December of that year, and in 1882 George H. Pendleton, a Democratic senator from Ohio, urged the subject upon the attention of Congress. Stimulated by the elections of 1882 Congress passed an act (January 16, 1883) authorizing the president to appoint a commission to classify certain of the Federal employees, and providing for appointment and promotion within this classified list by competitive examination, the employees being distributed among the states and territories according to population, with preference for soldiers and sailors of the Civil War. Congressional recommendations for these offices were not to be received, and political assessments for campaign purposes were forbidden. This was an effective beginning in the purification of the civil service; but the evil of assessment of employees was succeeded by the evil of soliciting campaign contributions from corporations interested in legislation. The extension of the competitive list proceeded gradually through succeeding administrations. The Edmunds Anti-Polygamy Act (1882) was levelled at the Mormons (*q.v.*), and the Chinese Exclusion Act was passed at the demand of labour, after a long agitation in 1882, the way having been prepared by the Treaty of Peking in 1880. Bills to this effect had been vetoed by Hayes and Arthur as violative of international agreement, but the desire of the politicians to win the California vote, and the compromise by which the exclusion was limited to ten years finally carried the measure, and the Supreme Court (1889) held it constitutional. Later acts modified and extended the exclusion.

Pendleton Act.

Anti-Polygamy Act; Chinese Exclusion.

340. From 1879 to 1890 the treasury showed a surplus of revenue over expenditure. This furnishes the explanation of much of the legislation of that period. It led to extravagant appropriations, such as the Arrears of Pensions Act of 1879, and the River and Harbor Act of 1882 providing for the expenditure of more than $18,000,000, which was passed over the veto of Arthur. Appropriation bills were merely constructed in various committees of Congress under a system of bargaining between interests and sections with primary reference to the political fortunes of the congressmen.

341. The surplus also strengthened the demand for a reduction of the tariff. A tariff commission, composed of men friendly to protection, appointed in 1882, proposed an average reduction of 20 to 25%. Nevertheless in the act as passed in 1883 duties were increased in general on those protected articles which continued to be imported in large volume, especially on certain woollen goods and about two-thirds of the imported cotton goods, and on iron ore and some steel products, while they were lowered on finer grades of wool and cheaper grades of woollen and cotton fabrics, &c. It was unsatisfactory to large portions of both parties and did not materially lower the revenue; but the act of 1883 made extensive reductions in internal taxes. As the Senate had just fallen into the hands of the Republicans, and the House would not become Democratic until the new Congress met, this protective law gave the former the advantage of position. Moreover the Democrats were themselves divided, nineteen Representatives (one-third from Pennsylvania) voting with the Republicans on the act of 1883. In the next Congress (1884), when the leaders made an attempt to rally the Democrats to show their position by passing a bill for a horizontal reduction of 20% in general, forty-one Democrats voted against the bill and prevented its passage through the House.

342. Thus the campaign of 1884 found both parties still lacking unity of policy although it seemed possible that the tariff might become the touchstone of the contest. The Republicans challenged the independents by nominating Blaine, whose record was objectionable to many reformers, and who had been chiefly identified with the Reconstruction politics. The Democrats, taking advantage of the situation, nominated Grover Cleveland (*q.v.*) of New York. He had won approval by his reform administration as mayor of Buffalo and as governor of New York during the past two years, when he had shown an independence of party "bosses" and had convinced the public of his sincerity and strength of character. He represented conceptions and interests which had grown up since the war, and which appealed to a new generation of voters. The platform emphasized the idea that "new issues are born of time and progress," and made the leading question that of reform and change in administration, lest the continued rule of one party should corrupt the government. On the question of tariff the Democrats took a conservative attitude, emphasizing their desire to promote healthy growth, rather than to injure any domestic industries, and recognizing that capital had been invested and manufactures developed in reliance upon the protective system. Subject to these limitations, they demanded correction of the abuses of the tariff and adjustment of it to the needs of the government economically administered. The Greenbackers nominated General Benjamin F. Butler of Massachusetts, recently chosen governor of that state on the Democratic ticket, but he polled only 175,000 votes, while John P. St John, the candidate of those who would prohibit the liquor traffic, secured 150,000 votes, an unprecedented gain. The Prohibitionist platform included a demand that all money, coin and paper, should be made, issued and regulated by the government and be a legal tender for all debts, public and private.

Party Platforms of 1884.

343. The campaign abounded in bitter personalities, and the popular vote was close, Cleveland's plurality being only twenty-three thousand. The great state of New York, with electoral votes enough to have turned the scale, was carried by the Democrats by only a few more than one thousand votes out of a total of over a million. Cleveland's electoral majority was 37. The election was nevertheless recognized as making an epoch. For the first time since victory came to Lincoln and the Republicans on the eve of the Civil War, nearly a quarter of a century earlier, the country had entrusted power to the Democrats, although over two-thirds of their electoral vote came from the former slave states. New York, Connecticut, New Jersey and Indiana constituted their Northern territory. Perhaps the most significant thing about the result was the evidence that in the North political and sectional habits and prejudices were giving way among a sufficient number of independent voters, responsive to strong personal leadership on reform issues, to turn the political scale. The transition from war issues which began in 1872, and became marked in 1876, was completed by the election of Cleveland in 1884.

Cleveland Elected President.

During the first half of his term President Cleveland had the opposition of a strongly Republican Senate. In the second half the Senate remained Republican by a majority of two, and the House continued Democratic. His civil service policy naturally met severe criticism not only from his party foes, but also from the spoilsmen among his Democratic followers, who desired a clean sweep of Republican office-holders, and from those of his independent supporters who looked to him to establish the service on a strictly non-partisan basis. The outcome of the first two years of his administration was that, of the entire body of Federal office-holders, two-thirds were changed and the obnoxious Tenure of Office Act was repealed, thus leaving the president the right of removal without presenting his reasons. Nevertheless there was a gain, for Cleveland somewhat checked the political activity of office-holders, the criticism by the Republicans placed them on record against the former spoils system, and before leaving the presidency (but after the election of 1888 showed that power was to pass to the Republicans), he transferred the railway mail service to the classified list requiring competitive examination.

Civil Service.

344. The transition of executive power for the time to the Democratic party, however much it impressed the imaginations of the public as the end of an era, was not so significant as the national growth and expansion in the decade between 1880 and 1890 whereby forces were set loose which determined the characteristics of the succeeding period. Between these years the nation grew from about fifty millions to over sixty-two millions. The Middle West, or North Central group of states, gained nearly five millions and the Western division over a million and a quarter. West of the Alleghanies altogether more than eight million souls had been added, while the old Eastern states gained but four millions. In 1890 the North Central division alone had achieved a population nearly five millions greater than that of the North Atlantic, while the trans-Alleghany region surpassed the whole East by about ten millions, and the numbers of its representatives in House and Senate placed the political destiny of the nation in its hands.

345. One of the most important reasons for the wholesale taking up of Western resources in these and the following years was the burst of railway building subsequent to the interruption of the panic of 1873. The eager pioneers pushed into western Kansas and Nebraska as they had into the northern Ohio Valley a half-century before. Nebraska grew from a population of one hundred and twenty-three thousand in 1870 to nearly half a million in 1880 and to over a million in 1890. From about a third of a million in 1870, Kansas rose to almost a million in 1880, and to nearly a million and a half in 1890. The railway had "boomed" the Golden West and a cycle of abundant rains seemed to justify the belief that the "Great American Desert" was a myth. Thus settlers borrowed money to secure farms beyond the region of safe annual rainfall under the agricultural methods of traditional pioneering. Swift disappointment overtook them after 1886, when droughts and grasshoppers ruined the crops and turned back the tide of Middle Western colonists until the western parts of these states were almost depopulated, Kansas alone losing one-seventh of its population; nor did prosperity return for a decade.

Development of the West.

346. As the column of settlement along the Ohio Valley had extended its flanks into the old North-West between the Ohio and the Great Lakes, and into the old South-West of the lower Mississippi after the War of 1812, so the later pioneers by railway trains began to take possession of the remoter and vaster North-West and South-West. The "granger roads," centring in Chicago, thrust their lines out to develop wheat farms in interior Iowa, Minnesota and the Dakotas, where the virgin soil of the prairie farms brought returns that transferred the wheat belt to this new land of promise, and by competition forced the older wheat areas to develop varied agriculture. The introduction of the recently invented steel roller system of making flour into the Minneapolis mills not only built up a great flour industry there but created a demand for the hard wheat suited to the North-western prairies. The pine forests of Michigan, Wisconsin and Minnesota were exploited in the same era.

347. A more impressive movement was in progress as additional transcontinental railways were extended from the frontier to the Pacific. In 1870 for a thousand miles west of Duluth, at the head of Lake Superior, along the line of the projected Northern Pacific railway, there were no cities or little towns. Relying upon its land grant and upon the undeveloped resources of the vast tributary region, the railway, after halting for a few years subsequent to the panic of 1873 at Bismarck on the Missouri rushed its construction to Seattle and was opened in 1883. The Great Northern, a product of the vision and sound judgment of James J. Hill, started from St Paul without a land grant and reached Puget Sound in 1893, constructing lateral feeders as it built. Thus a new industrial zone had been brought into existence. Colorado had become a state in 1876; in 1889 North Dakota, South Dakota, Washington and Montana were admitted as states and the next year Idaho and Wyoming were added. The Western political forces, especially the friends of silver, were thus given the balance of power in the Senate and additional weight in the electoral college.

348. As a new North-West was opened by the completion of the Canadian Pacific (1883), the Northern Pacific (1883) and the Great Northern (1893), so the new South-West was entered by the completion of the Southern Pacific from New Orleans across Texas, New Mexico, Arizona and southern California to San Francisco by 1883. In 1883 also the lines which became the Atchison, Topeka & Santa Fé, extending from the lower Missouri valley, with St Louis and Kansas City as important terminals, through south-eastern Colorado, northern Arizona and New Mexico, reached the same goal. The Denver & Rio Grande in the same period opened new mining areas between Denver and Ogden. Not only additional mines were reached by these lines, but a great cattle country, recently the habitat of the bison and the Indian, was opened. All the large cities commanding the approaches to this country developed packing industries, but Chicago especially profited. Although her main supply was still the Middle Western farms, this domestic supply was supplemented by vast quantities of range cattle. South-eastern Texas was the original home of these cattle ranches, but the driving of herds to supply the miners of the Rocky Mountains revealed the fact that the whole bison country was capable of supporting range cattle, and the practice grew of driving the stock to the feeding ground of the north and returning. The height of the movement along the cattle trail, which in its largest extent ran through the public lands of the great plains from Texas to the Dakotas and Montana, was reached in 1884. In that period cattlemen fought over the possession of the range, controlled vast tracts by seizing the approaches to the water supplies under perversion of the land laws, fenced in the public domain, either defiantly or by leases from land grant roads, and called out proclamations of presidents from Hayes to Cleveland. The steady advance of the farmer, and protective measures against the spread of the cattle diseases known as Texas fever, gradually prevented the continuance of the trail, and ultimately broke down the system of great ranches. The grade of cattle was improved and great packing interests organized the industry on the basis of concentrated large scale production. About 1870 shipment of livestock from Chicago had become significant, and within a decade the refrigerator car revolutionized the packing industry by making possible the shipment of dressed beef not only to the markets of the Eastern United States but even to Europe. The value of slaughtering and packing industries in the United States increased from less than thirty million dollars in 1870, to over three hundred millions in 1880, and to five hundred and sixty-four millions in 1890.

The South-West.

349. Another important revolution in American economic life was effected by the opening of new iron-mines, the growth of the steel and coal industry and the rise of an extraordinary internal commerce along the whole length of the Great Lakes. By 1890 the output of pig-iron in the United States surpassed

that of Great Britain, having doubled since 1880. The full meaning of the revolution is seen in the fact that by 1907 the United States produced more pig-iron and steel than Great Britain, Germany and France combined. As a result of the growth of the wheat, lumber and iron-ore production of the North-West, the traffic along the thousand miles of the Great Lakes grew (chiefly after 1890) by leaps, and changed from wooden sailing vessels to steel ships driven by steam. The traffic through the Sault Ste Marie Canal came greatly to exceed that through the Suez Canal.

Mining and Commerce.

350. The South shared in these industrial transformations. Not only did white labour produce an increasing proportion of the cotton crop, which was now extended into the cut-over pine lands, but cheap white labour came from the uplands to cotton mills situated at the water-powers. This, with the abundant supply of raw material, enabled the South to develop cotton manufacture between 1880 and 1890 on a scale that threatened New England's dominance. The southern Appalachians began to yield their treasures of coal and iron; northern Alabama became one of the great centres of the iron industry and the South produced nearly 400,000 tons of pig iron in 1880 and two and a half millions twenty years later. By 1890 the production of coal, iron-ore and pig-iron in this section was as great as that of the United States in 1870. The value of the products of manufacture in the South rose from $338,000,000 in 1880 to $1,184,000,000 in 1900. The exploitation of the long leaf pine forests also attracted Northern capital. Fruit and truck gardening grew rapidly, and the South began to exhibit traits of industrial development familiar in the North and West. Protective tariffs and the interests of capital found recruits in the old-time planting states; but the negro problem continued to hold the South as a whole to the Democratic party.

The South.

351. The opportunities opened to capital by these forces of growth in the West and South, as well as the general influence of an age of machine production, led to transformations in the East which brought new difficulties for political solution. The East began to exhibit characteristics of other long-settled countries where increasing density of population and highly developed industry are accompanied by labour troubles, and where problems of democratic society and government take the form of forcible action or political revolt, in the absence of ample outlets into adjacent areas of cheap lands and new opportunities. To capital the opening resources of the West, and the general national prosperity after 1879, offered such inducements that large scale production by corporations and vast designs became the order of the day. The forces which had exhibited themselves in increased manufacture and railway development between the Civil War and the panic of 1873 now found expression in a general concentration of industries into fewer plants with vastly greater capital and output, in the combination of partnerships into corporations, and of corporations into agreements, pools and trusts to avoid competition and to secure the needed capital and economies for dealing with the new problems of industrial magnitude. Western farming competition led to the actual abandonment of much inferior land in New England and to agricultural disadvantages in the Middle states. As agriculture became less attractive and as industrial demands grew, the urban population of the East increased at the expense of the rural. The numbers of cities of the United States with more than 8000 people nearly doubled between 1880 and 1890; by 1900 the urban population constituted a third of the total, and this phenomenon was especially marked in the North Atlantic division, where by 1900 over half the population was in cities of more than eight thousand inhabitants.

Industrial and Financial Changes.

352. In similar fashion concentration of industry in large establishments was in progress. In 1880 nearly two thousand mills were engaged in the woollen industry; in 1890 not many more than thirteen hundred. Even more marked was the change in iron and steel, where large-scale production and concentration of mills began to revolutionize this fundamental industry, and other lines of production showed the same tendency. The anthracite mines of Pennsylvania, the great resource for the nation, fell into the possession of seven coal-carrying railways which became closely allied in interest. In most of the important industries the tendency of large organizations to subject or drive out the small undertakings became significant. Already the railways to avoid "cut-throat competition" had begun to consolidate their systems by absorption of component lines, to form rate agreements and to "pool" their earnings in given districts. Western agitation had led to reports and bills by committees headed by Western congressmen, such as the report of William Windom, of Minnesota, in 1874, where the construction of Federal lines to regulate rates by competition, was suggested; the report of George W. McCrary of Iowa, whose bill for regulation was passed by the House in 1874 under the stimulus of the Granger movement, but failed in the Senate; that of John H. Reagan, of Texas (1878), whose bill forbidding pooling and compelling publicity of rates by the machinery of the Federal courts, was discussed for several years, but failed to become law; and that of Shelby M. Cullom, of Illinois, in 1886.

353. The decision of the Supreme Court in the *Wabash case*, made in that year, reversed the doctrine followed in the case of *Munn* v. *Illinois*, and held that the regulative power of the state (even in the absence of Federal legislation) was limited to traffic wholly within the state and not passing from one state to another. The Cullom bill as enacted into the Interstate Commerce Law of the 4th of February 1887, was framed to prevent unjust discriminations by the railroads between persons, places and commodities, the tendency of which was, as the report declared, to foster monopoly. The law forbade discriminations and pooling, made a higher charge for a short haul than for a long haul over the same road illegal (unless permitted after investigation by the commission), required publicity of rates, and provided for a commission to investigate and fine offenders. But the decisions of the commission were reviewable by the Federal courts and the offender could be coerced, if he refused to obey the commission, only by judicial proceedings. The commission was empowered to provide uniform accounting and to exact annual reports from the roads. The principle settled by the law was an important one, and marked the growing reliance of the former individualistic nation upon Federal regulation to check the progress of economic consolidation and monopoly. But the difficulties by no means disappeared; the Federal judiciary refusing to accept the findings of the commission on questions of fact, retried the cases; and the Supreme Court overruled the commission on fundamental questions, and narrowed the scope of the act by interpretation.

The Interstate Commerce Act.

354. Labour exhibited the tendency to combination shown by capital. The Knights of Labor, founded in 1869, on the basis of "the individual masses" instead of the trades unions, and professing the principle that "the injury of one is the concern of all," grew from a membership of about one hundred thousand in 1885 to seven hundred and thirty thousand in 1886. The number of strikes in 1886 was over twice as many as in any previous year. In one of the strikes on the Gould railway system six thousand miles of railway were held up. In New York, Henry George, author of books proposing the single tax on land as a remedy for social ills, ran for mayor of the city and received 68,000 out of 219,000 votes. At the same time socialistic doctrines spread, even among Western farmers. But sympathetic strikes, anarchistic outbreaks, and drastic plans for social change did not appeal to the people as a whole. The Knights of Labor began to split, and the unions, organized as the American Federation of Labor, began to take their place with a less radical membership. President Cleveland broke with precedents in 1886 by sending in the first message on labour, in which he advocated, without success, a labour commission to settle controversies. A national bureau of labour to collect statistics had been established in 1884; state legislation increasingly provided for arbitration of labour disputes, and regulation of factories and child

Labour Combinations; Industrial and Social Unrest.

labour. Early in 1885 a law had been enacted forbidding the importation of labour under contract, and in 1888 the Chinese Exclusion Act was continued. Immigration was exceptionally large in the decade from 1880 to 1890, amounting to about five and a quarter millions as compared with two million eight hundred thousand for the previous decade. But a large number of these new-comers settled on the newly opened lands of the Middle West. By 1890 the persons of German parentage in the Middle West numbered over four millions—more than half the total of persons of German parentage in the nation. Minnesota held 373,000 persons of Scandinavian parentage, and of the whole of this element the Middle West had all but about 300,000. The Irish constituted the largest element among the English-speaking immigrants. The population of foreign parentage amounted to one-third of the whole population of the United States in 1890. In the midst of this national development and turmoil President Cleveland struggled to unite his party on a definite issue. The silver question continued to divide each party, the continued fall of silver leading to renewed agitation for free coinage. In 1886 a bill for this purpose was defeated by a majority of 37 in the House, 98 Democrats favouring it, and 70 opposing, as against 26 Republicans for it and 93 against. The surplus led to extravagant appropriation bills, such as special pension bills, which Cleveland vetoed by the wholesale, thereby incurring criticism by veterans of the Civil War, and river and harbour improvement measures, particularly the act of 1886, to which the president gave reluctant assent and the bill of 1887 to which he gave a "pocket veto" by refusing his signature. But the retention of the surplus in the treasury would create a monetary stringency, its deposit in banks aroused opposition, and its use to buy bonds was unpopular with the Democrats. Cleveland boldly met the issue and gave purpose to his party by his annual message of December 1887, which he entirely devoted to an exposition of the situation arising from the surplus, and to a demand for a revision of the tariff in order to reduce revenue. He did not profess free trade doctrines: "It is a condition which confronts us, not a theory," he declared. The election of 1886 had reduced the Democratic majority in the House, but the president was able to induce his party to pass the Mills Bill (1888) through that body as a concrete presentation of policy. The bill put many important raw materials (including wool and unmanufactured lumber) on the free list, substituted *ad valorem* for specific duties to a large extent, and generally reduced the protective duties. It was believed that the measure would remit over fifty and a-half million dollars of duties, nearly twenty millions of which would result from additions to the free list. The Republican Senate also found party unity on the tariff issue and its committee on finance, under the leadership of Senator Nelson W. Aldrich of Rhode Island, drafted a counter proposal. They would reduce revenue by repealing the taxes on tobacco, and the taxes on spirits used in the arts and for mechanical purposes, and by revising the tariff so as to check imports of articles produced at home.

Immigration. *Cleveland's Vetoes.* *Tariff Message.* *The Mills Bill.*

355. On the tariff issue the two parties contested the election of 1888, the Republicans denouncing the Mills Bill and the Democrats supporting it. Blaine having withdrawn from the contest, and John Sherman having secured but little more than half the votes necessary to nominate, the Republicans picked from a multitude of candidates General Benjamin Harrison of Indiana, grandson of President William Henry Harrison, to run against Mr Cleveland. The popular vote was exceedingly close, but Harrison had an electoral majority of 65, having carried all of the states except the solid South, Connecticut and New Jersey. The increasing use of money to influence the election, and particularly the association of great business interests with such political "bosses" as Matthew S. Quay of Pennsylvania and Thomas C. Platt of New York, were features of the campaign. The Congressional elections ensured to the Republicans the undisputed control of all branches of the government when the Fifty-first Congress should convene, and it was generally agreed that the party had a mandate to sustain the protective tariff.

Benjamin Harrison elected President.

356. Lacking a large majority in either house the Republicans were not only exposed to the danger of free silver defections in the Senate, but to "filibustering" by the Democratic minority in the House as a means of blocking the victorious party's programme. These obstructive tactics were made possible chiefly by the use of privileged motions and roll calls to delay business, and the refusal to respond on the roll call for a vote, thus preventing a quorum. Speaker Thomas B. Reed of Maine, a virile and keen-witted leader, greatly strengthened the power of the speaker, as well as expediting the business of the House, by ruling that the Constitution required a present, not a voting, quorum; and in spite of disorderly protests he "counted a quorum" of those actually present. By securing rules sanctioning this action and empowering the speaker to refuse to entertain dilatory motions, that officer became the effective agent for carrying on the business of the party majority. As his power through the committee on rules, which he appointed, grew, he came, in the course of time, also to dominate the action of the House, refusing to recognize members except for motions which he approved, and through his lieutenants on important committees selecting such measures for consideration as seemed most desirable. This efficiency of action was secured at a loss to the house as a representative and debating body, responsive to minority proposals.

Speaker Thomas B. Reed.

357. But the discipline of party caucus and House rules enabled the Republican leaders to put through with rapidity a number of important laws. One of these was the measure known as the Sherman Anti-Trust Act of the 2nd of July 1890, which declared combinations affecting commerce between the several states, or with foreign nations, illegal and punishable by fine or imprisonment or both. This act, the full power of which was not exhibited until later, was a response to the growing unrest of the nation as other corporations emulated the success of the Standard Oil Trust (formed in 1882). The members of a trust combined in an organization managed by boards of trustees whose certificates the former owners accepted instead of their shares of stock in the component companies. Competition was thus eliminated within the combination and the greatly increased capital and economies enabled it not only to deal with the increasing magnitude of business operation, but also to master the smaller concerns which opposed it. State legislation had proved unable to check the process, partly because the trust was an interstate affair. By putting into operation its power under the Constitution to regulate interstate commerce, Congress responded to the popular demand for Federal restraint of these great combinations which threatened the old American ideals of individualism and freedom of competition. The trusts, although embarrassed, soon showed their ability to find other devices to maintain their unified control. Nor was the act used, in this period, to prevent the railways from agreements and combinations which in large measure neutralized the anti-pooling clause of the Interstate Commerce Act of 1887.

The Sherman Anti-Trust Act.

358. Another important law was the so-called Sherman Silver Purchase Act of the 14th of July 1890. By 1889 the ratio of silver to gold had fallen to 1 to 22. In the twelve years of the Bland-Allison Act of 1878 over 378,000,000 silver dollars had been coined from bullion purchased at the market price. This bullion value was falling: it was \$·89 in 1877 and \$·72 in 1889. The production of gold in the United States in 1878 was about two and one-half million fine ounces, and of silver about thirty-five millions; in 1890 the gold production was 1,588,000 and the silver 54,500,000. The Silver Purchase Act authorized the secretary of the treasury to purchase each month 4,500,000 oz. of silver at its market price and to pay for it in treasury notes redeemable at his discretion, in silver or gold. This law, passed to placate the demands of the free silver men by increasing the use of silver, was insufficient to prevent the Senate from passing a free coinage bill by a combination of Democrats and the

Sherman Silver Purchase Act.

silver Republicans, chiefly from the newer states of the Far West; but this free coinage bill was lost in the House by a small majority. The explanation of this sudden re-opening of the question was that of party apprehension. In some of the Republican states of the Middle West, long relied upon as safe, the Farmers' Alliance had been spreading, and fomenting a demand for unlimited coinage of silver. A silver convention held at St Louis in the fall of 1889 had been attended by many delegates from this region as well as from the new silver-mining states whose increased power in the Senate was soon to be effective. It was feared, therefore, that a veto of a free coinage measure might array the West and South-West against the East and break up the party.

359. The customs duties upon which the fighting of the campaign of 1888 had turned was promptly taken up, and in the McKinley Tariff Act of the 1st of October 1890 the Republicans embodied their conceptions of protection to American industry. Some of the main features of this law were: the addition of agricultural products to the protected articles; the extension of the free list, particularly the inclusion therein of raw sugar, which had been bringing in a revenue of $50,000,000 annually; the granting of compensating bounties to sugar planters to an amount of about $10,000,000 a year; and the raising of duties to the prohibitory point on many articles of general consumption which could be produced at home. Mr Blaine, then secretary of state, had just been active in promoting closer relations with South America wherein he hoped for an extension of American trade and he severely criticized the bill as it passed the House, because the free list opened wide the doors of American trade, particularly to sugar producing countries, without first exacting compensating advantages for our products in those markets. To meet this criticism a provision was finally added authorizing the president to impose discriminating duties where it was necessary to obtain the advantages of reciprocity.

The McKinley Tariff.

360. This tariff, which passed on the eve of the Congressional elections of 1890, was immediately followed by such increases in prices and the cost of living that it was potent in bringing about the political revolution, or "land slide," which swept the Republicans from power in the House of Representatives. The Republicans returned but 88 members as compared with nearly twice that number in the Congress which passed the McKinley Bill. The South sent but four Republicans; New England a majority of Democrats; and such strongholds of Republicanism as the Middle Western states of Illinois, Michigan, Wisconsin, Iowa and Kansas, hitherto responsive to the traditions of the Civil War, sent Democratic or independent delegations. Looked at broadly, the movement was a rural uprising, strongest in the South and Middle West, the old Granger areas, against forces which seemed to them to threaten their ideals of American democracy. But the movement was recruited by the silver-mining states and discontented labour interests.

361. Farm products had not proportionally shared the general increase in prosperity. This convinced large portions of the agricultural West that the currency system had too narrow a basis in gold, which was appreciating in value. Much of the Middle Western agricultural development had been made on borrowed Eastern capital, and it seemed to the farmer that the principal of his mortgage was in effect increasing with the rise in the price of gold, at the same time that his crops brought a smaller net profit. He did not give due attention to the effect of greatly increased production, as the new wheat lands were opened on such a grand scale; but he was keenly sensitive to increased freight rates and discriminations, to the influence of Eastern capitalists, banks, bondholders, trusts and railways upon Federal and state legislatures and judiciary, and to the large amount of railway lands, unproductively held by the companies, while the land hunger of the nation was exhibited in the rush to newly opened Indian lands, such as Oklahoma (1889) and parts of the Sioux reservation (1890). After the evidence of the power of this tide of Western discontent in the elections of 1890, those portions of it which were ripest for revolt combined in 1892 as the People's party or Populists, soon to prove an important political factor.

Western Discontent.

362. The Republicans meanwhile had been actively reducing the surplus. In 1892 the excess of revenue over expenditures was ten million dollars; by 1893 only two millions. This was effected not only by the Tariff Act but by such measures as the Dependent Pension Act of 1890 (resulting in a list of pensioners of the Civil War which cost the nation $68,000,000 by 1893, over half of these pensioners having been added during Harrison's administration); the rapid construction of the new navy, raising the United States from twelfth to fifth in the list of naval powers; the repayment of the direct war tax to the states (1891) to the amount of fifty-one millions; and other appropriations such as those provided by river and harbour bills. The Democrats stigmatized this Congress as a "billion dollar Congress" from its expenditures, to which Speaker Reed replied that the United States was a billion dollar nation. In fact the Democrats when they regained power were not able greatly to diminish the cost of government.

Pensions.

363. The Democratic House in the Fifty-second Congress repressed obstructive Republican tactics by methods like those adopted by Speaker Reed, and contented itself with passing a series of bills through that body proposing reductions of the tariff in special schedules, including free wool and a reduction of the duty on woollens, free raw material for the cotton planters of the South, free binding twine for the farmers of the North and a reduced duty on tin plate for the fruit raisers. The new industries of the southern Appalachians prevented action on coal and iron. Of course these bills failed in the Republican Senate. A bloody strike on the eve of the election of 1892 in the great steel works at Homestead, Pennsylvania, where armed guards engaged by the company fired upon the mob which sought higher wages, was not without its adverse effect upon public sentiment in regard to the Republican tariff for the protection of labour.

Homestead Strike.

364. During the campaign of 1892 the Democrats rejected a conservative tariff plank, denounced the McKinley tariff in violent language, and denied the constitutional power to impose tariff duties except for the purpose of revenue only. But Cleveland, who was renominated in spite of vigorous opposition from leading politicians of his own state, toned down the platform utterances on the tariff in his letter of acceptance. In their declarations upon the currency the Democrats furnished a common standing ground for the different factions by attacking the Silver Purchase Act of 1890 as a cowardly makeshift.

365. The People's party, in its national convention at Omaha (July 1892), drew a gloomy picture of government corrupted in all of its branches, business prostrated, farms covered with mortgages, labour oppressed, lands concentrating in the hands of capitalists. Demanding the restoration of government to the "plain people," they proposed an expansion of its powers, to afford an adequate volume of currency and to check the tendency to "breed tramps and millionaires." Among their positive proposals were: the free and unlimited coinage of silver at the legal ratio of sixteen to one; the expansion of a national currency issued directly to the people; the establishment of postal savings banks; government ownership of the railways, telegraph and telephone; restoration to the government of the lands held by railways and other corporations in excess of their needs; and a graduated income tax. In supplementary resolutions the Australian ballot system, which had spread rapidly in the past few years, was commended, as also were the initiative and referendum in law-making. Combining with the Democratic party in various states beyond the Mississippi, and with Republicans in some of the Southern states, they won large masses of voters in the West, and exerted an influence upon public opinion in that section beyond what was indicated in the returns, although General James B. Weaver of Iowa, their candidate for the presidency, received over 1,000,000 popular votes and 22 votes in the electoral college. The Republicans renominated President Harrison, though he lacked an enthusiastic personal following. They

The People's Party.

supported the McKinley Tariff Act in spite of the wave of opposition shown in the elections of 1890. But, fearing party divisions, they, like the Democrats, made an ambiguous declaration on the currency. The result of the election of 1892 was to return the Democrats under Cleveland to power by a plurality of over 380,000 and an electoral plurality of 132. Congress in both branches was to be Democratic in 1893, and the way was open for the first time in a generation for that party to carry out a policy unchecked by any legislative or executive branch of government.

Cleveland re-elected President.

366. But before Cleveland was fairly started in his second administration the disastrous panic of 1893 swept the nation, nor did prosperity return during the four years that followed. The panic is not, directly at least, to be traced to the silver purchases, but was the result of various causes, including the agricultural depression, farm mortgages, reckless railway financiering and unsound banking in the United States, as well as to Argentine and European financial troubles. The panic began in the spring with the failure of the Reading railway (which had undertaken the acquisition of coal land and an extension of activity beyond its resources) and the collapse of the National Cordage Company, one of the numerous examples of reckless trust financiering into which large banks had also been drawn. Clearing-house certificates were resorted to by the New York banks in June, followed in August by partial suspension of specie payments. Currency remained at a premium for a month; deposits in national banks shrank enormously; national bank loans contracted more than 14·7%; failures were common; 22,000 m. of railways were under receiverships, and construction almost ceased. The interruption to business is indicated by the decline of iron production by one-fourth.

Panic of 1893.

367. The panic of 1893 was in many ways a turning-point in American history. It focused attention upon monetary questions, prostrated the silver-mining states, embittered the already discontented farming regions of the West, produced an industrial chaos out of which the stronger economic interests emerged with increased power by the absorption of embarrassed companies, and was accompanied by renewed labour troubles. Most noteworthy of these was the Pullman Car Company strike near Chicago in 1894, which led to sympathetic strikes by the American Railway Union, extending over twenty-seven states and Territories from Cincinnati to San Francisco. Mobs of the worst classes of Chicago burned and looted cars. The refusal of Governor John P. Altgeld of Illinois to call out the militia, and the interference with the United States mails, led President Cleveland to order Federal troops to the scene, on the constitutional ground that they were necessary to prevent interference with interstate commerce and the postal service and to enforce the processes of the Federal courts. The latter issued a sweeping injunction requiring that the members of the American Railway Union or other persons desist from interference with the business of the railways concerned. The president of the striking organization, Eugene V. Debs, was imprisoned for contempt of court and conspiracy.

Railway Strike.

368. The most immediate political effect of the panic was upon the silver issue. Soon after the outbreak of the financial crisis, the gold reserve, which protected the greenbacks and the treasury notes issued under the Silver Purchase Act, shrank ominously, while foreigners returned their American securities instead of sending gold. To sell bonds in order to replenish the gold reserve, and to repeal the Silver Purchase Act without substituting free coinage, would aggravate western discontent and turn away the promise of recruits to the Democratic party from the Populists of the prairie and silver-mining states; to carry out the Democratic platform by a tariff for revenue only while mills were shutting down would be hazardous in the East. The fruits of victory were turning to ashes; but Cleveland summoned a special session of Congress for August, while the panic was acute, and asked his party to repeal the Silver Purchase Act without accompanying the repeal with provisions for silver. Not until the last of October 1893 was repeal carried, by a vote in which the friends of repeal in the House were about equally divided between Democrats and Republicans, and nearly two-thirds of its opponents Democrats.

Repeal of Silver Purchase Act.

369. By this time the surplus had disappeared and the gold reserve was drawn upon for ordinary expenses. Early in 1894 the administration, failing to secure legislation from Congress to authorize the sale of gold bonds on favourable terms to protect the reserve, sold under the Resumption Act of 1875 $50,000,000 5% bonds, redeemable in ten years. Part of this very gold, however, was withdrawn from the reserve by the presentation of legal tender notes for redemption, and the "endless chain" continued this operation to the verge of extinguishing the reserve, so that another loan of $50,000,000 in 1894 was followed in 1895 by a dramatic meeting between Cleveland and some of his cabinet with the important Wall Street banker, J. Pierpont Morgan, who agreed on behalf of his syndicate to sell the government $65,166,000 of gold for $62,315,000 of bonds, equivalent to 4% bonds for thirty years at a price of 104. In return the syndicate agreed to use its influence to protect the withdrawals of gold from the treasury. These securities were over-subscribed when offered to the public at 112¼. President Cleveland had protected the treasury and sustained the parity of gold and silver, but at the cost of disrupting his party, which steadfastly refused to authorize gold bonds. Again, in the beginning of 1896, the treasury was forced to sell bonds, but this time it dealt directly with the public and easily placed $100,000,000 in bonds at about 111, affording a rate of interest about equal to 3·4%.

370. Before the political harvest of the monetary issue was reaped, the Democrats had also found party ties too weak to bear the strain of an effective redemption of the party pledges on the tariff. The Wilson Bill prepared as the administrative measure was reported late in 1893, while the panic was still exerting a baneful influence. Its leading features were the substitution of *ad valorem* for specific duties in general, the extension of the free list to include such materials of manufacture as iron ore, wool, coal, sugar and lumber, and the reduction of many prohibitory rates. The loss in revenue was partly provided for by an income tax, significant of the new forces affecting American society, and an increase in the duty on distilled liquors. Although the bill passed the House by an overwhelming majority, it met the opposition in the Senate of the representatives, Democratic as well as Republican, of those states whose interests were adversely affected, especially the iron ore and coal producing states of the Southern Appalachians, the sugar producers of Louisiana, the wool growers and manufacturers of Ohio, and the regions of accumulated property in the East, where an income tax was especially obnoxious. Led by Senators Arthur P. Gorman, of Maryland; Calvin S. Brice, of Ohio; and David B. Hill, of New York, the bill was transformed by an alliance between Democratic and Republican senators, on the plea that it would otherwise result in a deficit of $100,000,000. Coal, iron ore and sugar were withdrawn from the free raw materials and specific duties replaced *ad valorem* in many cases, while many other individual schedules were amended in the direction of protection. The House, given the alternative of allowing the McKinley Act to remain or to accept the Senate's bill, yielded, and the Wilson-Gorman Tariff Act became a law without the president's signature, on the 27th of August 1894. He called upon his followers still to fight for free raw materials, and wrote bitterly of "the trusts and combinations, the communism of pelf, whose machinations have prevented us from reaching the success we deserved." Even the income tax was soon (1895) held by the Supreme Court to be unconstitutional.

The Wilson Bill.

371. Toward the close of his administration Cleveland's brusque message on the Venezuelan boundary question (see later) aroused such excitement and so rallied the general public (though not the more conservative) that the war spirit, shown soon afterwards against Spain, might have been a potent factor

in the election of 1896 had not England exhibited exceptional moderation and self-restraint in her attitude. The silver question, therefore, became the important issue. The Republicans nominated McKinley and declared for the gold standard in opposition to free coinage, losing thereby an influential following in the silver-mining and prairie states, but gaining the support of multitudes of business men among the Democrats in the East and Middle West, who saw in the free-silver programme a violation of good faith and a menace to returning prosperity. The Democratic convention marked a revolution in the party. The old school leaders were deposed by decisive majorities, and a radical platform was constructed which made "the free and unlimited coinage of both silver and gold at the present legal ratio of sixteen to one, without waiting for the aid or consent of any other nation," the paramount issue. Objecting also to the decision against the income tax, and to "government by injunction as a new and highly dangerous form of oppression," they incurred the charge of hostility to the Federal judiciary. William J. Bryan made a brilliant speech in behalf of free coinage, and so voiced the passion and thought of the captivated convention that he was nominated by it for the presidency over the veteran free-silver leader, Richard P. Bland of Missouri. The Cleveland men, or "gold Democrats," broke with their party after it became committed to free silver, and holding a convention of their own, nominated General John McA. Palmer of Illinois for the presidency on a platform which extolled Cleveland, attacked free coinage, and favoured the gold standard. Its main influence was to permit many Cleveland men to vote against Bryan without renouncing the name of Democrats. On the other hand the Populist convention also nominated Bryan on a platform more radical than that of the Democrats, since it included government ownership of the railways, the initiative and referendum, and a currency issued without the intervention of banks.

Free Silver Issue; William J. Bryan.

Gold Democrats.

372. The contest was marked by great excitement as Bryan travelled across the country addressing great audiences. The endangered business interests found an efficient manager in Marcus A. Hanna of Ohio, McKinley's adviser, and expended large sums in a campaign of education. In the event, the older states of the Middle West, holding the balance between the manufacturing and capitalistic East and the populistic prairie and mining states of the West, gave their decision against free silver. But class appeals and class voting were a marked feature of the campaign, the regions of agricultural depression and farm mortgages favouring Bryan, and those of urban life favouring McKinley. Labour was not convinced that its interests lay in expanding the currency, and Mr Hanna had conducted McKinley's campaign successfully on the plea that he was the advance agent of prosperity under the gold standard and a restoration of confidence. McKinley carried all the Northern states east of the Missouri, and North Dakota, Oregon and California of the Farther West, as well as Maryland, Delaware, West Virginia and Kentucky along the borders of the South. His plurality over Bryan in the popular vote was more than 600,000, and his electoral majority 95. All the departments of government were transferred by the election to the Republicans.

William McKinley elected President.

373. Having secured power, the administration called a special session of Congress, and enacted the Dingley protective tariff (July 24, 1897), under which the deficit in the treasury was turned into a surplus. The act raised duties to their highest point, and as the protective schedules included some important articles produced by trusts which had a practical monopoly, such as sugar and petroleum, this was seized upon by the Democrats to stigmatize the tariff as the "mother of trusts." Many articles which had been placed on the free list in the Tariff Act of 1894, including lumber, wool and the raw material for cotton baling, were made dutiable. The high rates were defended, in part, by the provision authorizing the president to negotiate reciprocity treaties under which they might be lowered. Several such treaties were signed, but the Senate refused to ratify them.

Dingley Tariff.

374. The Republicans also wrote their triumph into the Gold Standard Act of the 4th of March 1900, which ensured the maintenance of this standard by reserving $150,000,000 of gold coin and bullion to redeem the United States notes and the treasury notes of 1890, and by authorizing the sale of bonds when necessary to maintain the reserve. National banks were authorized in the smaller towns (three thousand or less) with a capital of $25,000, half of that formerly required, and increased circulation was further provided for by permitting the national banks to issue United States bonds up to their par value.

Gold Standard Act.

375. The economic policy of the Republicans was facilitated by the prosperity which set in about 1898. The downfall of silver-mining turned the prospectors to seek new gold fields, and they found them, especially in Alaska, about this time; and contemporaneously the chemists discovered cheaper and more efficient methods of extracting the gold from low-grade ores. Within five years after the crisis of 1893 the gold production of the United States nearly doubled. The United States coined $437,500,000 in gold in the five-year period 1897-1902, while the average for five-year periods since 1873 had been only $224,000,000. Thus gold instead of silver began to inundate the market, and to diminish the demand for expansion of the currency. Agriculture, prostrated in the years immediately preceding and following the panic of 1893, turned to the scientific study of its problems, developed dry farming, rotation and variety of crops, introduced forage crops like alfalfa, fed its Indian corn to cattle and hogs, and thus converted it into a profitable and condensed form for shipment. Range cattle were brought to the corn belt and fattened, while packing industries moved closer to these western centres of supply. Dairy-farming replaced the unprofitable attempts of older sections of the Middle West and the East to compete with the wheat-fields of the Farther West. Truck and fruit farming increased in the South, and the canning industry added utility to the fruits and vegetables of the West. Following the trend of combination the farmers formed growers' associations and studied the demand of the market to guide their sales. The mortgaged farms were gradually freed from debt. The wheat crop increased from less than 400,000,000 bushels valued at $213,000,000 in 1893 to 675,000,000 bushels valued at $392,000,000 in 1898. Prosperity and contentment replaced agitation in the populistic West for the time, and the Republican party gained the advantage of these changed conditions. Land values and the price of farm products rose. The farmers soon found it profitable to sell all or part of their land and re-invest in the cheaper virgin soils of the farther North-West and South-West, and thus began a new movement of colonization into the new West, while the landowners who remained gained an increasingly higher status, though farm labour failed to share proportionally in this advance.

Economic and Industrial Changes.

376. In the South also there was greater contentment as the new industries of iron, textiles and forestry grew, and as the cotton crops increased. Unrest was diminished by the new state constitutions, which after 1890 disqualified negro voters by educational and tax requirements so contrived as not to disfranchise the poor whites.

The South.

377. In the decade which followed the crisis of 1893 a new industrial structure was made out of the chaos of the panic. "High financiering" was undertaken on a scale hitherto unknown. Combinations absorbed their weaker rivals; Standard Oil especially gained large interests in New York banks and in the iron mines and transportation lines about the Great Lakes, while it extended its power over new fields of oil in the South-West. In general, a small group of powerful financial interests acquired holdings in other lines of business, and by absorptions and "community of interest" exerted great influence upon the whole business world. The group of financiers, headed by J. Pierpont

"High Financiering."

Morgan, came to dominate various Southern transportation lines and the anthracite coal roads and mines, and extended their influence to the Northern Pacific railway; while a new genius in railway financiering, Edward H. Harriman, began an avowed plan of controlling the entire railway system of the nation. Backed by an important banking syndicate he rescued the Union Pacific from bankruptcy, and with its profits as a working basis he started in to acquire connecting and competing lines. Labour also shared in the general prosperity after 1898. Relative real wages increased, even allowing for the higher cost of living, and the length of the working day in general decreased except in special industries.

General Prosperity.

378. By 1900 the continental United States had a population of 76,000,000; an aggregate real and personal wealth of $88,500,000,000; a per capita public debt of $14·52, and per capita money circulation of $26·94 against $21·41 in 1896. In 1901 bank clearings amounted to nearly $115,000,000,000 against $45,000,000,000 in 1894. Imports of merchandise had fallen in this period, while exports rose from about $847,000,000 in 1893 to $1,394,000,000 in 1900. Of these exports food stuffs and food animals, crude and partly manufactured, aggregated nearly 40% of the total. The production of pig-iron, which was about 7,000,000 long tons in 1893, was nearly twice that in 1900. This economic prosperity and these far-reaching processes of social change by which the remaining natural resources of the nation were rapidly appropriated, went on contemporaneously with the extension of the activity of the nation overseas. The first rough conquest of the wilderness accomplished, the long period of internal colonization drawing to a close, the United States turned to consider its position as a world power.

Isthmian Canal.

379. To understand this position it is necessary to return to an earlier period and briefly survey the foreign relations since the close of the Reconstruction era. The most significant and persistent influence came from the growing interest of the United States in the Pacific, as its population and economic power extended to that ocean. The problem of an overflow of Chinese migration to the Pacific coast, and the jeopardizing of the American standard of labour by this flood, had been settled by various treaties and laws since 1880. The question of the relation of the United States to an interoceanic canal was not so easily settled. In 1878 Colombia granted a concession to a French company, promoted by Ferdinand de Lesseps, the engineer of the Suez Canal, to dig a tide-level canal through the Isthmus of Panama. President Hayes voiced the antagonism of the United States to this project of European capital in his message of 1880 in which he declared that such a canal should be under the control of this nation, and that it would be "virtually a part of the coast-line of the United States." Although an American company was organized to construct a canal under a concession from Nicaragua in 1884, no real progress was made, and the French company, defeated by engineering and sanitary difficulties, failed at the close of 1888.

Pan-American Congress.

380. Meantime, for a few months, Blaine, as secretary of state under President Garfield, began a vigorous foreign policy with especial reference to the Pacific. He attempted to get the consent of England to abrogate the Clayton-Bulwer Treaty of 1850, which contemplated the construction of an isthmian canal by private enterprise under joint control and neutralization of the United States and Great Britain, together with such other powers as should join them. In South America he actively pressed the influence of the United States to settle the war between Chile and Peru. Again, in the years from 1889 to 1892, Blaine held the portfolio of state, and attempted to increase the influence of his country in Spanish America by the Pan-American Congress of 1890, which proposed a great international railway system and bank, commercial reciprocity and arbitration, without immediate results. (See Pan-American Conferences.) Indeed, the bad feeling aroused by his earlier policy toward Chile found expression in 1891 in a mob at Valparaiso, when some of the men from the United States ship "Baltimore" on shore leave were killed and wounded. An apology averted the war which President Harrison threatened.

Chile.

Bering Sea.

Blaine also asserted, against Canada particularly, the right of the United States to the seals of the Bering Sea; but in 1893 arbitrators decided against the claim.

Samoan Islands.

Hawaiian Islands.

381. As the navy grew and American policy increasingly turned to the Pacific, the need of coaling stations and positions advantageous to its sea power was appreciated. By a tripartite treaty in 1889 the Samoan islands were placed under the joint control of the United States, England and Germany, and, a decade later, they were divided among these powers, Tutuila and the harbour of Pago-Pago falling to the United States. The Hawaiian islands, which had been brought under the influence of civilization by American missionaries, were connected by commercial ties with the United States. Upon the attempt of the ruler to overturn the constitution, the American party, aided by the moral support of the United States, which landed marines, revolted, set up a republic, and asked annexation to the Union. A treaty, negotiated under President Harrison to this end, was withdrawn by President Cleveland, after investigation, on the ground that the part of the United States in the revolution was improper. He attempted without success to restore the original state of affairs, and on the 7th of July 1898 the islands were annexed.

Venezuelan Boundary.

382. President Cleveland's conservatism in this and other matters of foreign policy had not prepared the people for the sudden exhibition of firmness in foreign policy with which he startled the nation in his message of December 1895 upon the question of the boundary of Venezuela. That nation and England had a long-standing dispute over the line which separated British Guiana from Venezuela. Great Britain declined to arbitrate, at the suggestion of the United States, and gave an interpretation to the Monroe Doctrine which the administration declined to accept. President Cleveland thereupon brusquely announced to Congress his belief that Great Britain's attitude was in effect an attempt to control Venezuela, and proposed that a commission on the part of the United States should report upon the disputed boundary, and support Venezuela in the possession of what should be ascertained to be her rightful territory. Secretary-of-State Richard Olney declared: "To-day the United States is practically sovereign on this continent, and its fiat is law upon the subjects to which it confines its interposition." Great Britain tactfully accepted arbitration, however, and in the end (1899) was awarded most of the territory regarding which she had been unwilling to arbitrate.

Cuba; Spanish-American War.

The growing activity of the United States in foreign relations next manifested itself against Spain. Cuba in its commanding position with reference to the Gulf of Mexico and the approaches to the proposed isthmian canal, as well as in its commercial relations, and its menace as a breeding spot for yellow fever, had long been regarded by the United States as an important factor in her foreign policy. Successive administrations from the time of Jefferson had declared that it must not fall to another European nation, if Spain relinquished it, and that it was against the policy of the United States to join other nations in guaranteeing it to Spain. Between 1868 and 1878 a harsh war had been in progress between the island and the mother country, and American intervention was imminent. But Spain promised reforms and peace followed; again in 1895 revolt broke out, accompanied by severe repressive measures, involving grave commercial injury to the United States. (See Spanish-American War.)

Treaty of Paris, 1898.

383. By the Treaty of Paris, signed on the 10th of December 1898, Spain lost the remaining fragments of her ancient American Empire. She relinquished Cuba, which the United States continued temporarily to occupy without holding the sovereignty pending the orderly establishment of an independent government for the island. Porto

Rico, Guam and the Philippines were ceded outright to the United States, which agreed to pay $20,000,000 to Spain, and to satisfy the claims of its citizens against that power. By the treaty Congress was to determine the civil rights and political status of the native inhabitants of the ceded territory.

Results of the War.

384. As a result of the Spanish-American War, the United States found itself in a position of increased importance and prestige among the nations of the world. Especially in the Pacific, it was immediately involved in the diplomatic situation created by the efforts of European states to divide China into spheres of influence or of actual possession. The interests of the United States in the trade with China, as well as her new position in the Philippines, inclined her to oppose this policy, and Secretary-of-State John Hay showed himself one of the great American diplomats in his treatment of this difficult problem. In order to preserve Chinese entity and the "open door" for trade, he drew replies from the nations concerned, the result of which was to compel them to avow and moderate their intentions. When the Boxer insurrection broke out in China in 1900, and the legations were besieged at Peking, it was largely through the United States that a less rigorous treatment was secured for that disordered nation.

385. The acquisition of Porto Rico and the acceptance of responsibilities in Cuba gave new importance to the isthmian canal and increased the relative weight of the United States in regard to its control. The popular excitement with which the voyage of the "Oregon" was followed, as it took its way 14,000 m. around South America to participate in the destruction of the Spanish fleet in the battle of Santiago, brought home to the American people the need of such communication between the Atlantic and Pacific coasts.

The Philippines.

386. But the immediate political issues were concerned with problems of the relation of the newly won lands to the United States government. Bryan had persuaded his party to join in ratifying the treaty of Paris, expecting to determine the status of the islands later. But attention soon turned to the insurrection which broke out (Feb. 4, 1899) in the Philippines (*q.v.*) under Aguinaldo, after it became probable that the administration intended to retain these islands, not under a weak protectorate, but as a possession to be ruled and "assimilated." It was not until the spring of 1902 that this insurrection was completely put down, and in the interval the question of the destiny of the islands and the harshness of the measures of repression aroused political debate. The Democrats and many Republicans charged the administration with a policy of imperialism.

Porto Rico and Cuba.

387. The same issue was involved, in its constitutional and economic aspects, in the treatment of Porto Rico and Cuba. While the insurrection continued in the Philippines the government there was legally a military one, although exercised in part through civil officers and commissions. But in the case of Porto Rico the question was whether the "Constitution follows the flag," that is, whether it extended of its own force without an act of Congress to acquired territory, and covered the inhabitants with all the rights of citizens of the United States, as an integral part of the American people. Not only was it a question whether the native inhabitants of these new acquisitions could be wisely entrusted with this degree of political liberty, but the problem of the tariff was involved. The beet sugar producers of the United States feared the effect of the competition of Porto Rican sugar unless a protective tariff excluded this commodity. But if Porto Rico were an integral part of the United States the Dingley tariff could not be applied against its products, since this act imposed duties only on articles from "foreign countries." To meet this difficulty the Foraker Act of 1900 imposed a special tariff for two years upon Porto Rico, the proceeds to go to that island's own treasury. The act further asserted the principle that the inhabitants of the new possessions were not incorporated into the United States or entitled to all the privileges of citizens of the United States under the Constitution, by declaring that statutory acts of the United States locally inapplicable should not be in force in Porto Rico. The Supreme Court sustained this act in 1901, holding that Porto Rico was not so strictly a part of the United States that separate customs tariffs could not be imposed upon the territory. The close division of the court and the variety of opinions by which the decision was sustained left it somewhat uncertain whether and how far the Constitution extended of its own force to these annexations. The Foraker Act also provided a government for the island (see PORTO RICO). In Cuba the United States remained in authority until the 20th of May 1902, and details of the work of the government there, and the subsequent arrangements whereby the United States secured the substantial advantages of a protectorate without destroying the independence of Cuba, will be found in the article on CUBA.

"Imperialism."

388. Meantime, in the election of 1900, the Democrats renominated Bryan on a platform which opposed the Republican administration's acts in relation to the newly acquired territory and declared that "imperialism" was the paramount issue. The platform reaffirmed its silver doctrine of the previous campaign and denounced the tariff as a breeder of trusts. The Republicans renominated McKinley and endorsed his administration. While the Democrats declared for publicity in the affairs of interstate corporations and favoured enlargement of the interstate commerce law to prevent discriminations in railway rates, the Republicans were less hostile in their attitude toward the combinations, admitting the necessity of honest co-operation of capital to meet new business conditions. The Populists divided, the "anti-fusionists" supporting a separate ticket, with free silver, government ownership of railways, and anti-imperialism prominent in their demands; the other wing supported Bryan.

Re-election and Assassination of McKinley.

Marcus A. Hanna, the Republican campaign manager, who was increasingly influential with the great business interests of the country, appealed to labour to support the administration and thereby retain "a full dinner pail." McKinley received an electoral majority of 137 and a popular plurality of 849,790. Before his second term was fairly begun he was shot by an anarchist while attending the Pan-American Exposition at Buffalo, and died on the 14th of September 1901. His wisdom in choosing able cabinet officers, his sympathetic tact in dealing with men and with sections, as well as the victories of the Spanish-American War, had brought him popularity even among his political opponents. But McKinley, like Cleveland, lacked the imagination to perceive and the desire to voice the aspirations and demands that had been gathering force for many years for legislation and executive action that should deal with the problem of effective regulation of the economic forces that were transforming American society. This gave his opportunity to Theodore Roosevelt (*q.v.*), who as vice-president now succeeded to office.

Roosevelt.

It was in foreign relations, which Secretary Hay continued to conduct, that continuity with McKinley's administration was most evident. But even here a bolder spirit, a readiness to break new paths and to take short cuts was shown by the new president. Venezuela had long delayed the payment of claims of citizens of various nations. In 1901, the president, having been informed by Germany of its intention to collect the claims of its citizens by force, but without acquisition of territory, announced that the United States would not guarantee any state against punishment if it misconducted itself, provided that the punishment did not take the form of acquisition of territory. As a result, a blockade of Venezuela was undertaken by the joint action of Germany, England and Italy at the close of 1902. The diplomatic intervention of the United States early the next year resulted in Venezuela's agreement to pay the claims in part and to set aside a portion of her customs receipts to this end. But since the blockading powers demanded preferential treatment, the United States secured a reference of the question to the Hague court, which decided that this demand was justified. San

Domingo offered a similar problem, having a debt incurred by revolutionary governments, beyond its power to pay, and being threatened with forcible intervention by European states. President Roosevelt, in 1904, declared that in case of wrongdoing or impotency requiring intervention in the western hemisphere the United States might be forced "to the exercise of an international police power." In 1905 San Domingo and the United States signed a protocol under which the latter was empowered to take possession of the custom-house, conduct the finances and settle the domestic and foreign debts of San Domingo. In spite of the refusal of the Senate to assent to this protocol, President Roosevelt put the arrangement unofficially into effect, until, in 1907, the Senate consented to a treaty authorizing it with some modifications.

San Domingo.

389. In the Far East the Boxer insurrection in China had been followed by the combined military expedition of the powers to the relief of Peking (in which the United States shared), and the exaction of a huge indemnity, of which the United States relinquished nearly half of its share, as in excess of the actual losses. The United States protested against Russian demands upon China, and actively participated in the negotiations which resulted in Russia's agreement to evacuate Manchuria. The delays of that power and her policy toward China having led Japan to declare war, Secretary Hay's diplomacy was influential in limiting the zone of hostilities; and the good offices of President Roosevelt brought about the conference between the two powers at Portsmouth, New Hampshire, which terminated hostilities in 1905. In this, and in his efforts to promote peace by extending the power of the various international peace congresses and by making the Hague tribunal an effective instrument for settling disputes, Roosevelt won the approval of Europe as well as of America. The dispute over the boundary between Alaska and Canada was narrowed by diplomatic discussion, and the remaining questions, involving the control of important ports at the head of the great inlets which offered access to the goldfields, were settled by arbitration in 1903 favourably to the American contentions.

Policy in the Far East; the Portsmouth Treaty.

390. The Isthmian Canal also received a settlement in this administration by a process which was thoroughly characteristic of the resolution of President Roosevelt. The Clayton-Bulwer treaty was superseded by the Hay-Pauncefote treaty of 1901, by which Great Britain withdrew her objections to a canal constructed by the United States, and under the sole guarantee of neutralization by the latter power. The treaty also omitted a clause previously insisted on, forbidding the fortification of the canal. Having thus cleared the way, the United States next debated the advantages of the Nicaragua and the Panama routes. Influenced by the cost of acquiring the rights and property of the French company, an American commission reported in 1901 in favour of the Nicaraguan route; but upon receiving information that a smaller sum would be accepted, the Spooner Law was enacted (June 28, 1902) authorizing the president to purchase the rights and property of the Panama Company for $40,000,000, to acquire upon reasonable terms the title and jurisdiction to a canal strip at least 6 m. wide from Colombia, and through the Isthmian Canal Commission to construct the canal. But if the president was unable to secure a valid title from the French company and the control from Colombia within "a reasonable time and upon reasonable terms" the Nicaraguan route was to be made the line of the canal. With this means of pressure the president acquired the French rights; but Colombia declined to ratify the treaty negotiated for the purpose of giving the United States the specified control, on the terms offered. In this emergency an insurrection broke out in Panama on the 3rd of November 1903. The naval force of the United States, acting under the theory that it was obliged to keep open the transit across the isthmus by its treaty obligations, excluded armed forces from the canal strip, and the Republic of Panama, having declared its independence of Colombia, was promptly recognized on the 6th of November. Twelve days later a treaty was negotiated with this republic, by which the United States paid Panama $10,000,000, together with an annuity of $250,000 to begin ten years later, and guaranteed the independence of the republic, receiving in exchange the substantial sovereignty and ownership of a ten-mile strip for the canal. This treaty was ratified by the Senate on the 23rd of February 1904, and excavation was begun in 1907. (See PANAMA CANAL.)

The Panama Canal.

391. In the Philippines early in 1901 municipal and provincial governments were provided for, and the president had been for a brief time granted full power to govern the archipelago. He appointed Judge Taft civil governor, and limited the power of the military governor to regions where insurrection continued. On the 1st of July 1902 Congressional authority was substituted for that of the president, but Taft remained governor. The provisions of the Constitution guaranteeing life, liberty and property were in general extended specifically to the dependency, and a legislative assembly was promised, the lower house elective, and the upper house to consist of the Philippine Commission. By negotiations with Rome Governor Taft secured for the Philippines the "friars' lands" which had been a source of friction. On the 16th of October 1907 the first Philippine assembly was convened in the presence of Taft, then secretary of war.

The Philippines.

392. The tariff question complicated American relations with both the Philippines and Cuba. Beet sugar and tobacco interests feared the competition of these products, and opposed freedom of trade between the United States and the new territories. The Philippine tariff of 1902 made a reduction of only 25% from the Dingley tariff in the case of the products of those islands, instead of the 75% urged by Taft; but the duties were to go to the Philippines. In the case of Cuba a more heated controversy arose over the tariff—Roosevelt strongly urged a substantial reduction in justice to Cuba at several regular and special sessions of Congress; but not until the close of 1903 was a treaty in operation which, under the principle of reciprocity, admitted some products of the United States to Cuba at reduced rates, and allowed Cuban products a reduction of 20% from the Dingley tariff, stipulating at the same time that so long as this arrangement continued no sugar should be admitted at reduced rates from any other country. This sacrifice of the means of reciprocity with sugar countries for the advantage of the beet sugar raisers of the West was quickly followed by the acquisition of preponderant interest in the beet sugar refineries by the Sugar Trust, which was thus able to control the domestic market; but for the time being it was evident that the forces friendly to the protective tariff had increased their following in important agricultural regions.

393. The dominant historical tendencies of the beginning of the 20th century in the United States, however, were characterized by huge combinations of capital and labour, the rapid passing of natural resources into private possession, and the exploitation of these resources on the principle of individualism by aggregations of capital which prevented effective competition by ordinary individuals. Pioneer conceptions of individual industrial achievement free from governmental restraint were adopted by huge monopolies, and the result was a demand for social control of these dangerous forces.

394. After the Sherman Anti-Trust Act of 1890 the combinations found in the favourable laws of states like New Jersey opportunity to incorporate under the device of the "holding company," which was supposed to be within the law. A "promotion mania" set in in 1901. The steel industry, after a threatened war between the Standard Oil and Carnegie groups, was united by Pierpont Morgan into the United States Steel Corporation with stocks and bonds aggregating $1,400,000,000. This was only one of the many combinations embracing public utilities of all kinds. Where open consolidation was not effected, secret agreements, as in the case of the meat packers, effectively regulated the market. In the field of railway transportation, Harriman used the bonds of the

Combinations of Capital.

Union Pacific to acquire the Southern Pacific with the Central Pacific, and by 1906 he was dictator of one-third of the total mileage of the United States. Meanwhile the Great Northern and the Northern Pacific had been brought into friendly working arrangements under James J. Hill, and tried to secure the Burlington railway. A fierce contest followed between the Hill, Morgan and Harriman forces, resulting in a compromise by which the Northern Securities Company, a holding company for the joint interests of the contestants, was created. It was admitted by the counsel for this company that the machinery provided in this organization would permit the consolidation of all the railways of the country in the hands of three or four individuals. By using notes of one railway company, based on its treasury securities, it was possible to acquire a controlling interest in others; and by watering the capital stock to recover the cost of the undertaking, while the public paid the added rates to supply dividends on the watered stock.

The Northern Securities Company.

395. Following a similar tendency the great Wall Street banking houses were dominated by the large financial groups in the interest of speculative undertakings, the directors of banks loaning to themselves, as directors of industrial combinations, the funds which flowed into New York from all the banks of the interior. By a similar process the great insurance and trust companies of New York became feeders to the same operations. Thus a community of control over the fundamental economic interests of the nation was lodged in a few hands. Rebates and discriminations by the railways gave advantage to the powerful shippers, and worked in the same direction.

396. Such was the situation in domestic affairs which confronted Roosevelt when he became president. In his first message he foreshadowed his determination to grapple with these problems. In 1903 he instructed the attorney-general to bring suit to dissolve the Northern Securities Company as a combination in restraint of trade, and in 1904 the Supreme Court held the merger illegal. But the effect was to increase the tendency to change from incomplete combination of financial interests to consolidated corporations owning the property, and to lead the government, on the other hand, to seek to regulate these vast business interests by legislation. The Elkins Law, passed in 1903, increased the power of the interstate commerce commission to prosecute offenders, especially those who violated the anti-rebating clauses. In the same year the creation of the Federal Bureau of Corporations provided for increased publicity in the affairs of these organizations.

The Elkins Law; the Bureau of Corporations.

397. Labour was combining in its turn. Not only did local unions in most of the trades increase in number and power, but workers in separate industries over large areas were combined for collective bargaining and the national organization, the American Federation of Labor, had a membership by 1905 of approximately 2,000,000. Labour legislation by the states increased under these influences, and political leaders became increasingly aware of the power of the labour vote, while employers began to form counter organizations to check the growth of the movement. In 1902 Pennsylvania members of the United Mine Workers of America, led by John Mitchell, struck. Inasmuch as their employers were the owners of the anthracite coal monopoly under the control of an allied group of coal-carrying railways, the contest was one of far-reaching importance, and soon brought about a coal famine felt throughout the nation. So threatening was the situation that President Roosevelt called a conference of the contestants, and succeeded in inducing them to submit their difficulties to an arbitration commission which, by its report, in the spring of 1903, awarded to the miners shorter hours and an increase of wages.

Combinations of Labour.

398. Steadily the United States enlarged its economic functions. In 1903 Congress created a Department of Commerce and Labor and made the secretary a member of the cabinet. The reports of this department gave publicity to investigations of the perplexing industrial conditions. The Department of Agriculture enlarged its staff and its activity, investigating diseases of plants and animals, ascertaining means of checking insect pests, advising upon the suitability of soils to crops, seeking new and better seeds, and circulating general information. The contemporaneous development of agricultural education in the various Western and Southern states whose agricultural colleges had been subsidized by land grants and appropriations by the Federal government, and the experimental farms conducted by railways, all worked to the same end. Congress passed acts to limit the substitution of oleomargarine for butter (1902) and provided for the limitation of the spread of live-stock diseases (1903). The nation began also to awake to the need of protecting its remaining forests, which were rapidly falling into the hands of corporations by perversion of homestead and other land laws. President Cleveland had withdrawn large forest tracts, and in 1898 Gifford Pinchot was made head of a division of forestry in the Department of Agriculture. In 1901 the work was organized under a separate bureau, and four years later the National Forests were placed under his management.

Economic Measures of the Federal Government.

399. The increasing demand for lands for agriculture led also, under Roosevelt, to the real beginning of national irrigation actively in the vast arid area of the Far West. The Reclamation Service was created by the act of the 17th of June 1902, which set aside the proceeds of the sale of public lands in thirteen states and three Territories as a fund for irrigation works. The government itself reserved timber and coal tracts, water powers and other requisites for construction, and sold the irrigated lands to actual settlers in small farms, while retaining title to the reservoirs and the works. The income from the reclamation fund between 1901 and 1910 aggregated over $60,000,000. By the use of suitable crops and dry farming agricultural occupation was extended into formerly desert lands.

The Reclamation Service.

When corruption was discovered in the Land Office and Post Office, Roosevelt, instead of yielding to the effort to conceal the scandal, compelled effective investigation. Two United States senators were convicted of land frauds. The application to all kinds of lands, whether coal lands, timber tracts, water rights or other natural resources, of the general principle of homesteads governing the acquisition of agricultural lands, had invited fraudulent entries. The Homestead Act of 1862, the Timber Culture Act of 1873, the Desert Land Act of 1877, the Stone and Timber Act of 1878 had all been used by corporations to secure great tracts of valuable land through employing men to homestead them, and the laws themselves were loosely enforced. In successive messages, and by reports of public land commissions, the administration urged the importance of readjusting the land laws for the protection of the public.

400. In the election of 1904 the popularity of President Roosevelt, after his strenuous activity in challenging some of the strongest tendencies in American life, was put to the test. His political management exhibited the fact that he was trained in the school of the New York politician as well as in the reformer's camp, and he was easily nominated by the Republicans on a platform which endorsed his administration, and made no promise of tariff changes. The Democrats turned to the conservative wing, omitted any reference to silver or the income tax, and nominated Judge Alton B. Parker, of New York. The radicals, who favoured William R. Hearst, the well-known newspaper proprietor, who was influential with the masses of large cities, were largely represented in the convention, but unable to poll a third of its vote. Parker accepted the nomination after telegraphing that he regarded the gold standard as irrevocably established. The issue of imperialism had been largely eliminated by the current of events and the anti-trust issue was professed by both parties. In the outcome Roosevelt won by the unprecedented popular plurality of over 2,500,000, and an electoral majority of 196.

Elections of 1904.

401. The state elections of the same period showed that a

wave of reform and of revolt against former political forces was rising. In five states which Roosevelt carried by his popularity the machine Republican candidates for governor were defeated by reforming Democratic candidates, and in cities like Chicago and Philadelphia the issues of reform and radicalism won unexpected though temporary success. Roosevelt had "stolen the thunder" of the parties of social unrest, including the old populistic areas of the Middle West and the labour element of the cities at the same time that he retained control of the Republican party machinery.

402. In his second administration President Roosevelt pressed his policies so hard and with such increasing radicalism that he lost control of the regular organization in Congress before the end of his term. In the House Speaker Joseph G. Cannon, of Illinois, exhibited the full power of his office in concentrating party policies in the hands of the few regular leaders, while in the Senate a directing group of New England men who had served for a long time, chiefly senators Nelson W. Aldrich and Eugene Hale, showed a similar mastery. Against this control a significant revolt, illustrative of revived discontent in the Middle West, was made by the Republican senator Robert M. La Follette, of Wisconsin, who had won his fight in that state against the faction friendly to the railways, and had secured primary elections, railway rate regulation on the basis of expert valuation of the physical property of the railways, and a system of taxation which rested more heavily upon public utilities. In pressing similar policies upon Congress he became isolated from the party leaders, but forced them to go on record by roll calls.

The President's Radicalism.

403. In New York a legislative investigation of the insurance companies disclosed such connexions with the high financiering of Wall Street as to create widespread distrust and to lead to reform legislation. The attorney who conducted the investigation, Charles Evans Hughes (b. 1862), had shown such ability that he was chosen governor of New York in 1906.[1] His administration was marked by independence of the party machine and a progressive policy. Foreign relations were conducted during the second administration of Roosevelt by Secretary Elihu Root from 1905. He fostered friendly relations with the other American nations, allaying their concern lest ambitious designs of their larger neighbour might endanger their independence. In Cuba a signal illustration of the good faith of the United States was exhibited when an insurrection in the summer of 1906 left the republic substantially without a government. Mr Taft, then secretary of war, was sent, under the treaty provisions for intervention, to organize a provisional government. During his few days' service as governor-general he set in motion the machinery for restoring order. But President Roosevelt had plainly stated that if the insurrectionary habit became confirmed in Cuba she could not expect to retain continued independence.

New York Insurance Investigation.

Cuba.

404. Attention was again fixed upon the Pacific coast, not only by the earthquake and conflagration which in 1906 destroyed the business parts and much of the residence section of San Francisco, but also by municipal regulations there against the presence of Japanese in the public schools. The incident seemed to threaten grave consequences, which were averted by the popularity of Roosevelt both in California and in Japan. In the Immigration Act of the 20th of February 1907 the problem of exclusion of Japanese labour, which underlay the difficulty, was partly solved by preventing the entrance to the continental United States by way of neighbouring countries of persons holding passports issued by a foreign government for going to other countries or dependencies of the United States. Since Japan discouraged its citizens from migrating directly to the United States this satisfied California.

Japanese Immigration.

405. As a demonstration of the naval power of the United States in Pacific waters, the President sent the American fleet on a cruise around the world, in the course of which they were received in a friendly spirit by Japan. The navy was increased to keep pace with the growth of that of other nations, both in numbers and size of vessels, in this period, but not to the extent demanded by the administration. Already a more efficient organization of both army and navy had been effected. While the nation prepared for war, it also engaged prominently in the successive international peace congresses between 1899 and 1907, aiming consistently to increase the use of arbitration.

406. The tendencies of the government to deal with social improvement were exemplified by the laws of 1906 providing for pure food and meat inspection. The Railway Rate Regulation Act of 1906 strengthened previous inter-state acts by including pipe lines (except for gas and water) under the jurisdiction of the Interstate Commerce Commission, and extending the meaning of "common carrier" to include express and sleeping-car companies. Published rate schedules were required, not to be changed without thirty days' notice, and more stringent provisions were made to prevent rebating. The act provided for review by the Federal courts, and did not permit the commission to investigate an increase of rates until the rates went into operation, nor did it provide for a valuation of the railways as a basis of rate-making which the commission had desired. Later acts partly met the demands of railway employés by increasing the liability of common carriers and by providing for shorter hours.

Railway Rate Regulation Act.

407. Although Roosevelt had made concessions to the railways in the formation of the act of 1906, his utterances showed a tendency alarming to the large business interests and the holders of corporation securities generally. The unsettled business conditions were reflected in the stock market, and began to produce a reaction against the activity of government in this direction. The panic of 1907 started with the downfall of an attempted combination of a chain of banks, copper interests and other enterprises of F. Augustus Heinze and Charles W. Morse, two daring operators in Wall Street, and was followed by the collapse of the Knickerbocker Trust Company (October 21, 1907). Already, in 1903, liquidation had begun in some of the stocks so actively issued in the preceding years. The leading New York banks failed to check speculation, however, and were even contributors to the movement up to the time of the panic. The country was generally prosperous, though much of the banking funds was tied up in New York City at this juncture. Clearing-house certificates were resorted to; by the 1st of November partial suspension was general throughout the nation; and banking facilities were more completely interrupted than at any time since the Civil War. The government greatly increased its deposits, and offered Panama 2% bonds to the amount of \$50,000,000, and 3% certificates for \$100,000,000, with the object of providing the national banks a basis for additional note issues. But these were taken only to a small amount, as they proved useful for their moral effect chiefly. An enormous addition to the money supply was made in the course of the panic, both by governmental activity, gold imports and national bank-notes. The crisis was brought to a close before the end of 1907 by the vigour of the government and the activity of the large financial interests under the lead of J. P. Morgan, who finally entered the field to stop the decline, at the same time that his associates in the Steel Trust acquired possession of their last remaining rival of importance, the Tennessee Coal & Iron Company.

Financial Panic of 1907.

408. The reaction after the panic, and the loss of influence resulting from his announcement that he would not permit his renomination for the campaign of 1908, left Roosevelt unable to exercise the compelling power which he had displayed in previous years. Congress under the control of the conservatives refused him legislation which he asked, but before he left the presidency he raised a new issue to national importance in his calling of a congress of state governors and experts to consider the need

Conservation.

[1] In 1910 Hughes was appointed a justice of the United States Supreme Court.

of the conservation of natural resources (see IRRIGATION: *United States*; and the article ROOSEVELT). This congress met in May 1908 and endorsed the proposal for vigorous attention by state and nation to the question.

409. In the campaign of 1908 he succeeded, against the opposition of both the extreme conservative and the radical wings, in procuring the nomination of Secretary Taft by the Republicans on a platform endorsing the Roosevelt policies, promising a revision of the tariff at a special session, on the basis of such protection as would equal the difference between the cost of production at home and abroad, together with a reasonable profit to American industries, and providing for maximum and minimum rates to be used in furthering American commerce and preventing discriminations by other nations. A postal bank was promised, a more effective regulation of the railways, and a modification of the Sherman Anti-Trust Act. Labour failed to secure a thoroughgoing pledge to prevent the use of the writ of injunction in labour disputes, but the convention promised legislation to limit its use. The Democrats again selected William J. Bryan as their candidate; demanded the enforcement of criminal law against "trust magnates" and such additional legislation as would prevent private monopoly; opposed the use of injunctions in cases where they would issue if no industrial dispute was involved; impugned the Republicans' good faith in tariff revision, promising for themselves a substantial reduction of duties; favoured an income tax and a guarantee fund by national banks to pay depositors of insolvent banks, or a postal savings bank, if the guaranteed bank could not be secured; demanded election of United States senators by direct vote of the people, legislation to prevent contributions by corporations to campaign funds, and a more efficient regulation of railways. The party also declared against centralization, favouring the use of both Federal and state control of interstate commerce and private monopoly.

William H. Taft, President.

410. The Republicans won a sweeping victory, Taft's popular plurality reaching about 1,270,000 and his electoral majority 159. But it had been won by some ambiguity of utterance with respect to tariff and railway regulation. The result was made manifest early in the new administration, when party contentions over the direction of revision of the tariff, the thoroughness of the regulation of railways and corporations, and the question of where the postal bank fund should be placed, resulted in a movement of "insurgency" among the Republicans of the Middle West. The insurgents termed themselves "Progressive Republicans," and did not hesitate to join forces with the Democrats in order to shape legislation to their wishes. Progressives and Democrats united in overturning the control of Speaker J. G. Cannon in the House of Representatives by modifying the rules, and a group of senators, chiefly from the Middle Western states, destroyed the control of the regular leaders in the Upper House. President Taft's influence over the revolting wing was further weakened by the charges made against his secretary of the interior, Richard A. Ballinger, on behalf of Gifford Pinchot, the chief forester, who accused the administration of obstructing Mr Roosevelt's "conservation" policy.

Roosevelt's "New Nationalism."

411. Mr Pinchot was indeed removed from office, but the "conservation" issue was raised to primary importance by the return of Mr Roosevelt from his African trip. His influence was revealed even while he was enjoying the hospitality of European countries on his return. There was a widely extended desire to know his judgment of the administration's policy; but he maintained silence until the close of the summer of 1910, when in a series of public utterances in the West he ranged himself, on the whole, with the progressive wing and announced a "new nationalism" which should enlarge the power of the Federal government and drive the "special interests" out of politics. The "insurgents" achieved remarkable victories in the Middle West, California, New Hampshire and New York in the fall conventions and primary elections, retiring various leaders of the regular wing of the Republicans. Senators Aldrich and Hale, former regular leaders in the Senate, had already announced their purpose to resign. President Taft's utterances indicated his intention to discontinue the use of patronage against the leaders of the progressive wing and to secure additional tariff revision by separate schedules. The result of the autumn elections was a pronounced victory for the Democratic party.

412. At the close of the first decade of the 20th century the United States was actively engaged in settling its social economic questions, with a tendency toward radicalism in its dealings with the great industrial forces of the nation. The "sweat shops" and slums of the great cities were filled with new material for American society to assimilate. To the sisterhood of states had been added Oklahoma (1907), and in 1910 Congress empowered New Mexico and Arizona to form constitutions preparatory to statehood, thus extinguishing the last Territories, except the insular dependencies and Alaska. Already the food supply showed signs of not keeping pace with the growth of population, while the supply of gold flowed in with undiminished volume. High prices became a factor in the political situation. Between 1890 and 1900, in the continental United States, farms were added in area equal to that of France and Italy combined. Even the addition of improved farm land in that decade surpassed the whole area of France or of the German Empire in Europe. But intensive cultivation and agricultural returns hardly kept pace with the growth in population or the extension of farms.

Bibliographical Guides.—J. N. Larned (ed.), *The Literature of American History* (Boston, 1902), is useful so far as it extends. The "Critical Essays on Authorities," in vols. xxi.–xxvi. (1907) of the "American Nation Series" (New York, 1903–1907), edited by A. B. Hart, constitute the best bibliographical apparatus for the whole period. W. Wilson, *History of the American People*, vol. v., has helpful evaluated lists of authorities. *The Cambridge Modern History*, vol. vii., has a useful unannotated list. Periodical literature, important for this era, can be found through the successive volumes of the *Index to Periodical Literature* (New York, 1882 sqq.), edited by W. F. Poole and W. J. Fletcher. Public documents are listed in B. P. Poore, *Descriptive Catalogue of Government Publications of the United States, 1775–1881* (Washington, 1885); J. G. Ames, *Comprehensive Index of Publications of the United States Government, 1881–1893* (Washington, 1894); *Catalogue of Public Documents of Congress and of all Departments of Government of the United States, 1893–1899*; *Tables of and Annotated Index to Congressional Series of United States Public Documents* (Washington, 1902). For economic material see the bibliographies in D. R. Dewey, *Financial History of the United States* (New York, 1902); E. L. Bogart, *Economic History of the United States* (ibid., 1907); F. A. Cleveland and F. W. Powell, *Railroad Promotion and Capitalization in the United States* (New York, 1909); and Miss A. R. Hasse's *Index of Economic Material in the Documents of the United States* (Washington, 1907 sqq.).

The Library of Congress publishes, under the editorship of A. P. C. Griffin, lists and references to books and articles on special subjects.

General Accounts.—Much the most satisfactory treatment is in the volumes of the "American Nation Series" mentioned above, such as W. A. Dunning, *Reconstruction, Political and Economic, 1865–1877*; E. E. Sparks, *National Development, 1877–1885*; D. R. Dewey, *National Problems, 1885–1897*; J. H. Latané, *America as a World Power*, and A. B. Hart, *National Ideals Historically Traced*. All these were published in 1907. The later volumes of J. F. Rhodes *History of the United States since the Compromise of 1850* (7 vols., New York, 1893–1904), cover the period from 1865 to 1876 with solid judgment and accuracy; Woodrow Wilson, *History of the American People*, vol. v. (New York, 1902), gives an informing presentation with a sympathetic treatment of Southern conditions. Lee and Thorpe (editors), *History of North America*, vols. xvi.–xx.; H. W. Elson, *History of the United States*, vols. iv and v. (New York, 1905), and J. W. Garner and H. C. Lodge, *History of the United States*, vol. iv. (Philadelphia, 1906), deal with the period as part of a general history. E. B. Andrews, *The United States in our own Time* (New York, 1903), and H. T. Peck, *Twenty Years of the Republic, 1885–1905* (New York, 1906), are popular presentations.

Documentary Sources.—The Congressional documents and state public documents afford valuable material. The Congressional debates have become too bulky for the general reader, but in the president's messages, as collected in J. D. Richardson (ed.), *Messages and Papers of the Presidents* (to 1899), the main questions are presented, and detailed information is in the reports of the heads of departments and bureaus. W. MacDonald, *Select Statutes of United States, 1861–1898* (New York, 1903), contains important laws, with brief historical introductions. (F. J. T.)

UNITED STATES NAVAL ACADEMY, an institution for the education of officers of the United States Navy, at Annapolis, Maryland, occupying about 200 acres on the banks of the Severn. Its principal buildings are the marine engineering building, the academic building (containing the library), the chapel, the gymnasium, the physics and chemistry building, the auditorium, the armoury, the power-house, the administration building, Bancroft Hall (the midshipmen's quarters), officers' mess and club, and Sampson Row, Upshur Row and Rodgers Row, the officers' quarters.[1] By an Act of Congress passed in 1903 two midshipmen (as the students have been called since 1902; "naval cadets" was the term formerly used) were allowed for each senator, representative, and delegate in Congress, two for the District of Columbia, and five each year at large; but after 1913 only one midshipman is to be appointed for each senator, representative and delegate in Congress. Candidates are nominated by their senator, representative, or delegate in Congress, and those from the District of Columbia and those appointed at large are chosen by the President; but to be admitted they must be between sixteen and twenty years of age and must pass an entrance examination. Each midshipman is paid $600 a year, beginning with the date of his admission; and he must bind himself to serve in the United States Navy for eight years (including the years spent in the academy) unless he is discharged sooner. The course of instruction is for four years—"final graduation" comes only after six years, the additional years being spent at sea—and is in eleven departments: discipline, seamanship, ordnance and gunnery, navigation, marine engineering and naval construction, mathematics and mechanics, physics and chemistry, electrical engineering, English, modern languages, naval hygiene and physiology. Vessels for practice work of midshipmen in the first, second, and third year classes are attached to the academy during the academic year, and from early in June to September of each year the midshipmen are engaged in practice cruises. The academy is governed by the Bureau of Navigation of the United States Navy Department, and is under the immediate supervision of a superintendent appointed by the secretary of the navy, with whom are associated the Commandant of Midshipmen, a disciplinary officer, and the Academic Board, which is composed of the superintendent and the head of each of the eleven departments. The institution was founded as the Naval School in 1845 by the secretary of the navy, George Bancroft, and was opened in October of that year. Originally a course of study for five years was prescribed, but only the first and last were spent at the school, the other three being passed at sea. The present name was adopted when the school was reorganized in 1850, being placed under the supervision of the chief of the Bureau of Ordnance and Hydrography, and under the immediate charge of the superintendent, and the course of study was extended to seven years; the first two and the last two to be spent at the school, the intervening three years to be passed at sea. The four years of study were made consecutive in 1851, and the practice cruises were substituted for the three consecutive years at sea. At the outbreak of the Civil War the three upper classes were detached and were ordered to sea, and the academy was removed to Fort Adams, Newport, Rhode Island (May 1861), but it was brought back to Annapolis in the summer of 1865. The supervision of the academy was transferred from the Bureau of Ordnance and Hydrography to the Bureau of Navigation when that bureau was established in 1862; and, although it was placed under the direct care of the Navy Department in 1867, it has been (except in 1869–1889) under the Bureau of Navigation for administrative routine and financial management. The Spanish-American War greatly emphasized its importance, and the academy was almost wholly rebuilt and much enlarged in 1899–1906.

[1] The old quarters of the superintendent, a colonial house, once the official residence of the governors of Maryland, was destroyed in 1900. In 1909 old Fort Severn, a small circular structure with thick walls, built in 1809, was torn down.

See J. R. Soley, *Historical Sketch of the United States Naval Academy* (Washington, 1876); Park Benjamin, *The United States Naval Academy* (New York, 1900); Randall Blackshaw, "The New Naval Academy," in the *Century Magazine* for October 1905.

UNITS, DIMENSIONS OF. Measurable entities of different kinds cannot be compared directly. Each one must be specified in terms of a unit of its own kind; a single number attached to this unit forms its measure. Thus if the unit of length be taken to be L centimetres, a line whose length is l centimetres will be represented in relation to this unit by the number l/L; while if the unit is increased [L] times, that is, if a new unit is adopted equal to [L] times the former one, the numerical measure of each length must in consequence be divided by [L]. Measurable entities are either fundamental or derived. For example, velocity is of the latter kind, being based upon a combination of the fundamental entities length and time; a velocity may be defined, in the usual form of language expressive of a limiting value, as the rate at which the distance from some related mark is changing per unit time. The element of length is thus involved directly, and the element of time inversely in the derived idea of velocity; the meaning of this statement being that when the unit of length is increased [L] times and the unit of time is increased [T] times, the numerical value of any given velocity, considered as specified in terms of the units of length and time, is diminished [L]/[T] times. In other words, these changes in the units of length and time involve change in the unit of velocity determined by them, such that it is increased [V] times where $[V]=[L][T]^{-1}$. This relation is conveniently expressed by the statement that velocity is of $+1$ dimension in length and of -1 dimension in time. Again, acceleration of motion is defined as rate of increase of velocity per unit time; hence the change of the units of length and time will increase the corresponding or derived unit of acceleration [V]/[T] times, that is $[L][T]^{-2}$ times: this expression thus represents the dimensions (1 in length and -2 in time) of the derived entity acceleration in terms of its fundamental elements length and time. In the science of dynamics all entities are derived from the three fundamental ones, length, time and mass; for example, the dimensions of force (P) are those of mass and acceleration jointly, so that in algebraic form $(P)=[M][L][T]^{-2}$. This restriction of the fundamental units to three must therefore be applicable to all departments of physical science that are reducible to pure dynamics.

The mode of transformation of a derived entity, as regards its numerical value, from one set of fundamental units of reference to another set, is exhibited in the simple illustrations above given. The procedure is as follows. When the numerical values of the new units, expressed in terms of the former ones, are substituted for the symbols, in the expression for the dimensions of the entity under consideration, the number which results is the numerical value of the new unit of that entity in terms of the former unit: thus all numerical values of entities of this kind must be divided by this number, in order to transfer them from the former to the latter system of fundamental units.

As above stated, physical science aims at reducing the phenomena of which it treats to the common denomination of the positions and movements of masses. Before the time of Gauss it was customary to use a statical measure of force, alongside the kinetic measure depending on the acceleration of motion that the force can produce in a given mass. Such a statical measure could be conveniently applied by the extension of a spring, which, however, has to be corrected for temperature, or by weighing against standard weights, which has to be corrected for locality. On the other hand, the kinetic measure is independent of local conditions, if only we have absolute scales of length and time at our disposal. It has been found to be indispensable, for simplicity and precision in physical science, to express the measure of force in only one way; and statical forces are therefore now generally referred in theoretical discussions to the kinetic unit of measurement. In mechanical engineering the static unit has largely survived; but the increasing importance of electrical applications is introducing uniformity there also. In the science of electricity two different systems of units, the electrostatic and the electrodynamic, still to a large extent persist. The electrostatic system arose because in the development of the subject statics came before kinetics; but in the complete synthesis it is usually found convenient to express the various quantities in terms of the electrokinetic system alone.

The system of measurement now adopted as fundamental in physics takes the centimetre as unit of length, the gramme as unit of mass, and the second as unit of time. The choice of these units was in the first instance arbitrary and dictated by convenience; for some purposes subsidiary systems based on multiples of these units by certain powers of ten are found convenient. There are certain absolute entities in nature, such as the constant of gravitation, the velocity of light in free space, and the constants occurring in the expression giving the constitution of the radiation in an enclosure that corresponds to each temperature, which are the same for all kinds of matter; these might be utilized, if known with sufficient accuracy, to establish a system of units of an absolute or cosmical kind. The wave-length of a given spectral line might be utilized in the same manner, but that depends on recovering the kind of matter which produces the line.

In physical science the uniformities in the course of phenomena are elucidated by the discovery of permanent or intrinsic relations between the measurable properties of material systems. Each such relation is expressible as an equation connecting the numerical values of entities belonging to the system. Such an equation, representing as it does a relation between actual things, must remain true when the measurements are referred to a new set of fundamental units. Thus, for example, the kinematical equation $v^2=nf^2l$, if n is purely numerical, contradicts the necessary relations involved in the definitions of the entities velocity, acceleration, and length which occur in it. For on changing to a new set of units as above the equation should still hold; it, however, then becomes $v^2/[V]^2=n\cdot f^2/[F]^2\cdot l/[L]$. Hence on division there remains a dimensional relation $[V]^2=[F]^2[L]$, which is in disagreement with the dimensions above determined of the derived units that are involved in it. The inference follows, either that an equation such as that from which we started is a formal impossibility, or else that the factor n which it contains is not a mere number, but represents n times the unit of some derived quantity which ought to be specified in order to render the equation a complete statement of a physical relation. On the latter hypothesis the dimensions $[N]$ of this quantity are determined by the dimensional equation $[V]^2=[N][F]^2[L]$ where, in terms of the fundamental units of length and time, $[V]=[L][T]^{-1}$, $[F]=[L][T]^{-2}$; whence by substitution it appears that $[N]=[L]^{-1}[T]^2$. Thus, instead of being merely numerical, n must represent in the above formula the measure of some physical entity, which may be classified by the statement that it has the conjoint dimensions of time directly and of velocity inversely.

It often happens that a simple comparison of the dimensions of the quantities which determine a physical system will lead to important knowledge as to the necessary relations that subsist between them. Thus in the case of a simple pendulum the period of oscillation τ can depend only on the angular amplitude α of the swing, the mass m of the bob considered as a point, and the length l of the suspending fibre considered as without mass, and on the value of g the acceleration due to gravity, which is the active force; that is, $\tau=f(\alpha, m, l, g)$. The dimensions must be the same on both sides of this formula, for, when they are expressed in terms of the three independent dynamical quantities mass, length, and time, there must be complete identity between its two sides. Now, the dimensions of g are $[L][T]^{-2}$; and when the unit of length is altered the numerical value of the period is unaltered, hence its expression must be restricted to the form $f(\alpha, m, l/g)$. Moreover, as the period does not depend on the unit of mass, the form is further reduced to $f(a, l/g)$; and as it is of the dimensions $+1$ in time, it must be a multiple of $(l/g)^{\frac{1}{2}}$, and therefore of the form $\phi(a)\sqrt{(l/g)}$. Thus the period of oscillation has been determined by these considerations except as regards the manner in which it depends on the amplitude a of the swing. When a process of this kind leads to a definite result, it will be one which makes the unknown quantity jointly proportional to various powers of the other quantities involved; it will therefore shorten the process if we assume such an expression for it in advance, and find whether it is possible to determine the exponents definitely and uniquely so as to obtain the correct dimensions. In the present example, assuming in this way the relation $\tau=\mathrm{A}a^pm^ql^rg^s$, where A is a pure numeric, we are led to the dimensional equation $[T]=[a]^p[M]^q[L]^r[LT^{-2}]^s$, showing that the law assumed would not persist when the fundamental units of length, mass, and time are altered, unless $q=0$, $s=-\frac{1}{2}$, $r=\frac{1}{2}$; as an angle has no dimensions, being determined by its numerical ratio to the *invariable* angle forming four right angles, p remains undetermined. This leads to the same result, $\tau=\phi(a)l^{+\frac{1}{2}}g^{-\frac{1}{2}}$, as before.

As illustrating the power and also the limitations of this method of dimensions, we may apply it (after Lord Rayleigh, *Roy. Soc. Proc.*, March 1900) to the laws of viscosity in gases. The dimensions of viscosity (μ) are (force/area) ÷ (velocity/length), giving $[ML^{-1}T^{-1}]$ in terms of the fundamental units. Now, on the dynamical theory of gases viscosity must be a function of the mass m of a molecule, the number n of molecules per unit volume, their velocity of mean square v, and their effective radius a; it can depend on nothing else. The equation of dimensions cannot supply more than *three* relations connecting these four possibilities of variation, and so cannot here lead to a definite result without further knowledge of the physical circumstances. And we remark conversely, in passing, that wherever in a problem of physical dynamics we know that the quantity sought can depend on only three other quantities whose dynamical dimensions are known, it must vary as a simple power of each. The additional knowledge required, in order to enable us to proceed in a case like the present, must be of the form of such an equation of simple variation. In the present case it is involved in the new fact that in an actual gas the mean free path is very great compared with the effective molecular radius. On this account the mean free path is inversely as the number of molecules per unit volume; and therefore the coefficient of viscosity, being proportional to these two quantities jointly, is independent of either, so long as the other quantities defining the system remain unchanged. If the molecules are taken to be spheres which exert mutual action only during collision, we therefore assume

$$\mu\propto m^x\bar{v}^ya^z,$$

which requires that the equation of dimensions

$$[ML^{-1}T^{-1}]=[M]^x[LT^{-1}]^y[L]^z$$

must be satisfied. This gives $x=1$, $y=1$, $z=-2$. As the temperature is proportional to $m\bar{v}^2$, it follows that the viscosity is proportional to the square root of the mass of the molecule and the square root of the absolute temperature, and inversely proportional to the square of the effective molecular radius, being, as already seen, uninfluenced by change of density.

If the atoms are taken to be Boscovichian points exerting mutual attractions, the effective diameter a is not definite; but we can still proceed in cases where the law of mutual attraction is expressed by a simple formula of variation—that is, *provided* it is of type km^2r^s, where r is the distance between the two molecules. Then, noting that, as this is a force, the dimensions of k must be $(M^{-1}L^{s+1}T^{-2}]$, we can assume

$$\mu\propto m^x\bar{v}^yk^w,$$

provided $$[ML^{-1}T^{-1}]=[M]^x[LT^{-1}]^y[M^{-1}L^{s+1}T^{-2}]^w,$$

which demands and is satisfied by

$$x-w=1,\ y+2w=1,\ y+(s+1)w=-1,$$

so that $$w=-\frac{2}{s-1},\ y=\frac{s+3}{s-1},\ x=\frac{s-3}{s-1}.$$

Thus, on this supposition,

$$\mu\propto m^{\frac{s-9}{2s-2}}k^{-\frac{2}{s-1}}\theta^{\frac{s+3}{2s-2}}$$

where θ represents absolute temperature. (See DIFFUSION.)

When the quantity sought depends on more than three others, the method may often be equally useful, though it cannot give a complete result. Cf. Sir G. G. Stokes, *Math. and Phys. Papers*, v. (1881) p. 106, and Lord Rayleigh, *Phil. Mag.* (1905), (1) p. 494, for examples dealing with the determination of viscosity from observations of the retarded swings of a vane, and with the formulation of the most general type of characteristic equation for gases respectively. As another example we may consider what is involved in Bashforth's experimental conclusion that the air-resistances to shot of the same shape are proportional to the squares of their linear dimensions. *A priori*, the resistance is a force which is determined by the density of the air ρ, the linear dimensions l of the shot, the viscosity of the air μ, the velocity of the shot v, and the velocity of sound in air c, there being no other physical quantity sensibly involved. Five elements are thus concerned, and we can combine them in two ways so as to obtain quantities of no dimensions; for example, we may choose $\rho vl/\mu$ and v/c. The resistance to the shot must therefore be of the form $\mu^x \rho^y v^z \phi(\rho vl/\mu) f(v/c)$, this form being of sufficient generality, as it involves an undetermined function for each element beyond three. On equating dimensions we find $x=2$, $y=-1$, $z=0$. Now, Bashforth's result shows that $\phi(\chi)=\chi^2$. Therefore the resistance is $\rho v^2 l^2 f(v/c)$, and is thus to our degree of approximation independent of the viscosity. Moreover, we might have assumed this practical independence straight off, on known hydrodynamic grounds; and then the argument from dimensions could have predicted Bashforth's law, if the present application of the doctrine of dimensions to a case involving turbulent fluid motion not mathematically specifiable is valid. One of the important results drawn by Osborne Reynolds from his experiments on the *régime* of flow in pipes was a confirmation of its validity: we now see that the ballistic result furnishes another confirmation.

In electrical science two essentially distinct systems of measurement were arrived at according as the development began with the phenomena of electrostatics or those of electrokinetics. An electric charge appears as an entity having different dimensions in terms of the fundamental dynamical units in the two cases: the ratio of these dimensions proves to be the dimensions of a velocity. It was found, first by W. Weber, by measuring the same charge by its static and its kinetic effects, that the ratio of the two units is a velocity sensibly identical with the velocity of light, so far as regards experiments conducted in space devoid of dense matter. The emergence of a definite absolute velocity such as this, out of a comparison of two different ways of approaching the same quantity, entitles us to assert that the two ways can be consolidated into a single dynamical theory only by some development in which this velocity comes to play an actual part. Thus the hypothesis of the mere existence of some complete dynamical theory was enough to show, in the stage which electrical science had reached under Gauss and Weber, that there is a definite physical velocity involved in and underlying electric phenomena, which it would have been hardly possible to imagine as other than a velocity of propagation of electrical effects of some kind. The time was thus ripe for the reconstruction of electric theory by Faraday and Maxwell.

The power of the method of dimensions in thus revealing general relations has its source in the hypothesis that, however complicated in appearance, the phenomena are really restricted within the narrow range of dependence on the three fundamental entities. The proposition is also therein involved, that if a changing physical system be compared with another system in which the scale is altered in different ratios as regards corresponding lengths, masses, and times, then if all quantities affecting the second system are altered from the corresponding quantities affecting the first in the ratios determined by their physical dimensions, the stage of progress of the second system will always correspond to that of the first; under this form the application of the principle, to determine the correlations of the dynamics of similar systems, originated with Newton (*Principia*, lib. ii. prop. 32). For example, in comparing the behaviour of an animal with that of another animal of the same build but on a smaller scale, we may take the mass per unit volume and the muscular force per unit sectional area to be the same for both; thus [L], [M], . . . being now ratios of corresponding quantities, we have $[ML^{-3}]=1$ and $[ML^{-1}T^{-2}]=1$, giving $[L]=[T]$; thus the larger animal effects movements of his limbs more slowly in simple proportion to his linear dimensions, while the velocity of movement is the same for both at corresponding stages.

But this is only on the hypothesis that the extraneous force of gravity does not intervene, for that force does not vary in the same manner as the muscular forces. The result has thus application only to a case like that of fishes in which gravity is equilibrated by the buoyancy of the water. The effect of the inertia of the water, considered as a perfect fluid, is included in this comparison; but the forces arising from viscosity do not correspond in the two systems, so that neither system may be so small that viscosity is an important agent in its motion. The limbs of a land animal have mainly to support his weight, which varies as the cube of his linear dimensions, while the sectional areas of his muscles and bones vary only as the square thereof. Thus the diameters of his limbs should increase in a greater ratio than that of his body—theoretically in the latter ratio raised to the power $\frac{3}{2}$, if other things were the same. An application of this principle, which has become indispensable in modern naval architecture, permits the prediction of the behaviour of a large ship from that of a small-scale model. The principle is also of very wide utility in unravelling the fundamental relations in definite physical problems of such complexity that complete treatment is beyond the present powers of mathematical analysis; it has been applied, for example, to the motions of systems involving viscous fluids, in elucidation of wind and waves, by Helmholtz (*Akad. Berlin*, 1873 and 1889), and in the electrodynamics of material atomic systems in motion by Lorentz and by Larmor.

As already stated, the essentials of the doctrine of dimensions in its most fundamental aspect, that relating to the comparison of the properties of correlated systems, originated with Newton. The explicit formulation of the idea of the *dimensions*, or the *exponents of dimension*, of physical quantities was first made by Fourier, *Théorie de la chaleur*, 1822, ch. ii. sec. 9; the homogeneity in dimensions of all the terms of an equation is insisted on by him, much as explained above; and the use of this principle as a test of accuracy and precision is illustrated. (J. L.*)

UNITS, PHYSICAL. In order that our acquaintance with any part of nature may become exact we must have not merely a qualitative but a quantitative knowledge of facts. Hence the moment that any branch of science begins to develop to any extent, attempts are made to measure and evaluate the quantities and effects found to exist. To do this we have to select for each measurable magnitude a *unit* or standard of reference (Latin, *unitas*, unity), by comparison with which amounts of other like quantities may be numerically defined. There is nothing to prevent us from selecting these fundamental quantities, in terms of which other like quantities are to be expressed, in a perfectly arbitrary and independent manner, and as a matter of fact this is what is generally done in the early stages of every science. We may, for instance, choose a certain length, a certain volume, a certain mass, a certain force or power as our units of length, volume, mass, force or power, which have no simple or direct relation to each other. Similarly we may select for more special measurements any arbitrary electric current, electromotive force, or resistance, and call them our units. The progress of knowledge, however, is greatly assisted if all the measurable quantities are brought into relation with each other by so selecting the units that they are related in the most simple manner, each to the other and to one common set of measurable magnitudes called the *fundamental quantities*.

The progress of this co-ordination of units has been greatly aided by the discovery that forms of physical energy can be converted into one another, and that the conversion is by definite rule and amount (see ENERGY). Thus the mechanical energy associated with moving masses can be converted into heat, hence heat can be measured in mechanical energy units. The amount of heat required to raise one gramme of water through 1° C. in the neighbourhood of 10° C. is equal to forty-two million *ergs*, the *erg* being the kinetic energy or energy of motion associated with a mass of 2 grammes when moving uniformly, without rotation, with a velocity of 1 cm. per second. This number is commonly called the "mechanical equivalent of heat," but would be more exactly described as the "mechanical equivalent of the specific heat of water at 10° C." Again, the fact that the maintenance of an electric current requires energy, and that when produced its energy can be wholly utilized in heating a mass of water, enables us to make a similar statement about the energy required to maintain a current of one ampere through a resistance of one ohm for one second, and to define it by its equivalent in the energy of a moving mass. Physical units have therefore been selected with the object of establishing simple relations between each of them and the fundamental mechanical units. Measurements based on such relations are called *absolute measurements*. The science of dynamics, as far as that part of it is concerned which deals with the motion and energy of material substances, starts from certain primary definitions concerning the measurable quantities involved. In constructing a system of physical units, the first thing to consider is the manner in which we shall connect the various items. What, for instance, shall be the unit of force, and how shall it be determined by simple reference to the units of mass, length and time?

The modern absolute system of physical measurement is founded upon dynamical notions, and originated with C. F. Gauss. We are for the most part concerned in studying motions in nature; and even when we find bodies at rest in equilibrium it is because the causes of motion are balanced rather than absent. Moreover, the postulate which lies at the base of all present-day study of physics is that in the ultimate issue we must seek for a mechanical explanation of the facts of nature if we are to reach any explanation intelligible to the human mind. Accordingly the root of all science is the knowledge of the laws of motion, and the enunciation of these laws by Newton laid the foundation of a more exact knowledge of nature than had been possible before. Our fundamental scientific notions are those of *length*, *time*, and *mass*. No metaphysical discussion has been able to resolve these ideas into anything simpler or to derive them from each other. Hence in selecting units for physical measurements we have first to choose units for the above three quantities.

Fundamental Units.—Two systems of fundamental units are in common use: the British system, having the yard and pound as the standard units of length and mass, frequently termed the "foot-pound-second" (F.P.S.) system; and the "centimetre-gramme-second" system (C.G.S.), having the centimetre and gramme as standard units of length and mass, termed the "metric" system. The fundamental unit of time is the same in both systems, namely, the "mean solar second," 86,400 of which make 1 solar day (see TIME). Since these systems and the corresponding standards, together with their factors of conversion, are treated in detail in the article WEIGHTS AND MEASURES, we need only deal here with such units as receive special scientific use, *i.e.* other than in ordinary commercial practice. The choice of a unit in which to express any quantity is determined by the magnitude and proportional error of the measurement. In astronomy, where immense distances have to be very frequently expressed, a common unit is the mean radius of the earth's orbit, the "astronomical unit" of length, *i.e.* 92,900,000 miles. But while this unit serves well for the region of our solar system, its use involves unwieldy numerical coefficients when stellar distances are to be expressed. Astronomers have therefore adopted a unit of length termed the "light year," which is the distance traversed by light in a year; this unit is 63,000 times the mean radius of the earth's orbit. The relative merits of these units as terms in which astronomical distances may be expressed is exhibited by the values of the distance of the star α Centauri from our earth, namely, 25,000,000,000,000 miles = 275,000 astronomical units = 4·35 light years.

As another example of a physical unit chosen as a matter of convenience, we may refer to the magnitudes of the wave-lengths of light. These quantities are extremely small, and admit of correct determination to about one part in ten-thousand, and range, in the visible spectrum, from about 6 to 4 ten-millionths of a metre. Since their values are determined to four significant figures, it is desirable to choose a unit which represents the value as an integer number; the unit is therefore a ten-thousand-millionth of a metre, termed a "tenth metre," since it is 10^{-10} metres. Sometimes the thousand-millionth of a metre, the "micromillimetre," denoted by $\mu\mu$, serves as a unit for wave lengths. Another relatively minute unit is the "micron," denoted by μ, and equal to one-millionth of a metre; it is especially used by bacteriologists.

Units in Mechanics.—The quantities to be measured in mechanics (*q.v.*) are velocity and acceleration, dependent on the units of length and time only, momentum, force, energy or work and power, dependent on the three fundamental units. The unit of velocity in the British system is 1 foot, 1 yard, or 1 mile per second; or the time to which the distance is referred may be expressed in hours, days, &c., the choice depending upon the actual magnitude of the velocity or on custom. Thus the muzzle velocity of a rifle or cannon shot is expressed in feet per second, whereas the speed of a train is usually expressed in miles per hour. Similarly, the unit on the metric system is 1 metre, or any decimal multiple thereof, per second, per hour, &c. Since acceleration is the rate of increase of velocity per unit time, it is obvious that the unit of acceleration depends solely upon the units chosen to express unit velocity; thus if the unit of velocity be one foot per second, the unit of acceleration is one foot per second per second, if one metre per second the unit is one metre per second per second, and similarly for other units of velocity. Momentum is defined as the product of mass into velocity; unit momentum is therefore the momentum of unit mass into unit velocity; in the British system the unit of mass may be the pound, ton, &c., and the unit of velocity any of those mentioned above; and in the metric system, the gramme, kilogramme, &c., may be the unit of mass, while the metre per second, or any other metric unit of velocity, is the remaining term of the product.

Force, being measured by the change of momentum in unit time, is expressed in terms of the same units in which unit momentum is defined. The common British unit is the "poundal," the force which in one second retards or accelerates the velocity of a mass of one pound by one foot per second. The metric (and scientific) unit, named the "dyne," is derived from the centimetre, gramme, and second. The poundal and dyne are related as follows:—1 poundal = 13,825·5 dynes.

A common unit of force, especially among engineers, is the "weight of one pound," by which is meant the force equivalent to the gravitational attraction of the earth on a mass of one pound. This unit obviously depends on gravity; and since this varies with the latitude and height of the place of observation (see EARTH, FIGURE OF), the "force of one pound" of the engineer is not constant. Roughly, it equals 32·17 poundals or 980 dynes. The most frequent uses of this engineer's unit are to be found in the expressions for pressure, especially in the boilers and cylinders of steam engines, and in structures, such as bridges, foundations of buildings, &c. The expression takes the form: pounds per square foot or inch, meaning a force equivalent to so many pounds' weight distributed over a square foot or inch, as the case may be. Other units of pressure (and therefore special units of force) are the "atmosphere" (abbreviated "atmo"), the force exerted on unit area by the column of air vertically above it; the "millimetre or centimetre of mercury," the usual scientific units, the force exerted on unit area by a column of mercury one millimetre or centimetre high; and the "foot of water," the column being one foot of water. All these units admit of ready conversion:—1 atmo = 760 mm. mercury = 32 feet of water = 1,013,600 dynes.

Energy of work is measured by force acting over a distance. The scientific unit is the "erg," which is the energy expended when a force of one dyne acts over one centimetre. This unit is too small for measuring the quantity of energy associated, for instance, with engines; for such purposes a unit ten-million times as great, termed the "joule," is used. The British absolute unit is the "poundal-foot." As we noticed in the case of units of force, common-life experience has led to the introduction of units dependent on gravitation, and therefore not invariable: the common British practical unit of this class is the "foot-pound"; in the metric system its congener is the "kilogramme-metre."

Power is the rate at which force does work; it is therefore expressed by "units of energy per second." The metric unit in use is the "watt," being the rate equal to one joule per second. Larger units in practical use are: "kilowatt," equal to 1000 watts; the corresponding energy unit being the kilowatt-second, and 3600 kilowatt-seconds or 1 kilowatt-hour called a "Board of Trade unit" or a "kelvin." This last is a unit of energy, not power. In British engineering practice the common unit of power is the "horse-power" (HP), which equals 550 foot-pounds performed per second, or 33,000 foot-pounds per minute; its equivalent in the metric system is about 746 watts, the ratio varying, however, with gravity.

Units of Heat.—In studying the phenomena of heat, two measurable quantities immediately present themselves:—(1) temperature or thermal potential, and (2) quantity of heat. Three arbitrary scales are in use for measuring temperature (see THERMOMETRY), and each of these scales affords units suitable for the expression of temperature. On the Centigrade scale the unit, termed a "Centigrade degree," is one-hundredth of the interval between the temperature of water boiling under normal barometric pressure (760 mm. of mercury) and that of melting ice; the "Fahrenheit degree" is one-hundred-and-eightieth, and the "Réaumur degree" is one-eightieth of the same difference. In addition to these scales there is the "thermo-dynamic scale," which, being based on dynamical reasoning, admits of correlation with the fundamental units. This subject is discussed in the articles THERMODYNAMICS and THERMOMETRY.

Empirical units of "quantity of heat" readily suggest themselves as the amount of heat necessary to heat a unit mass of any substance through unit temperature. In the metric system the unit, termed a "calorie," is the quantity of heat required to raise a gramme of water through one degree Centigrade. This quantity, however, is not constant, since the specific heat of water varies with temperature (see CALORIMETRY). In defining the calorie, therefore, the particular temperatures must be specified; consequently there are several calories particularized by special designations:—(1) conventional or common gramme-calorie, the heat required to raise 1 gramme of water between 15° C. and 17° C. through 1° C.; (2) "mean or average gramme calorie," one-hundredth of the total heat required to raise the temperature of 1 gramme of water from 0° C. to 100° C.; (3) "zero gramme calorie," the heat required to raise 1 gramme of water from 0° C. to 1° C. These units are thus related:—1 common calorie = 1·987 mean calories = 0·992 zero calories. A unit in common use in thermo-chemistry is the *major calorie*, which refers to one kilogramme of water and 1° C. In the British system the common unit, termed the "British Thermal Unit" (B.Th.U.), is the amount of heat required to raise one pound of water through one degree Fahrenheit.

A correlation of these units of quantity of heat with the fundamental units of mass, length and time attended the recognition of the fact that heat was a form of energy; and their quantitative relationships followed from the experimental determinations of the so-called "mechanical equivalent of heat," *i.e.* the amount of mechanical energy, expressed in ergs, joules, or foot-pounds, equivalent to a certain quantity of heat (cf. CALORIMETRY). These results show that a gram-calorie is equivalent to about 4·2 joules, and a British thermal unit to 780 foot-pounds.

Electrical Units.—The next most important units are the electrical units. We are principally concerned in electrical work with three quantities called respectively, electric current, electromotive force, and resistance. These are related to one another by Ohm's law, which states that the electric current in a circuit is directly as the electromotive force and inversely as the resistance, when the current is unvarying and the temperature of the circuit constant. Hence if we choose units for two of these quantities, the above law defines the unit for the third. Much discussion has taken place over this question. The choice is decided by the nature of the quantities themselves. Since resistance is a permanent quality of a substance, it is possible to select a certain piece of wire or tube full of mercury, and declare that its resistance shall be the unit of resistance, and if the substance is permanent we shall possess an unalterable standard or unit of resistance. For these reasons the practical unit of resistance, now called the international ohm, has been selected as one of the above three electrical units.

It has now been decided that the second unit shall be the unit of electric current. As an electric current is not a thing, but a process, the unit current can only be reproduced when desired. There are two available methods for creating a standard or unit electric current. If an unvarying current is passed through a neutral solution of silver nitrate it decomposes or electrolyses it and deposits silver upon the negative pole or cathode of the electrolytic cell. According to Faraday's law and all subsequent experience, the same current deposits in the same time the same mass of silver. Hence we may define the unit current by the mass of silver it can liberate per second. Again, an electric current in one circuit exerts mechanical force upon a magnetic pole or a current in another circuit suitably placed, and we may measure the force and define by it a unit electric current. Both these methods have been used. Thirdly, the unit of electromotive force may be defined as equal to the difference of potential between the ends of the unit of resistance when the unit of current flows in it.

Absolute electrical units.

Apart, however, from the relation of these electrical units to each other, it has been found to be of great importance to establish a simple relation between the latter and the absolute mechanical units. Thus an electric current which is passed through a conductor dissipates its energy as heat, and hence creates a certain quantity of heat per unit of time. Having chosen our units of energy and related unit of quantity of heat, we must so choose the unit of current that when passed through the unit of resistance it shall dissipate 1 unit of energy in 1 unit of time.

British Association units.

A further consideration has weight in selecting the size of the units, namely, that they must be of convenient magnitude for the ordinary measurements. The founders of the modern system of practical electrical units were a committee appointed by the British Association in 1861, at the suggestion of Lord Kelvin, which made its first report in 1862 at Cambridge (see *B. A. Report*). The five subsequent reports containing the results of the committee's work, together with a large amount of most valuable matter on the subject of electric units, were collected in a volume edited by Prof. Fleeming Jenkin in 1873, entitled *Reports of the Committee on Electrical Standards.* This committee has continued to sit and report annually to the British Association since that date. In their second report in 1863 (see *B.A. Report*, Newcastle-on-Tyne) the committee recommended the adoption of the absolute system of electric and magnetic units on the basis originally proposed by Gauss and Weber, namely, that these units should be derived from the fundamental dynamical units, but assuming the units of length, mass and time to be the metre, gramme and second instead of the millimetre, milligramme and second as proposed by Weber. Considerable differences of opinion existed as to the choice of the fundamental units, but ultimately a suggestion of Lord Kelvin's was adopted to select the centimetre, gramme, and second, and to construct a system of electrical units (called the C.G.S. system) derived from the above fundamental units. On this system the unit of force is the *dyne* and the unit of work the *erg*. The dyne is the uniform force which when acting on a mass of 1 gramme for 1 second gives it a velocity of 1 centimetre per second. The erg is the work done by 1 dyne when acting through a distance of 1 centimetre in its own direction. The electric and magnetic units were then derived, as previously suggested by Weber, in the following manner: If we consider two very small spheres placed with centres 1 centimetre apart in air and charged with equal quantities of electricity, then if the force between these bodies is 1 dyne each sphere is said to be charged with 1 unit of electric quantity on the electrostatic system. Again, if we consider two isolated magnetic poles of equal strength and consider them placed 1 centimetre apart in air, then if the force between them is 1 dyne these poles are said to have a strength of 1 unit on the electromagnetic system. Unfortunately the committee did not take into account the fact that in the first case the force between the electric charges depends upon and varies inversely as the dielectric constant of the medium in which the experiment is made, and in the second case it depends upon the magnetic permeability of the medium in which the magnetic poles exist. To put it in other words, they assume that the dielectric constant of the circumambient medium was unity in the first case, and that the permeability was also unity in the second case.

The result of this choice was that two systems of measurement were created, one depending upon the unit of electric quantity so chosen, called the *electrostatic system*, and the other depending upon the unit magnetic pole defined as above, called the *electromagnetic system* of C.G.S. units. Moreover, it was found that in neither of these systems were the units of very convenient magnitude. Hence, finally, the committee adopted a third system of units called the practical system, in which convenient decimal multiples or fractions of the electromagnetic units were selected and named for use. This system, moreover, is not only consistent with itself, but may be considered to be derived from a system of dynamical units in which the unit of length is the earth quadrant or 10 million metres, the unit of mass is 10^{-11} of a gramme and the unit of time is 1 second. The units on this system have received names derived from those of eminent discoverers. Moreover, there is a certain relation between the size of the units for the same quantity on the electrostatic (E.S.) system and that on the electromagnetic (E.M.) system, which depends upon the velocity of light in the medium in which the measurements are supposed to be made. Thus on the E.S. system the unit of electric quantity is a point charge which at a distance of 1 cm. acts on another equal charge with a force of 1 dyne. The E.S. unit of electric current is a current such that 1 E.S. unit of quantity flows per second across each section of the circuit. On the E.M. system we start with the definition that the unit magnetic pole is one which acts on another equal pole at a distance of 1 cm. with a force of 1 dyne. The unit of current on the E.M. system is a current such that if flowing in circular circuit of 1 cm. radius each unit of length of it will act on a unit magnetic pole at the centre with a force of 1 dyne. This E.M. unit of current is much larger than the E.S. unit defined as above. It is v times greater, where $v=3\times10^{10}$ is the velocity of light in air expressed in cms. per second. The reason for this can only be understood by considering the *dimensions* of the quantities with which we are concerned. If L, M, T denote length, mass, time, and we adopt certain sized units of each, then we may measure any derived quantity, such as velocity, acceleration, or force in terms of the derived dynamical units as already explained. Suppose, however, we alter the size of our selected units of L, M or T, we have to consider how this alters the corresponding units of velocity, acceleration, force, &c. To do this we have to consider their dimensions. If the unit of velocity is the unit of length passed over per unit of time, then it is obvious that it varies directly as the unit of length, and inversely as the unit of time. Hence we may say that the dimensions of velocity are L/T or LT^{-1}; similarly the dimensions of acceleration are L/T^2 or LT^{-2}, and the dimensions of a force are MLT^{-2}.

For a fuller explanation see above (UNITS, DIMENSIONS OF), or Everett's *Illustrations of the C.G.S. System of Units.*

Electrostatic and electromagnetic units.

Accordingly on the electrostatic system the unit of electric quantity is such that $f=q^2/Kd^2$, where q is the quantity of the two equal charges, d their distance, f the mechanical force or stress between them, and K the dielectric constant of the dielectric in which they are immersed. Hence since f is of the dimensions MLT^{-2}, q^2 must be of the dimensions of KML^3T^{-2}, and q of the dimensions $M^{\frac{1}{2}}L^{\frac{3}{2}}T^{-1}K^{\frac{1}{2}}$. The dimensions of K, the dielectric constant, are unknown. Hence, in accordance with the suggestion of Sir A. Rücker (*Phil. Mag.*, February 1889), we must treat it as a fundamental quantity. The dimensions of an electric current on the electrostatic system are therefore those of an electric quantity divided by a time, since by current we mean the quantity of electricity conveyed per second. Accordingly current on the E.S. system has the dimensions $M^{\frac{1}{2}}L^{\frac{3}{2}}T^{-2}K^{\frac{1}{2}}$.

We may obtain the dimensions of an electric current on the magnetic system by observing that if two circuits traversed by the same or equal currents are placed at a distance from each other, the mechanical force or stress between two elements of the circuit, in accordance with Ampère's law (see ELECTRO-KINETICS), varies as the square of the current C, the product of the elements of length ds, ds' of the circuits, inversely as the square of their distance d, and directly as the permeability μ of the medium in which they are immersed. Hence $C^2ds\,ds'\mu/d^2$ must be of the dimensions of a force or of the dimensions MLT^{-2}. Now, ds and ds' are lengths, and d is a length, hence the dimensions of electric current on the E.M. system must be $M^{\frac{1}{2}}L^{\frac{1}{2}}T^{-1}\mu^{-\frac{1}{2}}$. Accordingly the dimensions of current on the E.S. system are $M^{\frac{1}{2}}L^{\frac{3}{2}}T^{-2}K^{\frac{1}{2}}$, and on the E.M. system they are $M^{\frac{1}{2}}L^{\frac{1}{2}}T^{-1}\mu^{-\frac{1}{2}}$, where μ and K, the permeability and dielectric constant of the medium, are of unknown dimensions, and therefore treated as fundamental quantities.

The ratio of the dimensions of an electric current on the two systems (E.S. and E.M.) is therefore $LT^{-1}K^{\frac{1}{2}}\mu^{\frac{1}{2}}$. This ratio must be a mere numeric of no dimensions, and therefore the dimensions of $\sqrt{K\mu}$ must be those of the reciprocal of a velocity. We do not know what the dimensions of μ and K are separately, but we do know, therefore, that their product has the dimensions of the reciprocal of the square of a velocity.

Again, we may arrive at two dimensional expressions for electromotive force or difference of potential. Electrostatic difference of potential between two places is measured by the mechanical work required to move a small conductor charged with a unit electric charge from one place to the other against the electric force. Hence if V stands for the difference of potential between the two places, and Q for the charge on the small conductor, the product QV must be of the dimensions of the *work* or *energy*, or of the force$\times$length, or of ML^2T^{-2}. But Q on the electrostatic system of measurement is of the dimensions $M^{\frac{1}{2}}L^{\frac{3}{2}}T^{-1}K^{\frac{1}{2}}$; the potential difference V must be, therefore, of the dimensions $M^{\frac{1}{2}}L^{\frac{1}{2}}T^{-1}K^{-\frac{1}{2}}$. Again, since by Ohm's law and Joule's law electromotive force multiplied by a current is equal to the power expended on a circuit, the dimensions of electromotive force, or, what is the same thing, of potential difference, in the electromagnetic system of measurement must be those of power divided by a current. Since mechanical power means *rate of doing work*, the dimensions of power must be ML^2T^{-3}. We have already seen that on the electromagnetic system the dimensions of a current are $M^{\frac{1}{2}}L^{\frac{1}{2}}T^{-1}\mu^{-\frac{1}{2}}$; therefore the dimensions of electromotive force or potential on the electromagnetic system must be $M^{\frac{1}{2}}L^{\frac{3}{2}}T^{-2}\mu^{\frac{1}{2}}$. Here again we find that the ratio of the dimensions on the electrostatic system to the dimensions on the electromagnetic system is $L^{-1}TK^{-\frac{1}{2}}\mu^{-\frac{1}{2}}$.

In the same manner we may recover from fundamental facts and relations the dimensions of every electric and magnetic quantity on the two systems, starting in one case from electrostatic phenomena and in the other case from electromagnetic or magnetic. The electrostatic dimensional expression will always involve K, and the electromagnetic dimensional expression will always involve μ, and in every case the dimensions in terms of K are to those in terms of μ for the same quantity in the ratio of a power of $LT^{-1}K^{\frac{1}{2}}\mu^{\frac{1}{2}}$. This therefore confirms the view that whatever may be the true dimensions in terms of fundamental units of μ and K, their product is the inverse square of a velocity.

Table I. gives the dimensions of all the principal electric and magnetic quantities on the electrostatic and electromagnetic systems.

It will be seen that in every case the ratio of the dimensions on the two systems is a power of $LT^{-1}K^{\frac{1}{2}}\mu^{\frac{1}{2}}$, or of a velocity multiplied by the square root of the product K and μ; in other words, it is the product of a velocity multiplied by the geometric mean of K and μ. This quantity $1/\sqrt{K\mu}$ must therefore be of the dimensions of a velocity, and the questions arise, What is the absolute value of this velocity? and, How is it to be determined? The answer is, that the value of the velocity in concrete numbers may be obtained by measuring the magnitude of any electric quantity in two ways, one making use only of electrostatic phenomena, and the other only of electromagnetic. To take one instance:—It is easy to show that the electrostatic capacity of a sphere suspended in air or in vacuo at a great distance from other conductors is given by a number equal to its radius in centimetres. Suppose such a sphere to be charged and discharged rapidly with electricity from any source, such as a battery. It would take electricity from the source at a certain rate, and would in fact act like a resistance in permitting the passage through it or by it of a certain quantity of electricity per unit of time. If K is the capacity and n is the number of discharges per second, then nK is a quantity of the dimensions of an electric conductivity, or of the reciprocal of a resistance. If a conductor, of which the electrostatic capacity can be calculated, and which has associated with it a commutator that charges and

Table I.—Dimensions of Electric Quantities

Quantity.	Symbol.	Dimensions on the Electrostatic System E.S.	Dimensions on the Electromagnetic System E.M.	Ratio of E.S to E.M.
Magnetic permeability	(μ)	$L^{-2} T^{2} K^{-1}$	μ	$L^{-2} T^{2} K^{-1} \mu^{-1}$
Magnetic force or field	(H)	$L^{\frac{1}{2}} M^{\frac{1}{2}} T^{-2} K^{\frac{1}{2}}$	$L^{-\frac{1}{2}} M^{\frac{1}{2}} T^{-1} \mu^{-\frac{1}{2}}$	$L\ T^{-1} K^{\frac{1}{2}} \mu^{\frac{1}{2}}$
Magnetic flux density or induction	(B)	$L^{\frac{3}{2}} M^{\frac{1}{2}} K^{-\frac{1}{2}}$	$L^{-\frac{1}{2}} M^{\frac{1}{2}} T^{-1} \mu^{\frac{1}{2}}$	$L^{-1} T\ K^{-\frac{1}{2}} \mu^{-\frac{1}{2}}$
Total magnetic flux	(Z)	$L^{\frac{1}{2}} M^{\frac{1}{2}} K^{-\frac{1}{2}}$	$L^{\frac{3}{2}} M^{\frac{1}{2}} T^{-1} \mu^{\frac{1}{2}}$	$L^{-1} T\ K^{-\frac{1}{2}} \mu^{-\frac{1}{2}}$
Magnetization	(I)	$L^{-\frac{3}{2}} M^{\frac{1}{2}} K^{-\frac{1}{2}}$	$L^{-\frac{1}{2}} M^{\frac{1}{2}} T^{-1} \mu^{\frac{1}{2}}$	$L^{-1} T\ K^{-\frac{1}{2}} \mu^{\frac{1}{2}}$
Magnetic pole strength	(m)	$L^{\frac{1}{2}} M^{\frac{1}{2}} K^{-\frac{1}{2}}$	$L^{\frac{3}{2}} M^{\frac{1}{2}} T^{-1} \mu^{\frac{1}{2}}$	$L^{-1} T\ K^{-\frac{1}{2}} \mu^{-\frac{1}{2}}$
Magnetic moment	(M)	$L^{\frac{3}{2}} M^{\frac{1}{2}} K^{-\frac{1}{2}}$	$L^{\frac{5}{2}} M^{\frac{1}{2}} T^{-1} \mu^{\frac{1}{2}}$	$L^{-1} T\ K^{-\frac{1}{2}} \mu^{-\frac{1}{2}}$
Magnetic potential or magnetomotive force	(M.M.F.)	$L^{\frac{3}{2}} M^{\frac{1}{2}} T^{-2} K^{\frac{1}{2}}$	$L^{\frac{1}{2}} M^{\frac{1}{2}} T^{-1} \mu^{-\frac{1}{2}}$	$L\ T^{-1} K^{\frac{1}{2}} \mu^{\frac{1}{2}}$
Specific inductive capacity	(K)	K	$L^{-2} T^{2} \mu^{-1}$	$L^{2} T^{-2} K \mu$
Electric force	(e)	$L^{-\frac{1}{2}} M^{\frac{1}{2}} T^{-1} K^{-\frac{1}{2}}$	$L^{\frac{1}{2}} M^{\frac{1}{2}} T^{-2} \mu^{\frac{1}{2}}$	$L^{-1} T\ K^{-\frac{1}{2}} \mu^{-\frac{1}{2}}$
Electric displacement	(D)	$L^{-\frac{1}{2}} M^{\frac{1}{2}} T^{-1} K^{\frac{1}{2}}$	$L^{-\frac{3}{2}} M^{\frac{1}{2}} \mu^{-\frac{1}{2}}$	$L\ T^{-1} K^{\frac{1}{2}} \mu^{\frac{1}{2}}$
Electric quantity	(Q)	$L^{\frac{3}{2}} M^{\frac{1}{2}} T^{-1} K^{\frac{1}{2}}$	$L^{\frac{1}{2}} M^{\frac{1}{2}} \mu^{-\frac{1}{2}}$	$L\ T^{-1} K^{\frac{1}{2}} \mu^{\frac{1}{2}}$
Electric current	(A)	$L^{\frac{3}{2}} M^{\frac{1}{2}} T^{-2} K^{\frac{1}{2}}$	$L^{\frac{1}{2}} M^{\frac{1}{2}} T^{-1} \mu^{-\frac{1}{2}}$	$L\ T^{-1} K^{\frac{1}{2}} \mu^{\frac{1}{2}}$
Electric potential / Electromotive force	(V) / (E.M.F.)	$L^{\frac{1}{2}} M^{\frac{1}{2}} T^{-1} K^{-\frac{1}{2}}$	$L^{\frac{3}{2}} M^{\frac{1}{2}} T^{-2} \mu^{\frac{1}{2}}$	$L^{-1} T\ K^{-\frac{1}{2}} \mu^{-\frac{1}{2}}$
Electric resistance	(R)	$L^{-1} T\ K^{-1}$	$L\ T^{-1} \mu$	$L^{-2} T^{2} K^{-1} \mu^{-1}$
Electric capacity	(C)	$L\ K$	$L^{-1} T^{2} \mu^{-1}$	$L^{2} T^{-2} K \mu$
Self inductance / Mutual inductance	(L) / (M)	$L^{-1} T^{2} K^{-1}$	$L\ \mu$	$L^{-2} T^{2} K^{-1} \mu^{-1}$

discharges it n times per second, is arranged in one branch of a Wheatstone's Bridge, it can be treated and measured as if it were a resistance, and its equivalent resistance calculated in terms of the resistance of all the other branches of the bridge (see *Phil. Mag.*, 1885, 20, 258).

Accordingly, we have two methods of measuring the capacity of a conductor. One, the electrostatic method, depends only on the measurement of a length, which in the case of a sphere in free space is its radius; the other, the electromagnetic method, determines the capacity in terms of the quotient of a time by a resistance. The ratio of the electrostatic to the electromagnetic value of the same capacity is therefore of the dimensions of a velocity multiplied by a resistance in electromagnetic value, or of the dimensions of a velocity squared. This particular experimental measurement has been carried out carefully by many observers, and the result has been always to show that the velocity v which expresses the ratio is very nearly equal to 30 thousand million centimetres per second; v=nearly 3×10^{10}. The value of this important constant can be determined by experiments made to measure electric quantity, potential, resistance or capacity, both in electrostatic and in electromagnetic measure. For details of the various methods employed, the reader must be referred to standard treatises on Electricity and Magnetism, where full particulars will be found (see Maxwell, *Treatise on Electricity and Magnetism*, vol. ii. ch. xix. 2nd ed.; also Mascart and Joubert, *Treatise on Electricity and Magnetism*, vol. ii. ch. viii., Eng. trans. by Atkinson).

Table II. gives a list of some of these determinations of v, with references to the original papers.

It will be seen that all the most recent values, especially those in which a comparison of capacity has been made, approximate to 3×10^{10} centimetres per second, a value which is closely in accord with the latest and best determinations of the velocity of light.

Practical units. We have in the next place to consider the question of practical electric units and the determination and construction of concrete standards. The committee of the British Association charged with the duty of arranging a system of absolute and magnetic units settled also on a system of practical units of convenient magnitude, and gave names to them as follows:—

10^9 absolute electromagnetic units of resistance			= 1 ohm
10^8	,,	,, units of electromotive force	= 1 volt
$\frac{1}{10}$th of an ,,	,,	unit of current	= 1 ampere
$\frac{1}{10}$th of an ,,	,,	unit of quantity	= 1 coulomb
10^{-9}	,,	,, units of capacity	= 1 farad
10^{-15}	,,	,, units of capacity	= 1 microfarad

Since the date when the preceding terms were adopted, other multiples of absolute C.G.S. units have received practical names, thus:—

10^7 ergs or absolute C.G.S. units of energy	= 1 joule
10^7 ergs per second or C.G.S. units of power	= 1 watt
10^9 absolute units of inductance	= 1 henry
10^8 absolute units of magnetic flux	= 1 weber[1]
1 absolute unit of magnetomotive force	= 1 gauss[1]

An Electrical Congress was held in Chicago, U.S.A., in August 1893, to consider the subject of international practical electrical units, and the result of a conference between scientific representatives of Great Britain, the United States, France, Germany, Italy, Mexico, Austria, Switzerland, Sweden and British North America, after deliberation for six days, was a unanimous agreement to recommend the following resolutions as the definition of practical international units. These resolutions and definitions were confirmed at other conferences, and at the last one held in London in October 1908 were finally adopted. It was agreed to take:—

"As a unit of resistance, the *International Ohm*, which is based upon the ohm equal to 10^9 units of resistance of the C.G.S. system of electromagnetic units, and is represented by the resistance offered to an unvarying electric current by a column of mercury at the temperature of melting ice 14·4521 grammes in mass, of a constant cross-sectional area and of the length of 106·3 cm.

"As a unit of current, the *International Ampere*, which is one-tenth of the unit of current of the C.G.S. system of electromagnetic units, and which is represented sufficiently well for practical use by the unvarying current which, when passed through a solution of nitrate of silver in water, deposits silver at the rate of 0·00111800 of a gramme per second.

"As a unit of electromotive force, the *International Volt*, which is the electromotive force that, steadily applied to a conductor whose resistance is one international ohm, will produce a current of one international ampere. It is represented sufficiently well for practical purposes by $\frac{10000}{10184}$ of the E.M.F. of a normal or saturated cadmium Weston cell at 20° C., prepared in the manner described in a certain specification.

"As a unit of quantity, the *International Coulomb*, which is the quantity of electricity transferred by a current of one international ampere in one second.

"As the unit of capacity, the *International Farad*, which is the capacity of a condenser charged to a potential of one international volt by one international coulomb of electricity.

"As a unit of work, the *Joule*, which is equal to 10^7 units of work in the C.G.S. System, and which is represented sufficiently well for practical use by the energy expended in one second by an international ampere in an international ohm.

"As a unit of power, the *Watt*, which is equal to 10^7 units of power in the C.G.S. System, and which is represented sufficiently well for practical use by the work done at the rate of one joule per second.

"As the unit of inductance, the *Henry*, which is the induction in a circuit when an electromotive force induced in this circuit is one international volt, while the inducing current varies at the rate of one ampere per second."

[1] Neither the weber nor the gauss has received very general adoption, although recommended by the Committee of the British Association on Electrical Units. Many different suggestions have been made as to the meaning to be applied to the word "gauss." The practical electrical engineer, up to the present, prefers to use *one ampere-turn* as his unit of magnetomotive force, and *one line of force* as the unit of magnetic flux, equal respectively to $10/4\pi$ times and 1 times the C.G.S. absolute units. Very frequently the "kiloline," equal to 1000 lines of force, is now used as a unit of magnetic flux.

TABLE II.—OBSERVED VALUES OF v IN CENTIMETRES PER SECOND

Date.	Name.	Reference.	Electric Quantity Measured.	v in Centimetres per Second.
1856	W. Weber and R. Kohlrausch	*Electrodynamische Massbestimmungen* and *Pogg. Ann.* xcix., August 10, 1856	Quantity	$3{\cdot}107\times10^{10}$
1867 1868	Lord Kelvin and W. F. King	*Report of British Assoc.*, 1869, p. 434; and *Reports on Electrical Standards*, F. Jenkin, p. 186	Potential	$2{\cdot}81\times10^{10}$
1868	J. Clerk Maxwell .	*Phil. Trans. Roy. Soc.*, 1868, p. 643	„	$2{\cdot}84\times10^{10}$

1889	E. B. Rosa . .	*Phil. Mag.*, 1889	Capacity	$3{\cdot}000\times10^{10}$
1890	Sir J. J. Thomson and G. F. C. Searle	*Phil. Trans.*, 1890	„	$2{\cdot}995\times10^{10}$
1897	M. E. Maltby. .	*Wied. Ann.* 1897	Alternating currents	$3{\cdot}015\times10^{10}$

In connexion with the numerical values in the above definitions much work has been done. The electrochemical equivalent of silver or the weight in grammes deposited per second by 1 C.G.S. electromagnetic unit of current has been the subject of much research. The following determinations of it have been given by various observers:—

Name.	Value.	Reference.
E. E. N. Mascart . .	0·011156	*Journ. de physique*, 1884, (2), 3, 283.
F. and W. Kohlrausch .	0·011183	*Wied. Ann.*, 1886, 27, 1.
Lord Rayleigh and Mrs Sedgwick	0·011179	*Phil. Trans. Roy. Soc.*, 1884, 2, 411.
J. S. H. Pellat and A. Potier	0·011192	*Journ. de Phys.*, 1890, (2), 9, 381.
Karl Kahle . . .	0·011183	*Wied. Ann.*, 1899, 67, 1.
G. W. Patterson and K. E. Guthe	0·011192	*Physical Review*, 1898, 7, 251.
J. S. H. Pellat and S. A. Leduc	0·011195	*Comptes rendus*, 1903, 136, 1649.

Although some observers have urged that the 0·01119 is nearer to the true value than 0·01118, the preponderance of the evidence seems in favour of this latter number and hence the value per ampere-second is taken as 0·0011800 gramme. The exact value of the electromotive force of a Clark cell has also been the subject of much research. Two forms of cell are in use, the simple tubular form and the H-form introduced by Lord Rayleigh. The Berlin Reichsanstalt has issued a specification for a particular H-form of Clark cell, and its E.M.F. at 15° C. is taken as 1·4328 international volts. The E.M.F. of the cell set up in accordance with the British Board of Trade specification is taken as 1·434 international volts at 15° C. The detailed specifications are given in Fleming's *Handbook for the Electrical Laboratory and Testing Room* (1901), vol. i. chap. 1; in the same book will be found copious references to the scientific literature of the Clark cell. One objection to the Clark cell as a concrete standard of electromotive force is its variation with temperature and with slight impurities in the mercurous sulphate used in its construction. The Clark cell is a voltaic cell made with mercury, mercurous sulphate, zinc sulphate, and zinc as elements, and its E.M.F. decreases 0·08% per degree Centigrade with rise of temperature. In 1891 Mr Weston proposed to employ cadmium and cadmium sulphate in place of zinc and zinc sulphate and found that the temperature coefficient for the cadmium cell might be made as low as 0·004 % per degree Centigrade. Its E.M.F. is, however, 1·0184 international volts at 20° C. For details of construction and the literature of the subject see Fleming's *Handbook for the Electrical Laboratory*, vol. i. chap. 1.

In the British Board of Trade laboratory the ampere and the volt are not recovered by immediate reference to the electrochemical equivalent of silver or the Clark cell, but by means of instruments called a standard ampere balance and a standard 100-volt electrostatic voltmeter. In the standard ampere balance the current is determined by weighing the attraction between two coils traversed by the current, and the ampere is defined to be the current which causes a certain attraction between the coils of this standard form of ampere balance. The form of ampere balance in use at the British Board of Trade electrical standards office is described in Fleming's *Handbook for the Electrical Laboratory*, vol. i., and that constructed for the British National Physical Laboratory in the report of the Committee on Electrical Standards (*Brit. Assoc. Rep.*, 1905). This latter instrument will recover the ampere within one-thousandth part. For a further description of it and for full discussion of the present position of knowledge respecting the values of the international practical units the reader is referred to a paper by Dr F. A. Wolff read before the International Electrical Congress at St Louis Exhibition, U.S.A., in 1904, and the subsequent discussion (see *Journ. Inst. Elec. Eng. Lond.*, 1904–5, 34, 190, and 35, 3).

The construction of the international ohm or practical unit of resistance involves a knowledge of the specific resistance of mercury. Numerous determinations of this constant have been made. The results are expressed either in terms of the length in cm. of the column of pure mercury of 1 sq. mm. in section which at 0° C. has a resistance of 10^9 C.G.S. electromagnetic units, or else in terms of the weight of mercury in grammes for a column of constant cross-sectional area and length of 100·3 cm. The latter method was adopted at the British Association Meeting at Edinburgh in 1892, but there is some uncertainty as to the value of the density of mercury at 0° C. which was then adopted. Hence it was proposed by Professor J. Viriamu Jones that the redetermination of the ohm should be made when required by means of the Lorentz method (see J. V. Jones, "The Absolute Measurement of Electrical Resistance," *Proc. Roy. Inst.* vol. 14, part iii. p. 601). For the length of the mercury column defining the ohm as above, Lord Rayleigh in 1882 found the value 106·27 cm., and R. T. Glazebrook in the same year the value 106·28 cm. by a different method, while another determination by Lord Rayleigh and Mrs Sedgwick in 1883 gave 106·22 cm. Viriamu Jones in 1891 gave the value 106·30 cm., and one by W. E. Ayrton in 1897 by the same method obtained the value 106·27 to 106·28 cm. Hence the specific resistance of mercury cannot be said to be known to 1 part in 10,000, and the absolute value of the ohm in centimetres per second is uncertain to at least that amount. (See also J. Viriamu Jones, "On a Determination of the International Ohm in Absolute Measure," *Brit. Assoc. Report*, 1894.)

Rational system of electrical units.

The above-described practical system based on the C.G.S. double system of theoretical units labours under several very great disadvantages. The practical system is derived from and connected with an abnormally large unit of length (the earth quadrant) and an absurdly small unit of mass. Also in consequence of the manner in which the unit electric quantity and magnetic pole strength are defined, a coefficient, 4π, makes its appearance in many practical equations. For example, on the present system the magnetic force H in the interior of a long spiral wire of N turns per centimetre of length when a current of A amperes circulates in the wire is 4πAN/10. Again, the electric displacement or induction D through a unit of area is connected with the electric force E and the dielectric constant K by the equation $D=KE/4\pi$. In numerous electric and magnetic equations the constant 4π makes its appearance where it is apparently meaningless. A system of units in which this constant is put into its right place by appropriate definitions is called a rational system of electric units. Several physicists have proposed such systems. Amongst others that of Professor G. Giorgi especially deserves mention.

Giorgi's system of electrical units.

We have seen that in expressing the dimensions of electric and magnetic qualities we cannot do so simply by reference to the units of length, mass and time, but must introduce a fourth fundamental quantity. This we may take to be the dielectric constant of the ether or its magnetic permeability, and thus we obtain two systems of measurement. Professor Giorgi proposes that the four fundamental quantities shall be the units of length, mass, time and electrical resistance, and takes as the concrete units or standards the metre, kilogramme, second and ohm. Now this proposal not only has the advantage that the theoretical units are identical with the actual practical concrete units, but it is also a rational system. Moreover, the present practical units are unaltered; the ampere, volt, coulomb, weber, joule and watt remain the actual as well as theoretical units of current, electromotive force, quantity, magnetic flux, work and power. But the unit of magnetic force becomes the ampere-turn per metre, and the unit of electric force the volt per metre; thus the magnetic units are measured in terms of electric units. The numerical value of the permeability of ether or air becomes $4\pi \times 10^{-7}$ and the dielectric constant of the ether or air becomes $1/4\pi \times 9 \times 10^{9}$; their product is therefore $1/(3\times 10^{8})^{2}$, which is the reciprocal of the square of the velocity of light in metres per second.

For a discussion of the Giorgi proposals, see a paper by Professor M. Ascoli, read before the International Electrical Congress at St Louis, 1904 (*Journ. Inst. Elect. Eng. Lond.*, 1904, 34, 176).

It can hardly be said that the present system of electrical units is entirely satisfactory in all respects. Great difficulty would of course be experienced in again altering the accepted practical concrete units, but if at any future time a reformation should be possible, it would be desirable to bear in mind the recommendations made by Oliver Heaviside with regard to their rationalization. The British Association Committee defined the strength of a magnetic pole by reference to the mechanical stress between it and another equal pole: hence the British Association unit magnetic pole is a pole which at a distance of one centimetre attracts or repels another equal pole with a force of one dyne. This, we have seen, is an imperfect definition, because it omits all reference to the permeability of the medium in which the experiment takes place; but it is also unsatisfactory as a starting-point for a system of units for another reason. The important quantity in connexion with polar magnets is not a mechanical stress between the free poles of different magnets, but the magnetic flux emanating from, or associating with, them. From a technical point of view this latter quality is far more important than the mechanical stress between the magnetic poles, because we mostly employ magnets to create induced electromotive force, and the quantity we are then mostly concerned with is the magnetic flux proceeding from the poles. Hence the most natural definition of a unit magnet pole is that pole from which proceeds a total magnetic flux of one unit. The definition of one unit of magnetic flux must then be that flux which, when inserted into or withdrawn from a conducting circuit of one turn having unit area and unit conductivity, creates in it a flow or circulation of one unit of electric quantity. The definition of a unit magnetic pole ought, therefore, to have been approached from the definition of a unit of electric quantity.

On the C.G.S. or British Association system, if a magnetic filament has a pole strength m—that is to say, if it has a magnetization I, and a section s, such that Is equals m—then it can be shown that the total flux emanating from the pole is $4\pi m$. The factor 4π, in consequence of this definition, makes its appearance in many practically important expressions. For instance, in the well-known magnetic equation connecting the vector values of magnetization I, magnetic force H and magnetic flux density B, where we have the equation

$$B = H + 4\pi I,$$

the appearance of the quantity 4π disguises the real physical meaning of the equation.

The true remedy for this difficulty has been suggested by Heaviside to be the substitution of *rational* for *irrational* formulae and definitions.

Heaviside's rational system.

He proposes to restate the definition of a unit magnetic pole in such a manner as to remove this constant 4π from the most frequently employed equations. His starting-point is a new definition according to which a unit magnetic pole is said to have a strength of m units if it attracts or repels another equal pole placed at a distance of d centimetres with a force of $m^2/4\pi d^2$ dynes. It follows from this definition that a rational unit magnetic pole is weaker or smaller than the irrational or British Association unit pole in the ratio of $1/\sqrt{4\pi}$ to 1, or ·28205 to 1. The magnetic force due to a rational pole of strength m at a distance of d centimetres being $m/4\pi d^2$ units, if we suppose a magnetic filament having a pole of strength m in rational units to have a smaller sphere of radius r described round its pole, the magnetic force on the surface of this sphere is $m/4\pi r^2$ units, and this is therefore also the numerical value of the flux density. Hence the total magnetic flux through the surface of the sphere is

$$4\pi r^2 \times m/4\pi r^2 \text{ units} = m \text{ units};$$

and therefore the number which denotes the total magnetic flux coming out of the pole of strength m in rational units is also m.

The Heaviside system thus gives us an obvious and natural definition of a unit magnetic pole, namely, that it is a pole through which proceeds the unit of magnetic flux. It follows, therefore, that if the intensity of magnetization of the magnetic filament is I and the section is s, the total flux traversing the centre of the magnet is Is units; and that if the filament is an endless or poleless iron filament magnetized uniformly by a resultant external magnetic force H, the flux density will be expressed in rational units by the equation $B = I + H$. The physical meaning of this equation is that the flux per square centimetre in the iron is simply obtained by adding together the flux per square centimetre, if the iron is supposed to be removed, and the magnetization of the iron at that place. On the rational system, since the unit pole strength has been decreased in the ratio of I to $1/\sqrt{4\pi}$, or of 3·5441 to 1, when compared with the magnitude of the present irrational unit pole, and since the unit of magnetic flux is the total flux proceeding from a magnetic pole, it follows that Heaviside's unit of magnetic flux is larger than the C.G.S. unit of magnetic flux in the ratio of 3·5441 to 1.

It will be seen, therefore, that the Heaviside rational units are all incommeasurable with the practical units. This is a great barrier to their adoption in practice, because it is impossible to discard all the existing resistance coils, ammeters, voltmeters, &c., and equally impossible to recalibrate or readjust them to read in Heaviside units. A suggestion has been made, in modification of the Heaviside system, which would provide a system of rational practical units not impossible of adoption. It has been pointed out by J. A. Fleming that if in place of the ampere, ohm, watt, joule, farad and coulomb, we employ the dekampere, dekohm, the dekawatt, the dekajoule, the dekafarad and the dekacoulomb, we have a system of practical units such that measurements made in these units are equal to measurements made in Heaviside rational units when multiplied by some power of 4π. Moreover, he has shown that this power of 4π, in the case of most units, varies inversely as the power under which μ appears in the complete dimensional expression for the quantity in electromagnetic measurement. Thus a current measured in Heaviside rational units is numerically equal to $(4\pi)^{\frac{1}{2}}$ times the same current measured in dekamperes, and in the electromagnetic dimensional expression for current, namely, $L^{\frac{1}{2}}M^{\frac{1}{2}}T^{-1}\mu^{-\frac{1}{2}}$, μ appears as $\mu^{-\frac{1}{2}}$. If, then, we consider the permeability of the ether to be numerically 4π instead of unity, the measurement of a current in dekamperes will be a number which is the same as that given by reckoning in Heaviside rational units. In this way a system of *Rational Practical Units* (R.P. Units) might be constructed as follows:—

The R.P. Unit of	Magnetic Force	= 4π	×	the C.G.S. Unit.	
,,	,,	Magnetic Polarity = $1/4\pi$	×	,,	,,
,,	,,	Magnetic Flux	=	1	,,
,,	,,	Magnetomotive Force	=	1	,,
,,	,,	Electric Current	=	1	,,
,,	,,	Electric Quantity	=	1	,,
,,	,,	Electromotive Force	=	10^8	,,
,,	,,	Resistance	=	10^8	,,
,,	,,	Inductance	=	10^8	,,
,,	,,	Power	=	10^8	,,
,,	,,	Work	=	10^8	,,
,,	,,	Capacity	=	10^{-8}	,,

All except the unit of magnetic force and magnetic polarity are commensurable with the corresponding C.G.S. units, and in multiples which form a convenient practical system.

Even the rational systems already mentioned do not entirely fulfil the ideal of a system of physical units. There are certain constants of nature which are fundamental, invariable, and, as far as we know, of the same magnitude in all parts of the universe. One of these is the *mass* of the atom, say of hydrogen. Another is the *length* of a wave of light of particular refrangibility emitted by some atom, say one of the two yellow lines in the spectrum of sodium or one of the hydrogen lines. Also a *time* is fixed by the velocity of light in space which is according to the best measurement very close to 3×10^{10} cms. per sec. Another natural unit is the so-called *constant of gravitation*, or the force in dynes due to the attraction of two spherical masses each of 1 gramme with centres at a distance of 1 cm. Very approximately this is equal to 648×10^{-10} dynes. Another natural electrical unit of great importance is the electric charge represented by 1 electron (see ELECTRICITY). This according to the latest determination is nearly $3\cdot4\times10^{-10}$ electrostatic units of quantity on the C.G.S. system. Hence, 2930 million electrons are equal to 1 E.S. unit of quantity on the C.G.S. system, and the quantity called 1 coulomb is equal to 879×10^{16} electrons. In round numbers 9×10^{18} electrons make 1 coulomb. The electron is nature's unit of electricity and is the charge carried by 1 hydrogen ion in electrolysis (see CONDUCTION, ELECTRIC, § *Liquids*). Accordingly a truly natural system of physical units would be one which was based upon the electron, or a multiple of it, as a unit of electric quantity, the velocity of light or fraction of it as a unit of velocity, and the mass of an atom of hydrogen or multiple of it as a unit of mass. An approximation to such a natural system of electric units will be found discussed in chap. 17 of a book on *The Electron Theory*, by E.E. Fournier d'Albe (London, 1906), to which the reader is referred.

UNIVERSALIST CHURCH, a religious body organized in the United States, and represented chiefly by parishes and churches in that country and in Canada. While the distribution of the denomination extends to every state in the Union, the greater number of organizations and members are found in New England and New York.

A distinction should be noted between Universalism and the Universalist denomination. Universalism is found very early in the history of the Christian Church—apparently from the beginning. It was certainly held and taught by several of the greatest of the Apostolic and Church fathers: as Clement of Alexandria, Gregory of Nyssa, Origen and probably by Chrysostom and Jerome. It was taught in a majority of the Christian Schools of the second and third centuries; at Alexandria, at Antioch, at Edessa and at Nisibis.[1] But the Universalist denomination is of modern origin and confined mostly to the American continent. It dates from the arrival in Good Luck, N.J., of the Rev. John Murray (1714–1815),[2] of London, in September 1770; although there were some preachers of the doctrine in the country before Mr Murray came. He preached in various places in New Jersey, New York, Pennsylvania and Massachusetts, and societies sprang up as the result of his ministry in all these states. His first regular settlement was in Gloucester, Mass., in 1774, whence in 1793 he removed to Boston, which from that time forth became the headquarters of the denomination. A contemporary of Murray in his later years was Hosea Ballou (*q.v.*), also of Boston, who soon became the recognized leader of the movement, and for half a century was its most honoured and influential name. During his ministry the sect developed from twenty or thirty churches to five hundred, with a distribution over the Eastern and Middle states. In the period of Mr Ballou's domination little attention was paid to organization. It was the period of the propagation of the doctrine and of the controversies to which that gave rise. But about 1860 began an agitation for a more coherent organization, and a polity better suited to unity and progress than the spontaneous congregationalism that had developed during the earlier period. The result of that agitation was the adoption, at the Centennial Convention in 1870, of a somewhat elaborate plan of organization, and a manual of administration under which the denomination has since been conducted.

The plan of organization of the Universalist body follows, with necessary modifications, the scheme of the civil organization of the national government. While the local parish is the unit, the states are organized as independent federations, and combined into a national congress or convention. The parishes within the territory of a state are organized into a state convention; representatives, duly elected by the several state conventions, constitute the General Convention, which is the supreme legislative authority of the denomination. The state conventions meet annually; the General Convention once in two years. In the interval of sessions a Board of Trustees, consisting of eleven members, of whom the secretary, the chief administrative officer of the Convention, is one, administer the affairs of the denomination, except those concerns "reserved to the states and the people."

Doctrine.—The historic symbol of the denomination remains the Winchester Profession, adopted at the meeting of the General Convention—then a spontaneous yearly gathering of Universalists, without ecclesiastical authority—in Winchester, N.H., in Sept. 1803. It consists of three brief articles, as follows:—

Article I.—We believe that the Holy Scriptures of the Old and New Testaments contain a revelation of the character of God and of the duty, interest and final destination of mankind.

Article II.—We believe that there is one God, whose nature is Love, revealed in one Lord Jesus Christ, by one Holy Spirit of Grace, who will finally restore the whole family of mankind to holiness and happiness.

Article III.—We believe that holiness and true happiness are inseparably connected, and that believers ought to be careful to maintain order and practise good works; for these things are good and profitable unto men.[3]

At the session of the General Convention in Boston in October 1900, a still briefer "Statement of Essential Principles" was adopted and made the condition of fellowship, in the following terms:—

1. The Universal Fatherhood of God; 2. the Spiritual authority and leadership of His Son, Jesus Christ; 3. the trustworthiness of the Bible as containing a revelation from God; 4. the certainty of just retribution for sin; 5. the final harmony of all souls with God.

Universalism, shortly described, is the belief that what ought to be will be. In a sane and beneficent universe the primacy belongs to Truth, Right, Love. These are the supreme powers. The logic of this conception of the natural and moral order is imperious. It compels the conclusion that, although we see not yet all things put under the sway of the Prince of Peace, we see the Divine plan set forth in Him, and cannot doubt the consummation which He embodies and predicts. Universalists are those members of the Christian family in whom this thought has become predominant. The idea that there is a Divine order, and that it contemplates the final triumph of Good over Evil, in human society as a whole and in the history of each individual, has taken possession of them. Hence they are Universalists.

[1] See Dr Edward Beecher's *History of Opinions on the Scriptural Doctrine of Retribution* (New York, 1878), and Hosea Ballou 2nd's *Ancient History of Universalism* (Boston, 1829).

[2] A Wesleyan, then a follower of Whitefield, Murray became a Universalist after reading the tract on *Union* (1759) written by James Relly (1720–1778), minister of a Universalist congregation in London. Murray was a chaplain in a Rhode Island brigade during the War of American Independence, and a friend of General Nathanael Greene. His Universalism was Calvinistic in its tone, arguing from a universal election to a universal redemption—Ballou first openly broke with Calvinism. Murray's parish in Gloucester through him brought successful suit for the recovery of property appropriated for the use of the original (Congregational) parish, and thus gained the first legal recognition granted in New England to a Universalist society. See the *Autobiography* (Boston, 1816) edited by his wife, Judith Sargent Murray (1751–1820).

[3] Certain Universalists objected to the last clause of Article II. as implying a universal fall in Adam's sin; and others objected to the material and utilitarian construction which might be put on the last clause of Article III.

The Universalist Church embraces but a fraction of those who hold the Universalist belief. The literature of religion, the testimony of common knowledge, the drift of theological thinking, equally with the results of expert investigation, confirm this conclusion. But the denomination holds aloft the banner, conducts the campaign of education and organization, and represents in the religious world the principle, that the best possible outcome is to be expected to the human experiment.

Work.—Some idea of the work carried on by the denomination may be derived from the extent and variety of its organized forces. There were in 1907 about 1000 parishes on its roll; and these, with large numbers of families not included in parishes, were organized into 41 state and provincial conventions; into a National Young People's Christian Union of over 600 local societies, with a membership of 10,000; into one National Women's Missionary Association and several state societies; and into one General Convention, with its Board of Trustees, Secretary, Superintendent, and Committees on Missions, Education, Investments, Ways and Means and Fellowship.

a. The Home Missionary work devolves in the first instance on the several State Conventions, which have a Board and local secretaries and superintendents charged with this particular business in their several territories. In the next place, the Home Missionary work in new fields and where the local organization is weak, is in charge of the Board of Trustees of the General Convention. They employ a Southern Missionary and a General Superintendent, and appoint and aid in maintaining superintendents and missionaries in the newer states and Territories—as the North-Western Superintendent, the California Superintendent, &c.

b. Foreign Missions. In 1907 the Universalist denomination had for about fifteen years maintained a mission in Japan, where five American and five native missionaries were regularly employed, with teachers and helpers of varying numbers. The parent church of this mission is established in Tokyo, and plantings have been made at eight or nine other points throughout the empire. A Girls' Home is maintained in Tokyo, and a considerable work in teaching and training is conducted under the auspices of the Mission in universities and other schools elsewhere. A mission under the auspices of the Universalist General Convention is also maintained at Columbia, Province of Camagüey, Cuba.

c. The educational interests and activities of the denomination are expressed in four colleges, established by the Universalists—Tufts College (1852), at Medford, Massachusetts; Lombard College (1855; opened in 1852 as Illinois Liberal Institute), at Galesburg, Illinois; St Lawrence University (1856), at Canton, New York; and Buchtel College (1872), at Akron, Ohio; three theological schools, connected with the first three colleges just named and founded respectively in 1869, 1881 and 1858; and three academies, Dean Academy, Franklin, Massachusetts, Goddard Seminary, Barre, Vermont, and Westbrook Seminary, Portland, Maine; and a publishing house in Boston with a branch in Chicago is one of the denomination's chief agencies for the spread of the knowledge of what it holds to be the truth.

d. The Chapin Home in New York, the Church of the Messiah Home in Philadelphia, the Washburne Home in Minneapolis and the Bethany Home in Boston are examples of the benevolent and charitable work in which the Universalist body is interested and enlisted.

As stated above, the Universalist denomination embraces about 1000 churches, with congregations numbering about 200,000 persons; a membership of communicants reported in 1906 as 55,831; a membership in Sunday schools of 52,538; and church property valued at $10,598,100·39.

UNIVERSAL LANGUAGES. The inconveniences resulting from the diversity of languages have been felt since the dawn of civilization. Even the most gifted linguist cannot master more than a comparatively small number of languages, and has to rely more or less on interpreters in his intercourse with speakers of foreign languages.

Advancing civilization brought with it a partial remedy at different periods and in different parts of the world by the spread of such languages as Assyrian, Greek, Latin, Arabic, English over a wide area as the accompaniment of political supremacy, or as a vehicle of culture. Even when Latin split up into the Romance languages, and ceased to be a living language itself, it still survived as the common learned language of Europe both in speech and writing (see Latin Language and Classics), till the rapid development of modern science and modern thought and the rapidly increasing complexity of modern life outstripped the limited range of a language never suited for international use.

Meanwhile the growth of the spirit of nationality has largely increased the number of literary languages. Russian men of science are no longer content to record their discoveries in French or German. The English student of science or philosophy has to leave unread many important works written in the more remote European languages, or make their acquaintance through an often inaccurate translation—perhaps in a language of which he is only imperfectly master.

The question of the adoption of a common language becomes, therefore, more and more pressing.

The most obvious solution of the problem would be the adoption of some one existing language as a means of international communication. But which? To revive the international use of Latin is out of the question. If it is to be a dead language, post-classical Greek would afford a more flexible—and perhaps an easier—means of expression. If we dismiss dead languages as impracticable, the choice of a living language raises new difficulties. To exalt English, or French, or Spanish to the rank of a world-language would give its native speakers such an advantage over the other nationalities that it has been seriously proposed to disarm international jealously by selecting such a language as Norwegian, which is spoken by a small community and is at the same time comparatively simple in structure.

But even if agreement were possible, we are still met by the difficulty that to the average human being it is practically impossible to acquire anything like an easy, thorough command of any foreign language. No natural language is really easy. In fact, we may go further and say that all languages are equally difficult (see H. Sweet, *Practical Study of Languages*, p. 66); although some are made more difficult than they need be by the way in which they are written—by the crabbedness of their alphabet, or by their unphonetic spelling—by the want of handbooks or their unpractical character, by the artificiality of their literature, and other purely external causes. Norwegian is easy to a Swede because it is practically a mere dialect of his own language: he knows two-thirds of it already. But that does not prove that Norwegian is easy in itself—that it would be easy, for instance, to an Oriental. The dialects of Chinese are mutually unintelligible, but it takes a Chinaman only about six months to learn another dialect, which would occupy even a gifted European at least three years to learn to speak; and yet Chinese is, from a European point of view, far simpler in structure than Norwegian, or even English.

Natural languages are difficult because they are imperfect expressions of thought: because language is only partly rational. The greatest difficulty of a language is the vocabulary; and the foundation of the vocabulary of all languages is practically arbitrary: there is no connexion between sound and meaning except in a few isolated words. And even that part of a language which can be brought more or less under general rules is full of irregularities and exceptions, ambiguities and redundancies of expression, and superfluous or irrational distinctions such as those of grammatical gender, so that when we have learnt one sentence we can never be sure that it will serve as a pattern for another.

These considerations suggest a further step towards the attainment of a common language: to rationalize and make regular some existing language. Even if we agreed to adopt an existing language unaltered in itself, we should certainly get rid of its external difficulties: neither English nor French could become world-languages till they had got rid of their unphonetic spelling. But from this it would be a natural step to eliminate such grammatical difficulties as those of *shall* and *will* in English. If this were once agreed on, why not go a step further and get rid of all grammatical irregularities, making, for instance, *better men* into *gooder mans*, *saw*, *seen* into *seed*, and so on? The vocabulary would offer little obstacle to a parallel simplification. The self-evident method would be to select certain words as the foundation: to use them as root-words from which all the other words could be formed by derivation and composition. The inconvenient length of many of the words so formed would then suggest reducing the root-words to a monosyllabic form, with such modifications as would be required to prevent confusions of form or meaning, or to make their pronunciation easier.

It is on these principles that the well-known Volapük (*q.v.*) is constructed (1880)—the first artificial language that achieved a certain measure of success. But its roots are so disguised by arbitrary alterations that the English basis is not generally easy to recognize.

Volapük is mainly an adapted (borrowed) or a-posteriori language, as opposed to an original or a-priori one, although it belongs partly to the latter class as well. Its vocabulary is adapted, but its grammar is, to a great extent, original.

On the ruins of Volapük there rose Esperanto (*q.v.*), which by 1907 had become the most widely known and used of its numerous competitors. In its grammar Esperanto is partly original, partly borrowed. Its vocabulary is not based exclusively on that of any one language, but is selected from the chief European languages—including Latin and Greek—the words being generally unaltered except in spelling. The extensive use made of word-composition and of derivative prefixes and suffixes enables the author to reduce the number of his root-words to between two and three thousand. This does not include international literary, scientific and technical words such as *professor*, *telegraph*, which are not translated into Esperanto compounds or derivatives, but are simply incorporated into the language with the minimum of change.

The most formidable rival of Esperanto is unquestionably Idiom Neutral (1902). It is the collective work of the *Akademi internasional de lingu universal*, its real author being the director of the *Akademi*, M. Rosenberger, of St Petersburg. This academy was originally instituted by the two international Volapük congresses in 1887 and 1889: it now numbers among its members not only many former adherents of the defunct Volapük, but also many ex-Esperantists. The most marked feature of Idiom Neutral is that its vocabulary is definitely and consistently based on the principle of the maximum of internationality for the roots. A systematic examination of the vocabularies of the seven chief European languages—English, French, German, Spanish, Italian, Russian, Latin—showed that the number of international roots and words was much greater than had been supposed. There are many, such as *apetit* and *tri*, "three," which occur in all seven; and it is only occasionally that it has been found necessary to adopt a word or root which occurs in less than four of them. The result is that instead of the unpleasant mixture of Romance elements with words taken arbitrarily from English and German which makes a great part of the vocabulary of Esperanto unintelligible to learners who know only one language, Idiom Neutral offers a vocabulary which is practically Romance-Latin. Thus the Idiom Neutral *ornit*, "bird," and *diurn*, "day," are almost self-interpreting even apart from any context, while the Esperanto *bird* and *tag* are unintelligible except to those who know English and German; and as the former is pronounced in Esperanto approximately as English *beard*, it is only intelligible to English speakers when written, not when spoken. In its grammar Idiom Neutral is almost entirely a-posteriori on a Romance basis, generally following French, sometimes in a somewhat slavish and unintelligent fashion, as in the use of *eske* as an interrogative particle, and of *leplu* as the mark of the superlative, although there is no definite article in Idiom Neutral. On the whole, there can be no doubt that Idiom Neutral is the simplest language that has yet been devised, and the most easily understood by any educated European; those who take several days to learn to read Esperanto find that they can read Idiom Neutral in as many minutes. Compare the following extract from a letter written by a Norwegian doctor to a colleague in Russia with the specimens given under the headings VOLAPÜK and ESPERANTO:—

Idiom Neutral es usabl no sole pro skribasion, ma et pro perlasion; sikause in kongres sekuant internasional de medisinisti mi av intension usar ist idiom pro mie raport di maladitet "lupus," e mi esper esar komprended per omni medisinisti present.

But the construction of such languages is by no means so easy as would at first sight appear. All a-posteriori systems are liable to various defects, the inevitable result of the conflict between their old and new elements, and the difficulties and embarrassments of an arbitrary selection. Thus Idiom Neutral, which ought to be the most perfect of these attempts, admits homonyms (*kar*="carriage" and "dear," adj.), alternative forms such as *sientik* and *sientifik*, and ambiguities such as *filosofi*, which is both an abstract noun and the plural of *filosof*, "philosopher." Esperanto is better constructed in this respect; but it often only avoids confusion by arbitrary alteration of its words.

Another difficulty is that of national associations. No one likes to have his own language travestied. Thus Esperanto, which looks like bad Italian, is on that account less popular among the speakers of Romance languages (except in France) than elsewhere. It is a significant fact that none of the inventors of these languages base them on their native speech.

And then, these languages are not international after all. A really international language ought to be as acceptable to speakers of Arabic, Chinese or Japanese as to a European. Even from a European point of view they are not wholly international.

And they are not independent languages: they are only parasites—sickly parasites—on other languages. Their vocabularies are liable to incessant change and addition; and the meanings of their words are liable to be misunderstood in different ways by speakers of different languages. It is no answer to say that they are only auxiliary languages, which are not intended to supplant the national languages; for every artificial language must, at first at least, content itself with this rôle.

It is evident that the a-priori is the only basis which is really international, neutral and independent. And it is a significant fact that the earlier attempts were all a-priori. But all these attempts—beginning with Dalgarno's *Ars signorum* (1661) and Wilkins' well-known *Real Character* (1668)—have been failures. They were failures because the ground was not sufficiently prepared. A great part of Wilkins' folio is taken up with attempts to lay the necessary foundations. He saw—what none of his successors has yet seen—the necessity of a knowledge of the formation of sounds and the principles of their representation; and his sketch of phonetics is still valuable. His classification of the ideas expressed by language is an attempt to do what was afterwards done by Linnaeus and his successors and by Roget in the *Thesaurus of English Words and Phrases*.

Wilkins was only a dilettante, because the greater part of science was then only in the dilettante stage. We have a right now to demand that our universal language shall be the work, not of dilettantes, but of experts: that is, of trained philologists.

Now that the ground has been prepared—now that the principles of linguistic science are the common property of the educated world, and the chief languages of the earth have been made accessible, and whole families of languages have been included in comparative grammars and dictionaries—we have a right to ask that no one shall henceforth come before the public as the inventor of a new language till he has made himself acquainted with those branches of the science of language which form the natural foundation for such a work.

The first step in constructing an artificial language is to settle what sounds it is to contain. The answer, of course, is: the easiest. To the man in the street the only easy sounds are those of his own language. The question, which sounds are easiest in themselves, can only be settled by means of general practical phonetics, which often leads to conclusions directly contradicting popular prejudices. Then comes the question, how these sounds are to be written. It would be an easy matter to re-write Esperanto in the alphabet, say, of the International Phonetic Association, instead of its present antiquated and unpractical orthography; but the mere fact that the author of Esperanto did not take the trouble to make himself acquainted with the principles of phonetics and sound-representation before attacking so stupendous a problem makes us sceptical of his competence for the rest of his task.

The grammar of the new language must not be a mere imitation of that of Latin or an ordinary modern European language: it must be based on first principles. The inventor, after carefully considering the grammatical structure of languages of different types, must not only pick out what is best in each, but must consider whether he cannot do still better.

As regards the vocabulary, we are told that the inventor of Esperanto in his first attempts to construct a new language began with forming his roots by arbitrary combinations of letters, but failed to arrive at any satisfactory result in this way. It is, in fact, impossible to construct words arbitrarily: the attempt to do so inevitably results in distorted reminiscences of words already familiar to the experimenter. There are only two ways in which it is possible to construct an a-priori vocabulary: the *schematic* and the *symbolic*. The systems of Dalgarno and Wilkins belong to the former class. Wilkins's vocabulary is founded on a classification of all ideas under 40 categories, each expressed by the combination of a consonant and a vowel in a certain arbitrary (partly alphabetic) order. Thus *de* signifies "element," from which is formed the first subdivision *deb*, "fire," from which, again, is formed the further subdivision *deba*, "flame." The objections to this method are that there is no direct connexion between the words and their meanings, and that it involves not only knowing by heart the endless categories, and subdivisions of these, on which it is founded, but also their order and number—a task beyond any human memory. Even if it were not, no one would care to learn a classification which the advance of knowledge might render obsolete in a few years—together with the language itself.

The symbolic method, on the other hand, aims at establishing a direct association between the word and the idea it expresses, as is already the case, to some extent, in existing languages. Thus we have imitative words such as *cuckoo*, interjectional words, such as *hush*, and specially symbolic or gesture-words, such as *thou*, *me*, *mother*.

The difficulty in carrying out the symbolic principle is that the associations are few and often vague. But the material is sufficient, if handled in a practical spirit. However far removed from theoretical perfection the result might be, it would have at least two advantages:—(1) There would be none of that waste of material which is common to all natural languages and those artificial ones which are founded on them. (2) This would result in a brevity far exceeding that of the opposite type of language.

A well constructed a-priori language would, indeed, have many uses far transcending those of a rough-and-ready language of the Esperanto type. It would be more than a mere auxiliary language. It would be useful not only as a means of international communication, but as a means of expression superior in most respects to the native language: as an aid, not a hindrance, to accurate thought and scientific exactitude. It would repel by its unfamiliarity. It would have to be learnt; and it would not be learnt without effort, for its use would imply accurate thought and emancipation from the associations of the native language. But the difficulties would be impartially distributed: the new language would not necessarily be more difficult for the speakers of one language than for those of another.

The obstacles to the construction and adoption of an a-priori language are many; and meanwhile the need is pressing. So it is possible that the problem may be partially solved in the near future by the provisional adoption of an adapted language. Although such a language would not be very acceptable to non-European nations, it would still be easier to them than any European language. But whatever language may be adopted, it must be imposed by a competent tribunal, which, as in all analogous cases, will refuse to consider any scheme which has not been worked out by experts—that is, by scientific linguists. (H. Sw.)

UNIVERSITIES.[1] The medieval Latin term *universitas* (from which the English word "university" is derived) was originally employed to denote any community or corporation regarded under its collective aspect. When used in its modern sense, as denoting a body devoted to learning and education, it required the addition of other words in order to complete the definition—the most frequent form of expression being "universitas magistrorum et scholarium" (or "discipulorum"). In the course of time, probably towards the latter part of the 14th century, the term began to be used by itself, with the exclusive meaning of a community of teachers and scholars whose corporate existence had been recognized and sanctioned by civil or ecclesiastical authority or by both. But the more ancient and customary designation of such communities in medieval times (regarded as places of instruction) was "studium" (and subsequently "studium generale"), a term implying a centre of instruction for all.[2] The expressions "universitas studii" and "universitatis collegium" are also occasionally to be met with in official documents.

It is necessary, however, to bear in mind, on the one hand, that a university often had a vigorous virtual existence long before it obtained that legal recognition which entitled it, technically, to take rank as a "studium generale," and, on the other hand, that hostels, halls and colleges, together with complete courses in all the recognized branches of learning, were by no means necessarily involved in the earliest conception of a university. The university, in its earliest stage of development, appears to have been simply a scholastic gild—a spontaneous combination, that is to say, of teachers or scholars, or of both combined, and formed probably on the analogy of the trades gilds, and the gilds of aliens in foreign cities, which, in the course of the 13th and 14th centuries, are to be found springing up in most of the great European centres. The design of these organizations, in the first instance, was little more than that of securing mutual protection—for the craftsman, in the pursuit of his special calling; for the alien, as lacking the rights and privileges inherited by the citizen. And so the university, composed as it was to a great extent of students from foreign countries, was a combination formed for the protection of its members from the extortion of the townsmen and the other annoyances incident in medieval times to residence in a foreign state. It was a first stage of development in connexion with these primary organizations, when the chancellor of the cathedral, or some other authority, began, as we shall shortly see, to accord to other masters permission to open other schools than the cathedral school in the neighbourhood of his church; a further stage was reached when a licence to teach—granted only after a formal examination—empowered a master to carry on his vocation at any similar centre that either already existed or might afterwards be formed throughout Europe—"facultas

[1] It is the design of the present article to exhibit the universities in their general historical development; more detailed information respecting the *present condition* of each will be found in the separate articles under topographical headings.

[2] Denifle, *Die Universitäten des Mittelalters*, i. 1–29.

ubique docendi." It was a still further development when it began to be recognized that, without a licence from either pope, emperor or king, no "studium generale" could be formed possessing this right of conferring degrees, which originally meant nothing more than licences to teach.

In the north of Europe such licences were granted by the Chancellor Scholasticus, or some other officer of a cathedral church; in the south it is probable that the gilds of masters (when these came to be formed) were at first free to grant their own licences, without any ecclesiastical or other supervision. But in all cases such permissions were of a purely local character. Gradually, however, towards the end of the 12th century, a few great schools claimed from the excellence of their teaching to be of more than merely local importance. Practically a doctor of Paris or Bologna would be allowed to teach anywhere; while those great schools began to be known as *studia generalia*, *i.e.* places resorted to by scholars from all parts. Eventually the term came to have a more definite and technical signification. The emperor Frederick II. set the example of attempting to confer by an authoritative bull upon his new school at Naples the prestige which the earlier *studia* had acquired by reputation and general consent. In 1229 Gregory IX. did the same for Toulouse, and in 1233 added to its original privileges a bull by which any one who had been admitted to the doctorate or mastership in that university should have the right to teach anywhere without further examination. Other *studia generalia* were subsequently founded by papal or imperial bulls; and in 1292 even the oldest universities, Paris and Bologna, found it desirable to obtain similar bulls from Nicolas IV. From this time the notion began to prevail among the jurists that the essence of the *studium generale* was the privilege of conferring the *jus ubicunque docendi*, and that no new *studium* could acquire that position without a papal or imperial bull. By this time, however, there were a few *studia generalia* (*e.g.* Oxford) whose position was too well established to be seriously questioned, although they had never obtained such a bull; these were held to be *studia generalia ex consuetudine*. A few Spanish universities founded by royal charter were held to be *studia generalia respectu regni*. The word *universitas* was originally applied only to the scholastic gild (or gilds) within the *studium*, and was at first not used absolutely; the phrase was always *universitas magistrorum*, or *scholarium* or *magistrorum et scholarium*. By the close of the medieval period, however, the distinction between the terms *studium generale* and *universitas* was more or less lost sight of, and in Germany especially the term *universitas* began to be used alone.[1]

Meaning of "studium generale."

Origin of the term "university."

In order, however, clearly to understand the conditions under which the earliest universities came into existence, it is necessary to take account, not only of their organization, but also of their studies, and to recognize the main influences which, from the 6th to the 12th century, served to modify both the theory and the practice of education. In the former century, the schools of the Roman empire, which had down to that time kept alive the traditions of pagan education, had been almost entirely swept away by the barbaric invasions. The latter century marks the period when the institutions which supplied their place—the episcopal schools attached to the cathedrals and the monastic schools—attained to their highest degree of influence and reputation. Between these and the schools of the empire there existed an essential difference, in that the theory of education by which they were pervaded was in complete contrast to the simply secular theory of the schools of paganism. The cathedral school taught only what was supposed to be necessary for the education of the priest; the monastic school taught only what was supposed to be in harmony with the aims of the monk. But between the pagan system and the Christian system by which it had been superseded there yet existed something that was common to both: the latter, even in the narrow and meagre instruction which it imparted, could not altogether dispense with the ancient text-books, simply because there were no others in existence. Certain treatises of Aristotle, of Porphyry, of Martianus Capella and of Boetius continued consequently to be used and studied; and in the slender outlines of pagan learning thus still kept in view, and in the exposition which they necessitated, we recognize the main cause which prevented the thought and literature of classic antiquity from falling altogether into oblivion.

History of learning before the university era.

Under the rule of the Merovingian dynasty even these scanty traditions of learning declined throughout the Frankish dominions; but in England the designs of Gregory the Great, as carried out by Theodorus, Bede and Alcuin, resulted in a great revival of education and letters. The influence of this revival extended in the 8th and 9th centuries to Frankland, where Charlemagne, advised and aided by Alcuin, effected a memorable reformation, which included both the monastic and the cathedral schools; while the school attached to the imperial court, known as the Palace School, also became a famous centre of learned intercourse and instruction.

Revival in time of Charlemagne.

But the activity thus generated, and the interest in learning which it served for a time to diffuse, well-nigh died out amid the anarchy which characterizes the 10th century in Latin Christendom, and it is at least questionable whether any real connexion can be shown to have existed between this earlier revival and that remarkable movement in which the university of Paris had its origin. On the whole, however, a clearly traced, although imperfectly continuous, succession of distinguished teachers has inclined the majority of those who have studied this obscure period to conclude that a certain tradition of learning, handed down from the famous school over which Alcuin presided at the great abbey of St Martin at Tours, continued to survive, and became the nucleus of the teaching in which the university took its rise. But, in order adequately to explain the remarkable development and novel character which that teaching assumed in the course of the 12th and 13th centuries, it is necessary to take account of the operation of certain more general causes to which the origin of the great majority of the earlier universities may in common unhesitatingly be referred. These causes are—(1) the introduction of new subjects of study, as embodied in a new or revived literature; (2) the adoption of new methods of teaching which were rendered necessary by the new studies; (3) the growing tendency to organization which accompanied the development and consolidation of the European nationalities.

General causes of formation of first universities.

That the earlier universities took their rise to a great extent in endeavours to obtain and provide instruction of a kind beyond the range of the monastic and cathedral schools appears to be very generally admitted, but with respect to the origin of the first European university—that of Salerno in Italy, which became known as a school of medicine as early as the 9th century—the circumstances are pronounced by a recent investigator to be "veiled in impenetrable obscurity."[2] One writer[3] derives its origin from an independent tradition of classical learning which continued to exist in Italy down to the 10th century. Another writer[4] maintains that it had its beginning in the teaching at the famous Benedictine monastery of Monte Cassino, where the study of medicine was undoubtedly pursued. But the most authoritative researches point to the conclusion that the medical system of Salerno was originally an outcome of the Graeco-Roman tradition of the old Roman world, and the Arabic medicine was not introduced till the highest fame of the Civitas Hippocratica was passing away. It *may* have been influenced by the late survival of the Greek language in southern Italy, though this cannot be proved. In the first half of the 9th century the emperor at Constantinople sent to the Caliph

Mamoun at Bagdad a considerable collection of Greek manuscripts, which seems to have given the earliest impulse to the study of the Hellenic pagan literature by the Saracens. The original texts were translated into Arabic by Syrian Christians, and these versions were, in turn, rendered into Latin for the use of teachers in the West. Of the existence of such versions we have evidence, according to Jourdain,[1] long prior to the time when Constantine the African (d. 1087) began to deliver his lectures on the science at Salerno, although these early versions have since altogether disappeared. Under his teaching the fame of Salerno as a medical school became diffused all over Europe; it was distinguished also by its catholic spirit, and, at a time when Jews were the object of religious persecution throughout Europe, members of this nationality were to be found both as teachers and learners at Salerno. Ordericus Vitalis, who wrote in the first half of the 12th century, speaks of it as then long famous. In 1231 it was constituted by the emperor Frederick II. the only school of medicine in the kingdom of Naples.

Bologna. The great revival of legal studies which took place at Bologna about the year 1000 had also been preceded by a corresponding activity elsewhere—at Pavia by a famous school of Lombard law, and at Ravenna by a yet more important school of Roman law. And in Bologna itself we have evidence that the Digest was known and studied before the time of Irnerius (1100–30), a certain Pepo being named as lecturing on the text about the year 1076. The traditional story about the "discovery" of the Pandects at Amalfi in 1135 was disproved even before the time of Savigny. Schulte has shown that the publication of the *Decretum* of Gratian must be placed earlier than the traditional date, *i.e.* not later than 1142. This instruction again was of a kind which the monastic and cathedral schools could not supply, and it also contributed to meet a new and pressing demand. The neighbouring states of Lombardy were at this time increasing rapidly in population and in wealth; and the greater complexity of their political relations, their growing manufactures and commerce, demanded a more definite application of the principles embodied in the codes that had been handed down by Theodosius and Justinian. But the distinctly secular character of this new study, and its close connexion with the claims and prerogatives of the Western emperor, aroused at first the susceptibilities of the Roman see, and for a time Bologna and its civilians were regarded by the church with distrust and even with alarm. These sentiments were not, however, of long duration. In the year 1151 the appearance of the *Decretum* of Gratian, largely compiled from spurious documents, invested the studies of the canonist with fresh importance; and numerous decrees of past and almost forgotten pontiffs now claimed to take their stand side by side with the enactments contained in the *Corpus Juris Civilis*. They constituted, in fact, the main basis of those new pretensions asserted with so much success by the popedom in the course of the 12th and 13th centuries. It was necessary, accordingly, that the *Decretum* should be known and studied beyond the walls of the monastery or the episcopal palace, and that its pages should receive authoritative exposition at some common centre of instruction. Such a centre was to be found in Bologna. The needs of the secular student and of the ecclesiastical student were thus brought for a time into accord, and from the days of Irnerius down to the close of the 13th century we have satisfactory evidence that Bologna was generally recognized as the chief school both of the civil and the canon law.[2] It has, indeed, been asserted that university degrees were instituted there as early as the pontificate of Eugenius III. (1145–53), but the statement rests on no good authority, and is in every way improbable. There is, however, another tradition which is in better harmony with the known facts. When Barbarossa marched his forces into Italy on his memorable expedition of 1155, and reasserted those imperial claims which had so long

Decretum of Gratian and the canon law.

[2] Denifle, *Die Universitäten*, &c., i. 48.

lain dormant, the professors of the civil law and their scholars, but more especially the foreign students, gathered round the Western representative of the Roman Caesars, and besought his intervention in their favour in their relations with the citizens of Bologna. A large proportion of the students were probably from Germany; and it did not escape Frederick's penetration that the civilian might prove an invaluable ally in the assertion of his imperial pretensions. He received the suppliants graciously, and, finding that their grievances were real, especially against the landlords in whose houses they were domiciled, he granted the foreign students substantial protection, by conferring on them certain special immunities and privileges (November 1158).[3] These privileges were embodied in the celebrated *Authentica, Habita*, in the *Corpus Juris Civilis* of the empire (bk. iv. tit. 13), and were eventually extended so as to include all the other universities of Italy. In them we may discern the precedent for that state protection of the university which, however essential at one time for the security and freedom of the teacher and the taught, has been far from proving an unmixed benefit—the influence which the civil power has thus been able to exert being too often wielded for the suppression of that very liberty of thought and inquiry from which the earlier universities derived in no small measure their importance and their fame.

Foreign students at Bologna

But, though there was a flourishing school of study, it is to be observed that Bologna did not possess a university so early as 1158. Its first university was not constituted until the close of the 12th century. The "universities" at Bologna were, as Denifle has shown, really student gilds, formed under influences quite distinct from the protecting clauses of the *Authentica*, and suggested, as already noted, by the precedent of those foreign gilds which, in the course of the 12th century, began to rise throughout western Europe. These were originally only two in number, the *Ultramontani* and the *Citramontani*, and arose out of the absolute necessity, under which residents in a foreign city found themselves, of obtaining by combination that protection and those rights which they could not claim as citizens. These societies were modelled, Denifle considers, not on the trade gilds which rose in Bologna in the 13th century, but on the Teutonic gilds which arose nearly a century earlier in north-western Europe, being essentially "spontaneous confederations of aliens on a foreign soil." Originally, they did not include the native student element and were composed exclusively of students in law.

The "universities" at Bologna.

The power resulting from this principle of combination, when superadded to the privileges conferred by Barbarossa, gave to the students of Bologna a superiority of which they were not slow to avail themselves. Under the leadership of their rector, they extorted from the citizens concessions which raised them from the condition of an oppressed to that of a specially privileged class. The same principle, when put in force against the professors, reduced the latter to a position of humble deference to the very body whom they were called upon to instruct, and imparted to the entire university that essentially democratic character by which it was afterwards distinguished. It is not surprising that such advantages should have led to an imitation and extension of the principle by which they were obtained. Denifle considers that the "universities" at Bologna were at one time certainly more than four in number, and we know that the Italian students alone were subdivided into two—the Tuscans and the Lombards. In the centres formed by secession from the parent body a like subdivision took place. At Vercelli there were four *universitates*, composed respectively of Italians, English, Provençals and Germans; at Padua there were similar divisions into Italians,

Their democratic character.

Other similar communities in Italy.

[3] See Savigny, *Gesch. d. röm. Rechts*, iii. 152, 491–92. See also Giesebrecht, *Gesch. d. Kaiserzeit* (ed. 1880), v. 51–52. The story is preserved in a recently discovered metrical composition descriptive of the history of Frederick I.; see *Sitzungsberichte d. Bairisch. Akad. d. Wissenschaft, Phil.-Hist. Klasse* (1879), ii. 285. Its authenticity is called in question by Denifle, but it would seem to be quite in harmony with the known facts.

French (*i.e. Francigenae*, comprising both English and Normans), Provençals (including Spaniards and Catalans). When, accordingly, we learn from Odofred that in the time of the eminent jurist Azo, who lectured at Bologna about 1200, the number of the students there amounted to some ten thousand, of whom the majority were foreigners, it seems reasonable to conclude that the number of these confederations of students (*societates scholarium*) at Bologna was yet greater. It is certain that they were not formed simultaneously, but, similarly to the free gilds, one after the other—the last in order being that of the Tuscans, which was composed of students from Tuscany, the Campagna and Rome. Nor are we, again, to look upon them as in any way the outcome of those democratic principles which found favour in Bologna, but rather as originating in the traditional home associations of the foreign students, fostered, however, by the peculiar conditions of their university life. As the Tuscan division (the one least in sympathy, in most respects, with Teutonic institutions) was the last formed, so, Denifle conjectures, the German "university" may have introduced the conception which was successively adopted by the other nationalities.

The rector. In marked resemblance to the gilds, these confederations were presided over by a common head, the "rector scholarium," an obvious imitation of the "rector societatum" or "artium" of the gild, but to be carefully distinguished from the "rector scholarum" or director of the studies, with whose function the former officer had, at this time, nothing in common. Like the gilds, again, the different nations were represented by their "consiliarii," a deliberative assembly with whom the rector habitually took counsel.

Mature age of the students. While recognizing the essentially democratic character of the constitution of these communities, it is to be remembered that the students, unlike the majority at Paris and later universities, were mostly at this time of mature years. As the civil law and the canon law were at first the only branches of study, the class whom they attracted were often men already filling office in some department of the church or state—archdeacons, the heads of schools, canons of cathedrals, and like functionaries forming a considerable element in the aggregate. It has been observed, indeed, that the permission accorded them by Frederick I. of choosing, in all cases of dispute, their own tribunal, thus constituting them, to a great extent, *sui juris*, seems to presuppose a certain maturity of judgment among those on whom this discretionary power was bestowed.

Formation of the universitates. Innocent IV., in according his sanction to the new statutes of the university in 1253, refers to them as drawn up by the "rectores et universitas scholarium Bononiensium."

Faculties instituted. About the year 1200 were formed the two faculties of medicine and philosophy (or "the arts"[1]), the former being somewhat the earlier. It was developed, as that of the civil law had been developed, by a succession of able teachers, among whom Thaddeus Alderottus was especially eminent. The faculty of arts, down to the 14th century, scarcely attained to equal eminence. The teaching of theology remained for a long time exclusively in the hands of the Dominicans; and it was not until the year 1360 that Innocent VI. recognized Bologna as a "studium generale" in this branch—in other words, as a place of theological education for all students, with the power of conferring degrees of universal validity.

Account of the university by Anglicus. In the year 1371 the cardinal legate, Anglicus, compiled, as chief director of ecclesiastical affairs in the city, an account of the university, which he presented to Urban V. The information it supplies is, however, defective, owing to the fact that only the professors who were in receipt of salaries from the municipality are mentioned. Of these there were twelve of civil law and six of canon law; three of medicine, three of practical medicine and one of surgery; two of logic, and one each of astrology, rhetoric and notarial practice. The professors of theology, who, as members of the religious orders, received no state remuneration, are unmentioned. The significance of the term "college," as first employed at Bologna, differed, like that of "university," from that which it subsequently acquired. The *collegia* of the doctors no more connoted the idea of a place of residence than did the *universitates* of the students. There were the College of Doctors of Civil Law, the College of Doctors of Canon Law, the College of Doctors in Medicine and Arts and (from 1352) the College of Doctors in Theology. Though the professors were largely dependent upon the students, they had separate organizations of their own; the college alone was concerned in the conferment of degrees. Each faculty was therefore at Bologna entirely independent of every other (except for the union of medicine and arts): the only connecting link between them was the necessity of obtaining their degrees (after 1219) from the same chancellor, the archdeacon of Bologna. The decline in the reputation of the *studium* from about 1250 was largely due to the successful efforts of the doctors to exclude all but Bolognese citizens from membership of the doctoral colleges (which alone possessed the valuable "right of promotion"), and from the more valuable salaried chairs. They even attempted and partially succeeded in restricting these privileges to members of their own families.

The universities at Bologna.

The earliest colleges. Colleges as places of residence for students existed, however, at Bologna at a very early date, but it is not until the 14th century that we find them possessing any organization; and the humble *domus*, as it was termed, was at first designed solely for necessitous students, not being natives of Bologna. A separate house, with a certain fund for the maintenance of a specified number of scholars, was all that was originally contemplated. Such was the character of that founded by Zoen, bishop of Avignon, in February 1256 (O.S.), the same month and year, it is to be noted, in which the Sorbonne was founded in Paris. It was designed for the maintenance of eight scholars from the province of Avignon, under the supervision of three canons of the church, maintaining themselves in the university. Each scholar was to receive 24 Bolognese lire annually for five years. The college of Brescia was founded in 1326 by William of Brescia, archdeacon of Bologna, for poor foreign students without distinction as to nationality. The Spanish college, founded in 1364, for twenty-four Spanish scholars and two chaplains, is noted by Denifle as the one college founded in medieval times which still exists on the Continent.

Origin of university of Paris. Of the general fact that the early universities rose in response to new wants the commencement of the university of Paris supplies us with a further illustration. The study of logic, which, prior to the 12th century, was founded exclusively on one or two meagre compends, received about the year 1100, on two occasions, a powerful stimulus—in the first instance, from the memorable controversy between Lanfranc and Berengar; in the second, from the no less famous controversy between Anselm and Roscellinus. A belief sprang up that an intelligent apprehension of spiritual truth depended on a correct use of prescribed methods of argumentation.

Study of logic. Dialectic was looked upon as "the science of sciences"; and when, somewhere in the first decade of the 12th century, William of Champeaux opened in Paris a school for the more advanced study of dialectic as an art, his teaching was attended with marked success. Among his pupils was Abelard, in whose hands the study made a yet more notable advance; so that, by the middle of the century, we find John of Salisbury, on returning from the French capital to England, relating with astonishment, not unmingled with contempt, how all learned Paris had gone well-nigh mad in its pursuit and practice of the new dialectic.

Teaching of Abelard. Abelard taught in the first instance at the cathedral school at Notre Dame, and subsequently at the schools on the Montagne Ste Geneviève, of which he was the founder, and where he imparted to logic its new development. But in 1147 the secular canons of Ste Geneviève

[1] The arts course of study was that represented by the ancient *trivium* (*i.e.* grammar, logic and rhetoric) and the *quadrivium* (*i.e.* arithmetic, geometry, music and astronomy) as handed down from the schools of the Roman empire. See J. B. Mullinger's *History of the University of Cambridge*, i. 24–27.

gave place to canons regular from St Victor; and henceforth the school on the former foundation was merely a school for the teaching of theology, and was attended only by the members of the house.[1]

Study of theology.

The schools out of which the university arose were those attached to the cathedral on the Île de la Cité, and presided over by the chancellor—a dignitary who must be carefully distinguished from the later chancellor of the university. For a long time the teachers lived in separate houses on the island, and it was only by degrees that they combined themselves into a society, and that special buildings were constructed for their class-work. But the flame which Abelard's teaching had kindled was not destined to expire. Among his pupils was Peter Lombard, who was bishop of Paris in 1159, and widely known to posterity as the compiler of the famous volume of the *Sentences*. The design of this work was to place before the student, in as strictly logical a form as practicable, the views (*sententiae*) of the fathers and all the great doctors of the church upon the chief and most difficult points in the Christian belief. Conceived with the purpose of allaying and preventing, it really stimulated, controversy. The logicians seized upon it as a great storehouse of indisputable major premises, on which they argued with renewed energy and with endless ingenuity of dialectical refinement; and upon this new compendium of theological doctrine, which became the text-book of the middle ages, the schoolmen, in their successive treatises *Super sententias*, expended a considerable share of that subtlety and labour which still excite the astonishment of the student of metaphysical literature.

Lombard's "Sentences."

It is in these prominent features in the history of these early universities—the development of new methods of instruction concurrently with the appearance of new material for their application—that we find the most probable solution of the question as to how the university, as distinguished from the older cathedral or monastic schools, was first formed. In a similar manner, it seems probable, the majority of the earlier universities of Italy—Reggio, Modena, Vicenza, Padua and Vercelli—arose, for they had their origin independently alike of the civil and the papal authority. Instances, it is true, occur, which cannot be referred to this spontaneous mode of growth. The university of Naples, for example, was founded solely by the fiat of the emperor Frederick II. in the year 1224; and, if we may rely upon the documents cited by Denifle, Innocent IV. about the year 1245 founded in connexion with the curia a "studium generale,"[2] which was attached to the papal court, and followed it when removed from Rome, very much as the Palace School of Charles the Great accompanied that monarch on his progresses.

Rise of other early universities.

As the university of Paris became the model, not only for the universities of France north of the Loire, but also for the great majority of those of central Europe as well as for Oxford and Cambridge, some account of its early organization will here be indispensable. Such an account is rendered still further necessary by the fact that the recent and almost exhaustive researches of Denifle, the Dominican father, have led him to conclusions which on some important points run altogether counter to those sanctioned by the high authority of Savigny

Early organization of university of Paris.

The original university, as already stated, took its rise entirely out of the movement carried on by teachers on the island, who taught by virtue of the licence conferred by the chancellor of the cathedral. In the second decade of the 13th century, it is true, we find masters withdrawing themselves from his authority by repairing to the left bank of the Seine and placing themselves under the jurisdiction of the abbot of the monastery of Ste Geneviève; and in 1255 this dignitary is to be found appointing a chancellor whose duty it should be to confer *licentia docendi* on those candidates who were desirous of opening schools in that district. But it was around the bestowal of this licence by the chancellor of Notre Dame, on the Île de la Cité, that the university of Paris grew up. It is in this licence that the whole significance of the master of arts degree is contained; for what is technically known as admission to that degree was really nothing more nor less than receiving the chancellor's permission to "incept," and by "inception" was implied the master's formal entrance upon, and commencement of, the functions of a duly licensed teacher, and his recognition as such by his brothers in the profession. The previous stage of his academic career, that of bachelordom, had been one of apprenticeship for the mastership; and his emancipation from this state was symbolized by placing the magisterial cap (*biretta*) upon his head, a ceremony which, in imitation of the old Roman ceremony of manumission, was performed by his former instructor, "under whom" he was said to incept. He then gave a formal inaugural lecture, and, after this proof of magisterial capacity, was welcomed into the society of his professional brethren with set speeches, and took his seat in his master's chair.

Inception.

The bachelor of arts.

This community of teachers of recognized fitness did not in itself suffice to constitute a university, but some time between the years 1150 and 1170, the period when the *Sentences* of Peter Lombard were given to the world, the university of Paris came formally into being. Its first written statutes were not, however, compiled until about the year 1208, and it was not until long after that date that it possessed a "rector." Its earliest recognition as a legal corporation belongs to about the year 1211, when a brief of Innocent III. empowered it to elect a proctor to be its representative at the papal court. By this permission it obtained the right to sue or to be sued in a court of justice as a corporate body.

The university formed.

This papal recognition was, however, very far from implying the episcopal recognition, and the earlier history of the new community exhibits it as in continual conflict alike with the chancellor, the bishop and the cathedral chapter of Paris, by all of whom it was regarded as a centre of insubordination and doctrinal licence. Had it not been, indeed, for the papal aid, the university would probably not have survived the contest; but with that powerful assistance it came to be regarded as the great Transalpine centre of orthodox theological teaching. Successive pontiffs, down to the great schism of 1378, made it one of the foremost points of their policy to cultivate friendly and confidential relations with the authorities of the university of Paris, and systematically to discourage the formation of theological faculties at other centres. In 1231 Gregory IX., in the bull *Parens Scientiarum*, gave full recognition to the right of the several faculties to regulate and modify the constitution of the entire university—a formal sanction which, in Denifle's opinion, rendered the bull in question the Magna Charta of the university.

Difficulties of first development.

In comparing the relative antiquity of the universities of Paris and Bologna, it is difficult to give an unqualified decision. The university of masters at the former was probably slightly anterior to the university of students at the latter; but there is good reason for believing that Paris, in reducing its traditional customs to statutory form, largely availed itself of the precedents afforded by the already existing code of the Transalpine centre. The fully developed university was divided into four faculties—three "superior," viz. those of theology, canon law and medicine, and one "inferior," that of arts, which was divided into four "nations." These nations, which included both professors and scholars, were—(1) the French nation, composed, in addition to the native element, of Spaniards, Italians and Greeks; (2) the Picard nation, representing the students from the north-east and from the Netherlands; (3) the Norman nation; (4) the English nation, comprising, besides students from the provinces under English rule, those from England, Ireland, Scotland and

The "nations."

[1] The view of Thurot (*De l'organisation de l'enseignement dans l'université de Paris*, pp. 4–7) that the university arose out of a combination of these several schools is rejected by Denifle (see *Die Universitäten*, &c., i. 653–94).

[2] Where the words *studium generale* are placed within marks of quotation they occur in the original charter of foundation of the university referred to.

Germany. The head of each faculty was the dean; the head of each nation was the proctor. The rector, who in the first instance was head of the faculty of arts, by whom he was elected, was eventually head of the whole university. In congregations of the university matters were decided by a majority of faculties; the vote of the faculty of arts was determined by a majority of nations. The chancellor of Notre Dame, whose functions were now limited to the conferment of the licence, stood as such outside the university or gild altogether, though as a doctor of theology he was always a member of that faculty. Only "regents," that is, masters actually engaged in teaching, had any right to be present or to vote in congregations. Neither the entire university nor the separate faculties had thus, it will be seen, originally a common head, and it was not until the middle of the 14th century that the rector became the head of the collective university, by the incorporation under him, first, of the students of the canon law and of medicine (which took place about the end of the 13th century), and, secondly, of the theologians, which took place about half a century later.

In the course of the 16th and 17th centuries this democratic constitution of the middle ages was largely superseded by the growth of a small oligarchy of officials. The tribunal of the university—the rector, deans and proctors—came to occupy a somewhat similar position to the old "Hebdomadal Board" of heads of colleges at Oxford and the *Caput* at Cambridge. Moreover, the teaching functions of the university, or rather of the faculty of arts, owing chiefly to the absence of any endowment for the regents or teaching graduates, practically passed to the colleges. Almost as much as the English universities, Paris came to be virtually reduced to a federation of colleges, though the colleges were at Paris less independent of university authority, while the smaller colleges sent their members to receive instruction in the larger ones (*collèges de plein exercise*), which received large numbers of non-foundation members. This state of things lasted till the French Revolution swept away the whole university system of the middle ages. It may be remarked that the famous Sorbonne was really the most celebrated college of Paris—founded by Robert de Sorbonne *circa* 1257—but as this college and the college of Navarre were the only college foundations which provided for students in theology, the close connexion of the former with the faculty and the use of its hall for the disputations of that body led to the word Sorbonne becoming a popular term for the theological faculty of Paris.

The Sorbonne.

Apart from the broad differences in their organization, the very conception of learning, it will be observed, was different at Bologna from what it was at Paris. In the former it was entirely professional—designed, that is to say, to prepare the student for a definite and practical career in after life; in the latter it was sought to provide a general mental training, and to attract the learner to studies which were speculative rather than practical. In the sequel, the less mercenary spirit in which Paris cultivated knowledge added immensely to her influence and reputation, which about the middle of the 14th century may be said to have reached their apogee. It had forty colleges, governed either by secular or religious communities, and numbered among its students representatives of every country in Europe (Jourdain, *Excursions historiques*, c. xiv.). The university became known as the great school where theology was studied in its most scientific spirit; and the decisions of its great doctors upon those abstruse questions which absorbed so much of the highest intellectual activity of the middle ages were regarded as almost final. The popes themselves, although averse from theological controversies, deemed it expedient to cultivate friendly relations with a centre of such importance for the purpose of securing their influence in a yet wider field. Down therefore to the time of the great schism (1378), they at once conciliated the university of Paris and consulted what they deemed to be the interests of the Roman see, by discouraging the creation of faculties of theology elsewhere. The apparent exceptions to this policy are easily explained: the four faculties of theology which they sanctioned in Italy—Pisa (1343), Florence (1349), Bologna (1362). and Padua (1363)—were designed to benefit the Italian monasteries, by saving the monks the expense and dangers of a long journey beyond the Alps; while that at Toulouse (1229) took its rise under circumstances entirely exceptional, being designed as a bulwark against the heresy of the Albigenses. The popes, on the other hand, favoured the creation of new faculties of law, and especially of the canon law, as the latter represented the source from which Rome derived her most warmly contested powers and prerogatives. The effects of this twofold policy were sufficiently intelligible: the withholding of each charter which it was sought to obtain for a new school of theology only served to augment the numbers that flocked to Paris; the bestowal of each new charter for a faculty of law served in like manner to divert a certain proportionate number from Bologna. These facts enable us to understand how it is that, in the 13th and 14th centuries, we find, even in France, a larger number of universities created after the model of Bologna than after that of Paris.

Paris and Bologna contrasted.

Papal policy.

In their earliest stage, however, the importance of these new institutions was but imperfectly discerned alike by the civil and the ecclesiastical power, and the first four universities of Italy, after Bologna, rose into existence, like Bologna itself, without a charter from either pope or emperor. Of these the first were those of Reggio nell' Emilia and Modena, both of which are to be found mentioned as schools of civil law before the close of the 12th century. The latter, throughout the 13th century, appears to have been resorted to by teachers of sufficient eminence to form a flourishing school, composed of students not only from the city itself, but also from a considerable distance. Both of them would seem to have been formed independently of Bologna, but the university of Vicenza was probably the outcome of a migration of the students from the former city, which took place in the year 1204. During the next fifty years Vicenza attained to considerable prosperity, and appears to have been recognized by Innocent III.; its students were divided into four nations, each with its own rector; and in 1264 it included in its professoriate teachers, not only of the civil law, but also of medicine, grammar and dialectic. The university of Padua was unquestionably the direct result of the migration in 1222 of a considerable number of students from Bologna. Some writers, indeed, have inferred that the "studium" in the latter city was transferred in its entirety, but the continued residence of a certain proportion in Bologna is proved by the fact that two years later we find them appealing to Honorius III. in a dispute with the civic authorities. In the year 1228 the students of Padua were compelled by circumstances to transfer their residence to Vercelli, and the latter city guaranteed them, besides other privileges, the right to rent no less than five hundred lodging-houses at a fixed rental for a period of eight years. At first Padua was a school only of the civil and canon law; and during the oppressive tyranny of Ezzelin (1237–60) the university maintained its existence with some difficulty. But in the latter part of the century it incorporated the faculties of grammar, rhetoric and medicine, and became known as one of the most flourishing schools of Italy, and a great centre of the Dominicans, at that time among the most active promoters of learning.

Reggio and Modena.

Vicenza.

Padua.

The university of Naples was founded by the emperor Frederick II. in the year 1225, as a school of theology, jurisprudence, the arts and medicine—his design being that his subjects in the kingdom of Naples should find in the capital adequate instruction in every branch of learning, and "not be compelled in the pursuit of knowledge to have recourse to foreign nations or to beg in other lands." In the year 1231, however, he decreed that the faculty of medicine should cease to exist, and that the study should be pursued nowhere in the kingdom but at Salerno. The university never attained to much eminence, and after the death of Frederick came for a time altogether to an end, but was restored

Naples.

in 1258 by King Manfred. In 1266 its faculty of medicine was reconstituted, and from 1272–74 Thomas Aquinas was one of its teachers of theology. *Vercelli.* The commencement of the university of Vercelli belongs to about the year 1228; it probably included, like Naples, all the faculties, but would seem to have been regarded with little favour by the Roman See, and by the year 1372 had ceased to exist, although mention of colleges of law and medicine is to be found after that date. *Piacenza.* The two universities of Piacenza and Pavia stand in close connexion with each other. The former is noted by Denifle as the earliest in Italy which was founded by virtue of a papal charter (6th February 1248), although the scheme remained for a long time inoperative. At length, in the year 1398, the university was reconstituted by Giovanni Galeazzo Visconti, duke of Milan, who in the same year caused the university of Pavia to be transferred thither. Piacenza now became the scene of a sudden but short-lived academic prosperity. We are told of no less than twenty-seven professors of the civil law—among them the celebrated Baldus; of twenty-two professors of medicine; of professors of philosophy, astrology, grammar and rhetoric; and of lecturers on Seneca and Dante. The faculty of theology would appear, however, never to have been duly constituted, and but one lecturer in this faculty is mentioned. With the death of Galeazzo in 1402, this precarious activity came suddenly to an end; and in 1404 the university had ceased to exist. Its history is, indeed, unintelligible, unless taken in conjunction with that of Pavia. *Pavia.* Even before Irnerius taught at Bologna, Pavia had been widely known as a seat of legal studies, and more especially of the Lombard law, although the evidence is wanting which would serve to establish a direct connexion between this early school and the university which was founded there in 1361, by virtue of the charter granted by the emperor Charles IV. The new "studium" included faculties of jurisprudence, philosophy, medicine and the arts, and its students were formally taken under the imperial protection, and endowed with privileges identical with those which had been granted to Paris, Bologna, Oxford, Orleans and Montpellier; but its existence in Pavia was suddenly suspended by the removal, above noted, of its students to Piacenza. It shared again in the decline which overtook the university of Piacenza after the death of Giovanni Galeazzo, and during the period from 1404 to 1412 it altogether ceased to exist. But in October 1412 the lectures were recommenced, and the university entered upon the most brilliant period of its existence. Its professors throughout the 15th century were men of distinguished ability, attracted by munificent salaries such as but few other universities could offer, while in the number of students who resorted thither from other countries, and more especially for the study of the civil law, Pavia had no rival in Italy but Padua. *Arezzo.* Arezzo appears to have been known as a centre of the same study so early as 1215, and its earliest statutes are assigned to the year 1255. By that time it had become a school of arts and medicine also; but for a considerable period after it was almost entirely deserted, and is almost unmentioned until the year 1338, when it acquired new importance by the accession of several eminent jurists from Bologna. In May 1355 it received its charter as a *studium generale* from Charles IV. After the year 1373 the school gradually dwindled, although it did not become altogether extinct until about the year 1470. *Rome.* The university of Rome (which is to be carefully distinguished from the school attached to the Curia) owed its foundation (1303) to Boniface VIII., and was especially designed by that pontiff for the benefit of the poor foreign students sojourning in the capital. It originally included all the faculties; but in 1318 John XXII. decreed that it should possess the power of conferring degrees only in the canon and civil law. The university maintained its existence throughout the period of the residence of the popes of Avignon, and under the patronage of Leo X. could boast in 1514 of no less than eighty professors. This imposing array would seem, however, to be but a fallacious test of the prosperity of the academic community, for it is stated that many of the professors, owing to the imperfect manner in which they were protected in their privileges, were in the receipt of such insufficient fees that they were compelled to combine other employments with that of lecturing in order to support themselves. An appeal addressed to Leo X. in the year 1513 represents the number of students as so small as to be sometimes exceeded by that of the lecturers ("ut quandoque plures sint qui legant quam qui audiant"). *Perugia.* Scarcely any of the universities in Italy in the 14th century attracted a larger concourse than that of Perugia, where the study chiefly cultivated was that of the civil law. The university received its charter as a *studium generale* from Clement V. in the year 1308, but had already in 1306 been formally recognized by the civic authorities, by whom it was commended to the special care and protection of the podestà. In common with the rest of the Italian universities, it suffered severely from the great plague of 1348–49; but in 1355 it received new privileges from the emperor, and in 1362 its first college, dedicated to Gregory the Great, was founded by the bishop of Perugia. *Treviso.* The university of Treviso, which received its charter from Frederick the Fair in 1318, was of little celebrity and but short duration. *Florence.* The circumstances of the rise of the university of Florence are unknown, but the earliest evidence of academic instruction belongs to the year 1320. The dispersion of the university of Bologna, in the March and April of the following year, afforded a favourable opportunity for the creation of a *studium generale*, but the necessary measures were taken somewhat tardily, and in the meantime the greater number of the Bolognese students had betaken themselves to Siena, where for the space of three years twenty-two professors gathered round them a body of enthusiastic students. Eventually the majority returned to Bologna, and when in 1338 that city was placed under an interdict by Benedict XII. another exodus of students repaired to Pisa, which in 1343 received from Clement VI. its charter as a *studium generale.* Closed in 1406, Pisa, aided by the powerful intervention of Lorenzo de' Medici, reopened in 1473, to undergo, however, a long series of vicissitudes which at last found a termination in 1850, when its fortunes were placed on a more stable basis, and it gradually acquired the reputation of ranking among the foremost universities of a reunited Italy. The charter of foundation for Florence, on the other hand, was not granted until May 31, 1349, when Clement VI. decreed that there should be instituted a *studium generale* in theology, jurisprudence, medicine and every other recognized faculty of learning, the teachers to be professors who had obtained the degree of doctor or master either at Bologna or Paris, or "some other *studium generale* of celebrity." On the 2nd of January 1364 the university also obtained the grant of imperial privileges from Charles IV. On 14th February 1388 it adopted a body of statutes which are still extant, and afford an interesting study in connexion with the university history of the period. The university now entered upon that brilliant period in its history which was destined to so summary an extinction. "It is almost touching," says Denifle, "to note how untiringly Florence exerted herself at this period to attract as teachers to her schools the great masters of the sciences and learning." In the year 1472, however, it was decided that Florence was not a convenient seat for a university, and its students joined the throngs which repaired to the reopened halls of Pisa. *Siena.* A special interest attaches to the rise of the university of Siena, as that of one which had made good its position prior to becoming recognized either by emperor or pope. Its beginning dates from about the year 1241, but its charter was first granted by the emperor Charles IV., at the petition of the citizens, in the year 1357. It was founded as a *studium generale* in jurisprudence, the arts and medicine. The imperial charter was confirmed by Gregory XII. in 1408, and the various bulls relating to the university which he subsequently issued afford a good illustration of the conditions of academic life in these times. Residence on the part of the students appears to have been sometimes dispensed with. The bishop of Siena was nominated chancellor of the university, just as, says the bull, he had been appointed to that office by the imperial authority. The graduates were to be admitted to the same privileges as those of Bologna or Paris; and a faculty of theology was added to the curriculum of studies. The university of Ferrara owes its foundation to the house of Este—Alberto, marquess of Este, having obtained from Boniface IX. in 1391 a charter couched in terms precisely similar to those of the charter for Pisa. In the first half of the 15th century the university was adorned by the presence of several distinguished humanists, but its fortunes were singularly chequered, and it would appear for a certain period to have been altogether extinct. It was, however, restored, and became in the latter part of the century one of the most celebrated of the universities of Italy. In the year 1474 its circle of studies comprised all the existing faculties, and it numbered no less than fifty-one professors or lecturers. In later times Ferrara has been noted chiefly as a school of medicine.

Ferrara.

Of the universities modelled on that of Paris, Oxford would appear to have been the earliest, and the manner of its development was probably similar. Certain schools, opened within the precincts of the dissolved nunnery of St Frideswyde and of Oseney abbey, are supposed to have been the nucleus round which the university grew up. In the year 1133 one Robert Pullen, a theologian of considerable eminence (but whether an Englishman or a Breton is uncertain), arrived from Paris and delivered lectures on the Bible. It has been maintained, on the authority of Gervase of Canterbury, that Vacarius, a native of Lombardy, who, in the latter half of the 12th century, incurred the displeasure of King Stephen by lecturing in England on the civil law, delivered lectures at Oxford. H. S. Denifle, however (*Die Entstehung der Universitäten*, p. 241), maintains that the naming of Oxford is a gratuitous assumption on the part of Gervase, and that we have, at best, only presumptive evidence of a *studium generale* there in the 12th century. Of this, Mr Rashdall inclines to find the beginning in a migration of English students from Paris about 1167 or 1168. In the first-mentioned year we are told by John of Salisbury that "France, the mildest and most civil of nations," has "expelled her foreign scholars" (*Materials for the History of Thomas Becket*, ed. Robertson, vi. pp. 235–36). At about the same time we hear of an edict of Henry II., during the quarrel with Becket, recalling all clerks holding benefices in England (as they loved their benefices), and forbidding all clerks in England to cross the Channel (ibid. i. pp. 53–54). The archbishop himself remarks that "The king wills that all scholars shall be compelled to return to their country or be deprived of their benefices" (ibid. vii. p. 146). Paris was at this time the great place of higher education for English students. No English school was a recognized *studium generale*. Immediately after 1168 allusions to Oxford as a *studium* and a *studium generale* begin to multiply. The natural inference is that the breaking off of relations between England and Paris in 1167 or 1168 led to the growth of a *studium generale* in Oxford, formed no doubt in the first instance of seceders from Paris. In the 13th century mention first occurs of university "chests," especially the Frideswyde chest, which were benefactions designed as funds for the assistance of poor students. Halls, or places of licensed residence for students, also began to be established. In the year 1257, when the bishop of Lincoln, as diocesan, had trenched too closely on the liberties of the community, the deputies from Oxford, when preferring their appeal to the king at St Albans, could venture to speak of the university as "schola secunda ecclesiae," or second only to Paris. Its numbers about this time were probably some three thousand; but it was essentially a fluctuating body, and whenever plague or tumult led to a temporary dispersion a serious diminution in its numerical strength generally ensued for some time after. Against such vicissitudes the foundation of colleges proved the most effectual remedy. Of these the three earliest were University College, founded in 1249 by William of Durham; Balliol College, founded about 1263 by John Balliol, the father of the king of Scotland of the same name; and Merton College, founded in 1264. The last-named is especially notable as associated with a new conception of university education, namely, that of collegiate discipline for the secular clergy, instead of for any one of the religious orders, for whose sole benefit all similar foundations had hitherto been designed. The statutes given to the society by Walter de Merton are not less noteworthy, as characterized not only by breadth of conception, but also by a careful and discriminating attention to detail, which led to their adoption as the model for later colleges, not only at Oxford but at Cambridge. Of the service rendered by these foundations to the university at large we have significant proof in the fact that, although representing only a small numerical minority in the academic community at large, their members soon obtained a considerable preponderance in the administration of affairs.

Oxford.

The university of Cambridge, although it rose into existence somewhat later than Oxford, may reasonably be held to have had its origin in the same century. There was probably a certain amount of educational work carried on by the canons of the church of St Giles, which gradually developed into the instruction belonging to a regular *studium*. In the year 1112 the canons crossed the river and took up their residence in the new priory in Barnwell, and their work of instruction acquired additional importance. In 1209 a body of students migrated thither from Oxford. Then, as early as the year 1224, the Franciscans established themselves in the town, and, somewhat less than half a century later, were followed by the Dominicans. At both the English universities, as at Paris, the Mendicants and other religious orders were admitted to degrees, a privilege which, until the year 1337, was extended to them at no other university. Their interest in and influence at these three centres was consequently proportionably great. In the years 1231 and 1233 certain royal and papal letters afford satisfactory proof that by that time the university of Cambridge was already an organized body with a chancellor at its head—a dignitary appointed by the bishop of Ely for the express purpose of granting degrees and governing the *studium*. In 1229 and 1231 the numbers were largely augmented by migrations from Paris and from Oxford. Cambridge, however, in its turn suffered from emigration; while in the year 1261, and again in 1381, the records of the university were wantonly burnt by the townsmen. Throughout the 13th century, indeed, the university was still only a very slightly and imperfectly organized community. Its endowments were of the most slender kind; it had no systematic code for the government of its members; the supervision of the students was very imperfectly provided for. Although both Oxford and Cambridge were modelled on Paris, their higher faculties never developed the same distinct organization; and while the two proctors at Cambridge originally represented "north" and "south," the "nations" are scarcely to be discerned. An important step in the direction of discipline was, however, made in the year 1276, when an ordinance was passed requiring that every one who claimed to be recognized as a scholar should have a fixed master within fifteen days after his entry into the university. The traditional constitution of the English universities was in its origin an imitation of the Parisian chancellor, modified by the absence of the cathedral chancellor. As Oxford was not in the 12th century a bishop's see, the bishop (in 1214, if not earlier) appointed a chancellor for the express purpose of granting degrees and governing the *studium*. But he was from the first elected by the masters, and early obtained recognition as the head of the university as well as the representative of the bishop. The *procuratores* (originally also *rectores*) remained representatives of the faculty of arts and (there being at Oxford no deans) of the whole university. But the feature which most served to give permanence and cohesion to the entire community was, as at Oxford, the institution of colleges. The earliest of these was Peterhouse, first founded as a separate

Cambridge.

institution by Hugh Balsham, bishop of Ely, in the year 1284, its earliest extant code being that given in 1344 by Simon de Montacute, which was little more than a transcript of that drawn up by Walter de Merton for his scholars at Oxford. In 1323 was founded Michaelhouse, and two years later, in 1326, Edward II. instituted his foundation of "king's scholars," afterwards forming the community of King's Hall. Both these societies in the 16th century were merged in Trinity College. To these succeeded Pembroke Hall (1347) and Gonville Hall (1348). All these colleges, although by no means conceived in a spirit of hostility to either the monastic or the mendicant orders, were expressly designed for the benefit of the secular clergy. The foundation of Trinity Hall (*Aula*)[1] in 1350 by Bishop Bateman, on the other hand, as a school of civil and canon law, was probably designed to further ultramontane interests. That of Corpus Christi (1352), the outcome of the liberality of a gild of Cambridge townsmen, was conceived with the combined object of providing a house of education for the clergy, and at the same time securing the regular performance of masses for the benefit of the souls of departed members of the gild. But both Trinity Hall and Corpus Christi College, as well as Clare Hall, founded in 1359, were to a great extent indebted for their origin to the ravages caused among the clergy by the great plague of 1349. In the latter half of the same century, the coming change of feeling is shown by the fact that the chancellor was under the necessity of issuing a decree (1374) in order to protect the house of the Carmelites from molestation on the part of the students.

Returning to France, or rather to the territory included within the boundaries of modern France, we find Montpellier a recognized school of medical science as early as the 12th century. William VIII., lord of Montpellier, in the year 1181 proclaimed it a school of free resort, where any teacher of medical science, from whatever country, might give instruction. Before the end of the century it possessed also a faculty of jurisprudence, a branch of learning for which it afterwards became famed. The university of medicine and that of law continued, however, to be totally distinct bodies with different constitutions. Petrarch was sent by his father to Montpellier to study the civil law. On 26th October 1289 Montpellier was raised by Nicholas IV. to the rank of a "studium generale," a mark of favour which, in a region where papal influence was so potent, resulted in a considerable accession of prosperity. The university also now included a faculty of arts; and there is satisfactory evidence of the existence of a faculty of theology before the close of the 14th century, although not formally recognized by the pope before the year 1421. In the course of the same century several colleges for poor students were also founded. The university of Toulouse is to be noted as the first founded in any country by virtue of a papal charter. It took its rise in the efforts of Rome for the suppression of the Albigensian heresy, and its foundation formed one of the articles of the conditions of peace imposed by Louis IX. on Count Raymond of Toulouse. In the year 1233 it first acquired its full privileges as a "studium generale" by virtue of a charter given by Gregory IX. This pontiff watched over the university with especial solicitude, and through his exertions it soon became noted as a centre of that Dominican teaching which involved the extermination of the Catharists. As a school of arts, jurisprudence and medicine, although faculties of each existed, it never attained to any reputation. The university of Orleans had a virtual existence as a studium generale as early as the first half of the 13th century, but in the year 1305 Clement V. endowed it with new privileges, and gave its teachers permission to form themselves into a corporation. The schools of the city had an existence long prior—as early, it is said, as the 6th century—and subsequently supplied the nucleus for the foundation of a university at Blois; but of this university no records are extant.[2]

Montpellier. ***Toulouse.*** ***Orleans.***

Orleans, in its organization, was modelled mainly on Paris, but its studies were complementary rather than in rivalry to the older university. The absorbing character of the study of the civil law, and the mercenary spirit in which it was pursued, had led the authorities at Paris to refuse to recognize it as a faculty. The study found a home at Orleans, where it was cultivated with an energy which attracted numerous students. In January 1235 we find the bishop of Orleans soliciting the advice of Gregory IX. as to the expediency of countenancing a study which was prohibited in Paris. Gregory decided that the lectures might be continued; but he ordered that no beneficed ecclesiastic should be allowed to devote himself to so eminently secular a branch of learning. Orleans subsequently incorporated a faculty of arts, but its reputation from this period was always that of a school of legal studies, and in the 14th century its reputation in this respect was surpassed by no other university in Europe. Prior to the 13th century it had been famed for its classical learning; and Angers, which received its charter at the same time, also once enjoyed a like reputation, which, in a similar manner, it exchanged for that of a school for civilians and canonists. The roll of the university forwarded in 1378 to Clement VII. contains the names of 8 professors *utriusque juris*, 2 of civil and 2 of canon law, 72 licentiates, 284 bachelors of both the legal faculties, and 190 scholars. The university of Avignon was first recognized as a "studium generale" by Boniface VIII. in the year 1303, with power to grant degrees in jurisprudence, arts and medicine. Its numbers declined somewhat during the residence of the popes, owing to the counter-attractions of the "studium" attached to the Curia; but after the return of the papal court to Rome it became one of the most frequented universities in France, and possessed at one time no less than seven colleges. The university of Cahors enjoyed the advantage of being regarded with especial favour by John XXII. In June 1332 he conferred upon it privileges identical with those already granted to the university of Toulouse. In the following October, again following the precedent established at Toulouse, he appointed the *scholasticus* of the cathedral chancellor of the university. In November of the same year a bull, couched in terms almost identical with those of the Magna Charta of Paris, assimilated the constitution of Cahors to that of the oldest university. The two schools in France which, down to the close of the 14th century, most closely resembled Paris were Orleans and Cahors. The civil immunities and privileges of the latter university were not, however, acquired until the year 1367, when Edward III. of England, in his capacity as duke of Aquitaine, not only exempted the scholars from the payment of all taxes and imposts, but bestowed upon them the peculiar privilege known as *privilegium fori*. Cahors also received a licence for faculties of theology and medicine, but, like Orleans, it was chiefly known as a school of jurisprudence. It was as a "studium generale" in the same three faculties that Grenoble, in the year 1339, received its charter from Benedict XII. The university never attained to much importance, and its annals are for the most part involved in obscurity. At the commencement of the 16th century it had ceased altogether to exist, was reorganized by Francis of Bourbon in 1542, and in 1565 was united to the university of Valence. The university of Perpignan, founded, according to Denifle, in 1379 by Clement VII. (although tradition had previously ascribed its origin to Pedro IV. of Aragon), and that of Orange, founded in 1365 by Charles IV., were universities only by name and constitution, their names rarely appearing in contemporary chronicles, while their very existence becomes at times a matter for reasonable doubt.

Angers. ***Avignon.*** ***Cahors.*** ***Grenoble.*** ***Perpignan.*** ***Orange.***

To some of the earlier Spanish universities—such as Palencia, founded about the year 1214 by Alphonso VIII.; Huesca, founded in 1354 by Pedro IV.; and Lerida, founded in 1300 by James II.—the same description is applicable; and their insignificance is probably indicated by the fact that they entirely failed to attract foreign students.

Palencia, Huesca, Lerida.

[1] *Aula* denoting the building which the "college" of scholars was to inhabit; the society continued to retain this designation in order to distinguish it from Trinity *College*, founded in 1546.

[2] See Ch. Desmaze, *L'Université de Paris* (1200–1875).

Valladolid, which received its charter from Pope Clement VI. in 1346, attained, however, to great celebrity; and the foreign teachers and students frequenting the university became so numerous that in 1373 King Enriquez II. caused an enactment to be passed for securing to them the same privileges as those already accorded to the native element. But the total number of the students in 1403 was only 116, and grammar and logic, along with jurisprudence (which was the principal study), constituted the sole curriculum. In 1418, however, at the council of Constance, Martin V. not only decreed that Valladolid should take rank as a *studium generale*, but also as a "universitas theologiae," and that the new faculty should possess the same privileges as those of the same faculty in Paris. From this time accordingly the advance of the university in numbers was steady and continuous throughout the 15th century, and, along with Salamanca, it served as the model for Alcalà in 1499. The university which rose on the banks of the Henares and became famous under the direction of the eminent Ximenes, was removed in 1623 to Madrid; and for the next century and a half the foremost place among the universities of Spain must be assigned to Salamanca, to which Seville, in the south, stood in the relation of a kind of subsidiary school, having been founded in 1254 by Alphonso the Wise, simply for the study of Latin and of the Semitic languages, especially Arabic. Salamanca had been founded in 1243 by Ferdinand III. of Castile as a studium generale in the three faculties of jurisprudence, the arts and medicine. The king also extended his special protection to the students, granting them numerous privileges and immunities. Under his son Alphonso (above named) the university acquired a further development, and eventually included all the faculties save that of theology. But the main stress of its activity, as was the case with all the earlier Spanish universities until the beginning of the 15th century, was laid on the civil and the canon law. The provision for the payment of its professors was, however, at first so inadequate and precarious that in 1298 they by common consent suspended their lectures, in consequence of their scanty remuneration. A permanent remedy for this difficulty was thereupon provided, by the appropriation of a certain portion of the ecclesiastical revenues of the diocese for the purpose of augmenting the professors' salaries, and the efforts of Martin V. established a school of theology which was afterwards regarded almost as an oracle by Catholic Europe. About the year 1600 the students are shown by the matriculation books to have numbered over 5000. According to Cervantes they were noted for their lawlessness. The earliest of the numerous colleges founded at Salamanca was that of St Bartholomew, long noted for its ancient library and valuable collection of manuscripts, which now form part of the royal library in Madrid.

Valladolid.

Alcalà.

Seville and Salamanca.

The one university possessed by Portugal had its seat in medieval times alternately in Lisbon and in Coimbra, until, in the year 1537, it was permanently attached to the latter city. Its formal foundation took place in 1309, when it received from King Diniz a charter, the provisions of which were mainly taken from those of the charter given to Salamanca. In 1772 the university was entirely reconstituted.

Coimbra.

Of the universities included in the present Austrian empire, Prague, which existed as a "studium" in the 13th century, was the earliest. It was at first frequented mainly by students from Styria and Austria, countries at that time ruled by the emperor Charles IV., who was also king of Bohemia, and at whose request Pope Clement VI., on the 26th of January 1347, promulgated a bull authorizing the foundation of a "studium generale" in all the faculties. In the following year Charles himself issued a charter for the foundation. This document, which, if original in character, would have been of much interest, has but few distinctive features of its own, its provisions being throughout adapted from those contained in the charters given by Frederick II. for the university of Naples and by Conrad for Salerno—almost the only important feature of difference being that Charles bestows on the students of Prague all the civil privileges and immunities which were enjoyed by the teachers of Paris and Bologna. Charles had himself been a student in Paris, and the organization of his new foundation was modelled on that university, a like division into four "nations" (although with different names) constituting one of the most marked features of imitation. The numerous students—and none of the medieval universities attracted in their earlier history a larger concourse—were drawn from a gradually widening area, which at length included, not only all parts of Germany, but also England, France, Lombardy, Hungary and Poland. Contemporary writers, with the exaggeration characteristic of medieval credulity, even speak of thirty thousand students as present in the university at one time—a statement for which Denifle proposes to substitute two thousand as a more probable estimate. It is certain, however, that Prague, prior to the foundation of Leipzig, was one of the most frequented centres of learning in Europe, and Paris suffered a considerable diminution in her numbers owing to the counter-attractions of the great *studium* of Slavonia.

Prague.

The university of Cracow in Poland was founded in May 1364, by virtue of a charter given by King Casimir the Great, who bestowed on it the same privileges as those possessed by the universities of Bologna and Padua. In the following September Urban V., in consideration of the remoteness of the city from other centres of education, constituted it a "studium generale" in all the faculties save that of theology. It is, however, doubtful whether these designs were carried into actual realization, for it is certain that, for a long time after the death of Casimir, there was no university whatever. Its real commencement must accordingly be considered to belong to the year 1400, when it was reconstituted, and the papal sanction was given for the incorporation of a faculty of theology. From this time its growth and prosperity were continuous; and with the year 1416 it had so far acquired a European reputation as to venture upon forwarding an expression of its views in connexion with the deliberations of the council of Constance. Towards the close of the 15th century the university is said to have been in high repute as a school of both astronomical and humanistic studies.

Cracow.

The Avignonese popes appear to have regarded the establishment of new faculties of theology with especial jealousy; and when, in 1364, Duke Rudolph IV. founded the university of Vienna, with the design of constituting it a "studium generale" in all the faculties, Urban V. refused his asssent to the foundation of a theological school. Owing to the sudden death of Duke Rudolph, the university languished for the next twenty years, but after the accession of Duke Albert III., who may be regarded as its real founder, it acquired additional privileges, and its prosperity became marked and continuous. Like Prague, Vienna was for a long time distinguished by the comparatively little attention bestowed by its teachers on the study of the civil law.

Vienna.

No country in the 14th century was looked upon with greater disfavour at Rome than Hungary. It was stigmatized as the land of heresy and schism. When, accordingly, in 1367 King Louis applied to Urban V. for his sanction of the scheme of founding a university at Fünfkirchen, Urban would not consent to the foundation of a faculty of theology, although theological learning was in special need of encouragement in those regions; the pontiff even made it a condition of his sanction for a studium generale that King Louis should first undertake to provide for the payment of the professors. We hear but little concerning the university after its foundation, and it is doubtful whether it survived for any length of time the close of the century. "The extreme east of civilized continental Europe in medieval times," observes Denifle, "can be compared, so far as university education is concerned, only with the extreme west and the extreme south. In Hungary, as in Portugal and in Naples, there was constant fluctuation, but the west and the south, although troubled by yet greater commotions than Hungary, bore better fruit. Among all the countries possessed of universities in medieval

Fünfkirchen.

times, Hungary occupies the lowest place—a state of affairs of which, however, the proximity of the Turk must be looked upon as a main cause."

The university of Heidelberg (the oldest of those of the German realm) received its charter (October 23, 1385) from Urban VI. as a "studium generale" in all the recognized faculties save that of the civil law—the form and substance of the document being almost identical with those of the charter granted to Vienna. It was granted at the request of the elector palatine, Rupert I., who conferred on the teachers and students, at the same time, the same civil privileges as those which belonged to the university of Paris. In this case the functionary invested with the power of bestowing degrees was non-resident, the licences being conferred by the provost of the cathedral at Worms. But the real founder, as he was also the organizer and teacher, of the university was Marsilius of Inghen, to whose ability and energy Heidelberg was indebted for no little of its early reputation and success. The omission of the civil law from the studies licensed in the original charter would seem to show that the pontiff's compliance with the elector's request was merely formal, and Heidelberg, like Cologne, included the civil law among its faculties almost from its first creation. No medieval university achieved a more rapid and permanent success. Regarded with favour alike by the civil and ecclesiastical potentates, its early annals were singularly free from crises like those which characterize the history of many of the medieval universities. The number of those admitted to degrees from the commencement of the first session (19th October 1386 to 16th December 1387) amounted to 579.[1]

Heidelberg.

Owing to the labours of the Dominicans, Cologne had gained a reputation as a seat of learning long before the founding of its university; and it was through the advocacy of some leading members of the Mendicant orders that, at the desire of the city council, its charter as a "studium generale" (21st May 1388) was obtained from Urban VI. It was organized on the model of the university of Paris, as a school of theology and canon law, and "any other recognized faculty"—the civil law being incorporated as a faculty soon after the promulgation of the charter. In common with the other early universities of Germany—Prague, Vienna and Heidelberg—Cologne owed nothing to imperial patronage, while it would appear to have been, from the first, the object of special favour with Rome. This circumstance serves to account for its distinctly ultramontane sympathies in medieval times and even far into the 16th century. In a report transmitted to Gregory XIII. in 1577, the university expressly derives both its first origin and its privileges from the Holy See, and professes to owe no allegiance save to the Roman pontiff.

Cologne.

Erfurt, no less noted as a centre of Franciscan than was Cologne of Dominican influence, received its charter (16th September 1379) from the anti-pope Clement VII. as a "studium generale" in all the faculties. Ten years later (4th May 1389) it was founded afresh by Urban VI., without any recognition of the act of his pretended predecessor. In the 15th century the number of its students was larger than that at any other German university—a fact attributable partly to the reputation it had acquired as a school of jurisprudence, and partly to the ardour with which the nominalist and realist controversies of the time were debated in its midst; its readiness in according a hearing to novel theories causing it to be known as *novorum omnium portus*.

Erfurt.

The collegiate system is to be noted as a feature common to all these early German universities; and, in nearly all, the professors were partly remunerated by the appropriation of certain prebends, appertaining to some neighbouring church, to their maintenance.

During the first half of the 15th century the relations of the Roman pontiffs to the universities continued much the same, although the independent attitude assumed by the deputies of those bodies at the great councils of Constance and Basel, and especially by those from Paris, could not fail to give rise to apprehensions. The papal bulls for each new foundation begin to indicate a certain jealousy with respect to the appropriation of prebends by the founders. Where such appropriations are recognized, and more particularly in France, a formal sanction of the transfer generally finds a place in the bull authorizing the foundation; but sometimes the founder or founders are themselves enjoined to provide the endowments requisite for the establishment and support of the university. In this manner the control of the pontiff over each newly created seat of learning assumed a more real character, from the fact that his assent was accompanied by conditions which rendered it no longer a mere formality. The imperial intervention, on the other hand, was rarely invoked in Germany—Greifswald, Freiburg and Tübingen being the only instances in which the emperor's confirmation of the foundation was solicited.[2] The inadequacy of the traditional studies to meet the growing wants of civilization, and the consequent lack of sympathy on the part of each civic population in which a new studium was founded, now become frequently apparent. Of such conditions the fortunes of the studium at Würzburg in Bavaria—founded in 1402 by a bishop, with a charter bestowed by Boniface IX.—illustrate the dangers. The students belonged chiefly to the faculties of law and theology, and the frequency of their conflicts with the citizens made it necessary before ten years had elapsed to close the university, which was not reopened until 1582. Under the patronage of the prince Bishop Julius Echter von Mespelbrunn, however, it soon became largely frequented by Catholic students. At the present time, under the patronage of the house of Wittelsbach, it is widely famed as a school of medicine.

Relations of the popes to the universities.

Würzburg.

In Turin the university founded in 1412 by the counts of Savoy had to be refounded in 1431. The efforts of Parma in the 14th century to raise itself by papal aid to the dignity of a university proved altogether abortive, and it was not until 1422 that, under the protection of the dukes of Milan, its object was attained. In Sicily, Catania, the earliest of its high schools, was created a university by Alphonso of Aragon in 1445. Five years later Barcelona received from Pope Nicholas V. the same privileges as Toulouse had obtained from Gregory IX. Among the Spanish universities, however, none has had a more chequered history, although now taking rank with foremost.

Catania.

Barcelona.

In Hungary, Mathias Corvinus obtained from Paul II. in 1465 permission to found a general studium where he thought best within his realms—a latitude of choice conceded probably in consequence of the dangers which menaced the kingdom alike from Bohemia and from the Turks; while the fact that the university at Ofen (Hungarian *Buda*) was not actually founded until some ten years later, may have been owing to the resolute stand made by the youthful monarch against the claims to nominate bishops put forward not only by Pope Paul but by his successor Sixtus IV. (1471–84). After a series of eventful experiences, the university of Budapest remains, at the present time, almost exclusively Magyar. It has a school of law at Pressburg, which is all that remains of the university there founded by Mathias Corvinus in 1465.

Budapest.

In northern Germany and in the Netherlands, on the other hand, the growing wealth and prosperity of the different states especially favoured the formation of new centres of learning. In the flourishing duchy of Brabant the university of Louvain (1426) was to a great extent controlled by the municipality; and their patronage, although ultimately attended with detrimental results, long enabled Louvain to outbid all the other universities of Europe in the munificence with which she rewarded her professors. In the course of the next century the "Belgian Athens," as she is styled by Lipsius, ranked second only to Paris in numbers and reputation. In its numerous separate foundations and general

Foundation of Louvain.

organization—it possessed no less than twenty-eight colleges —it closely resembled the English universities; while its active press afforded facilities to the author and the controversialist of which both Cambridge and Oxford were at that time almost destitute. It embraced all the faculties, and no degrees in Europe stood so high as guarantees of general acquirements. Erasmus records it as a common saying, that "no one could graduate at Louvain without knowledge, manners and age." Sir William Hamilton speaks of the examination at Louvain for a degree in arts as "the best example upon record of the true mode of such examination, and, until recent times, in fact, the only example in the history of universities worthy of consideration at all." He has translated from Vernulaeus the order and method of this examination.[1] In 1788 the faculties of jurisprudence, medicine and philosophy were removed to Brussels, and in 1797 the French suspended the university altogether.

In Germany the conditions under which the new centres were created reflect and illustrate the history of the country in a remarkable manner. *Leipzig.* Those connected with the rise of the university of Leipzig are especially noteworthy, it having been the result of the migration of almost the entire German element from the university of Prague. This element comprised (1) Bavarians, (2) Saxons, (3) Poles (this last-named division being drawn from a wide area, which included Meissen, Lusatia, Silesia and Prussia), and, being represented by three votes in the assemblies of the university, while the Bohemians possessed but one, had acquired a preponderance in the direction of affairs which the latter could no longer submit to. Religious differences, again, evoked mainly by the preaching of John Huss, further intensified the existing disagreements; and eventually, in the year 1409, King Wenceslaus, at the prayer of his Bohemian subjects, issued a decree which exactly reversed the previous distribution of votes,—three votes being assigned to the Bohemian nation and only one to all the rest. The Germans took deep umbrage, and seceded to Leipzig, where, a bull having been obtained from Alexander V. (September 9, 1409), a new "studium generale" was founded by the landgrave of Thuringia and the margraves of Meissen. The members were divided into four nations—composed of natives of Meissen, Saxony, Bavaria and Poland. Two colleges were founded, a greater and a smaller, but designed, not for poor students, but for masters of arts—twelve being admitted on the former and eight on the latter foundation.

At Rostock, in the north, the dukes John and Albert of Mecklenburg conceived the design of founding a university from which the faculty of theology should be excluded. *Rostock.* Pope Martin V., to whom they applied for his sanction, was scarcely in a position to refuse it, absorbed as he was with the pacification of Italy, the consolidation of his own temporal power, and the restoration of his almost ruinous capital. The university was accordingly founded as proposed in 1419; but in 1431 Eugenius IV. instituted a faculty of theology, and two colleges were founded with the same design and on the same scale as at Leipzig. Six years later the whole academic community having incurred the papal ban was fain to migrate to Greifswald, returning, however, to Rostock in 1443, but with one important exception, that of a master of arts named Henry Rubenow, who remained to become burgomaster of the former city, and succeeded in persuading Duke Wratislaw of Pommern to make it the seat of a university. Calixtus III. granted a bull in 1456, but it was stipulated that the rector should be a bishop, and the professorial chairs were also made partially dependent for endowment on canonries. *Greifswald.* Greifswald thus became exposed to the full brunt of the struggle which had ensued when the endeavour to nationalize the German church was terminated by the Concordat of Vienna (1448). Of its original statutes only those of the arts faculty are extant.

The universities of Freiburg in Baden and Tübingen in Württemberg, on the other hand, reflect the sympathies of the Catholic party under the Austrian rule. *Freiburg.* They alike owed their foundation to the countess Matilda, by whose persuasion her husband, the archduke of Austria, known as Albrecht VI., was induced to found Freiburg in 1455, and Count Eberhard (her son by a former marriage) to found Tübingen in 1477. The first session at Freiburg opened auspiciously in 1460 under the supervision of its rector, Matthew Hummel of Villingen, an accomplished and learned man, and its numbers were soon largely augmented by migrations of students from Vienna and from Heidelberg, while its resources, which originally were chiefly an annual grant from the city council, were increased by the bestowal of canonries and prebends in the neighbouring parishes. Erasmus had made Freiburg his residence from 1529 to 1535, during which time he may have originated a tradition of liberal learning, but in 1620, under the rule of the archduke Maximilian, the control of the Humanistic studies and of the entire faculty of philosophy was handed over to the Jesuits, who also gained possession of two of the chairs of theology. Although Strassburg since 1872 has been able to offer considerable counter-attractions, Freiburg has held her own, and numbers over 1600 students. The university of Tübingen was founded in 1477 with four faculties —those of theology, law, medicine and the arts—and numbered scholars such as John Reuchlin and Melanchthon *Tübingen.* among its teachers; while in the last century it was famous both for its school of medicine and that of theology (see TÜBINGEN). Its general condition in the year 1541–1542, and the sources whence its revenues were derived, have been illustrated by Hoffmann in a short paper which shows the fluctuating nature of the resources of a university in the 16th century—liable to be affected as they were both by the seasons and the markets.[2]

The earliest 15th-century university in France was that of Aix in Provence. It had originally been nothing more than a school of theology and law, but in 1409 it was re-organized under the direction of the local count as a *Aix in Provence.* studium generale on the model of Paris. The sphere of its activity is indicated by the fact that the students were divided into Burgundians, Provençals and Catalans. The next foundation, that of Poitiers, had a wider significance as *Poitiers.* illustrating the struggle that was going on between the French crown and the Roman see. It was instituted by Charles VII. in 1431, almost immediately after his accession, with the special design of creating a centre of learning less favourable to English interests than Paris had at that time shown herself to be. Eugenius IV. could not refuse his sanction to the scheme, but he endeavoured partially to defeat Charles's design by conferring on the new "studium generale" simply the same privileges as those possessed by Toulouse, and thus placing it at a disadvantage in comparison with Paris. Charles rejoined by an extraordinary exercise of his own prerogative, conferring on Poitiers all the privileges collectively possessed by Paris, Toulouse, Montpellier, Angers and Orleans, and at the same time placing the university under special royal protection. The foundation of the university of Caen, in the diocese of Bayeux, was attended by conditions almost exactly the reverse of those which belonged to the *Caen.* foundation of that at Poitiers. It was founded under English auspices during the short period of the supremacy of the English arms in Normandy in the 15th century. Its charter (May 1437) was given by Eugenius IV., and the bishop of Bayeux was appointed its chancellor. The university of Paris had by this time completely forfeited the favour of Eugenius by its attitude at the council of Basel, and Eugenius inserted in the charter for Caen a clause of an entirely novel character, requiring all those admitted to degrees to take an oath of fidelity to the see of Rome, and to bind themselves to attempt nothing prejudicial to her interests. To this proviso the famous Pragmatic Sanction of Bourges was Charles's rejoinder in the following year. On the 18th of May 1442 we find King Henry VI. writing to Eugenius, and dwelling with satisfaction on the rapid progress of the new university, to which, he says, students had flocked from all quarters, and were still daily

[1] *Dissertations and Discussions*, Append. iii.

[2] *Ökonomischer Zustand der Universität Tübingen gegen die Mitte des 16ten Jahrhunderts* (1845).

arriving.[1] Ten years later, when the English had been expelled, its charter was given afresh by Charles in terms which left the original charter unrecognized; both teachers and learners were subject to the civil authorities of the city, and all privileges made previously conferred in cases of legal disputes were abolished. From this time the university of Caen was distinguished by its loyal spirit and firm resistance to ultramontane pretensions; and, although swept away at the French Revolution, it was afterwards restored, owing to the sense of the services it had thus once rendered to the national cause.[2] No especially notable circumstances characterize the foundation of the university of Bordeaux (1441) or that of Valence (1452), but that of Nantes, which received its charter from Pius II. in 1463, is distinguished by the fact that it did not receive the ratification of the king of France, and the conditions under which its earlier traditions were formed thus closely resemble those of Poitiers. It seems also to have been regarded with particular favour by Pius II., a pontiff who was at once a ripe scholar and a writer upon education. He gave to Nantes a notable body of privileges, which not only represent an embodiment of all the various privileges granted to universities prior to that date, but afterwards became, with their copious and somewhat tautological phraseology, the accepted model for the great majority of university charters, whether issued by the pope or by the emperor, or by the civil authority. The bishop of Nantes was appointed head of the university, and was charged with the special protection of its privileges against all interference from whatever quarter.[3] The bull for the foundation of the university of Bourges was given in 1465 by Paul II. at the request of Louis XI. and his brother. It confers on the community the same privileges as those enjoyed by the other universities of France. The royal sanction was given at the petition of the citizens; but, from reasons which do not appear, they deemed it necessary further to petition that their charter might also be registered and enrolled by the parlement of Paris.

Bordeaux, Valence, Nantes.

Bourges.

Founded about the same time, and probably in a spirit of direct rivalry to Freiburg, the university of Basel was opened in 1460 under the auspices of its own citizens. The cathedral school in that ancient city, together with others attached to the monasteries, afforded a sufficient nucleus for a studium, and Pius II., who, as Aeneas Sylvius, had been a resident in the city, was easily prevailed upon to grant the charter (November 12, 1459). During the first seventy years of its existence the university prospered, and its chairs were held by eminent professors, among them historical scholars, such as Sebastian Brant and Jacob Wimpheling. But with the Reformation, Basel became the arena of contests which menaced the very existence of the university itself, the professors being, for the most part, opposed to the new movement with which the burghers warmly sympathized. Eventually, the statutes were revised, and in the latter half of the 16th century the university may be said to have attained its apogee. Before he had signed the bull for the foundation of the university of Basel, Pope Pius, at the request of Duke William of Bavaria, had issued another bull for the foundation of a university at Ingolstadt (7th April 1459). But it was not until 1472 that the work of teaching was actually commenced there. Some long-existing prebends, founded by former dukes of Bavaria, were appropriated to the endowment, and the chairs in the different faculties were distributed as follows: theology 2, jurisprudence 3, medicine 1, arts 6—arts in conjunction with theology thus obtaining the preponderance. As at Caen, twenty-two years before, an oath of fidelity to the Roman pontiff was imposed on every student admitted to a degree.[4] That this proviso was not subsequently abolished, as at Caen, is a feature in the history of the university of Ingolstadt which was attended by important results. Nowhere did the Reformation meet with more stubborn resistance, and it was at Ingolstadt that the Counter-Reformation was commenced. In 1556 the Jesuits made their first settlement in the university.

Basel.

Ingolstadt.

The next two universities took their rise in the archiepiscopal seats of Treves and Mainz. That at Treves received its charter as early as 1450; but the first academical session did not commence until 1473. Here the ecclesiastical influences appear to have been unfavourable to the project. The archbishop demanded 2000 florins as the price of his sanction. The cathedral chapter threw difficulties in the way of the appropriation of certain livings and canonries to the university endowment; and so obstinate was their resistance that in 1655 they succeeded in altogether rescinding the gift on payment of a very inadequate sum. It was not until 1722 that the assembly of deputies, by a formal grant, relieved the university from the difficulties in which it had become involved. The university of Mainz, on the other hand, was almost entirely indebted to the archbishop Diether for its foundation. It was at his petition that Sixtus IV. granted the charter, 23rd November 1476; and Diether, being himself an enthusiastic humanist, thereupon circulated a letter, couched in elegant Latinity, addressed to students throughout his diocese, inviting them to repair to the new centre, and dilating on the advantages of academic studies and of learning. The rise of these two universities, however, neither of which attained to much distinction, represents little more than the incorporation of certain already existing institutions into a homogeneous whole, the power of conferring degrees being superadded.

Treves.

Mainz.

Nearly contemporaneous with these foundations were those of Upsala (1477) and Copenhagen (1479), which, although lying without the political boundaries of Germany, reflected her influence. The charter for Copenhagen was given by Sixtus IV. as early as 1475. The students attracted to this new centre were mainly from within the radius of the university of Cologne, and its statutes were little more than a transcript of those of the latter foundation.

Upsala and Copenhagen.

The electorates of Wittenberg and Brandenburg were now the only two considerable German territories which did not possess a "studium generale," and the university founded at Wittenberg by Maximilian I. (6th July 1502) is notable as the first established in Germany by virtue of an imperial as distinguished from a papal decree. Its charter is, however, drawn up with the traditional phraseology of the pontifical bulls, and is evidently not conceived in any spirit of antagonism to Rome. Wittenberg is constituted a "studium generale" in all the four faculties—the right to confer degrees in theology and canon law having been sanctioned by the papal legate some months before, on the 2nd of February 1502. The endowment of the university with church revenues duly received the papal sanction—a bull of Alexander VI. authorizing the appropriation of twelve canonries attached to the castle church, as well as of eleven prebends in outlying districts—*ut sic per omnem modum unum corpus ex studio et collegio praedictis fiat et constituatur*. No university in Germany attracted to itself a larger share of the attention of Europe at its commencement. And it was its distinguishing merit that it was the first academic centre north of the Alps where the antiquated methods and barbarous Latinity of the scholastic era were overthrown. The last university founded in Germany prior to the Reformation was that of Frankfort-on-the-Oder. The design, first conceived by the elector John of Brandenburg, was carried into execution by his son Joachim, at whose request Pope Julius II. issued a bull for the foundation, 15th March 1506. An imperial charter, identical in its contents with the papal bull, followed on the 26th of October. The university received an endowment of canonries and livings similar to that of Wittenberg, and some houses in the city were assigned for its use by the elector.

[4] Paulsen, in speaking of this proviso as one "die weder vorher noch nachher sonst vorkommt," would consequently seem to be not quite accurate. See *Die Gründung der deutschen Universitäten*, p. 277.

The first university in Scotland was that of St Andrews, founded in 1411 by Henry Wardlaw, bishop of that see, and modelled chiefly on the constitution of the university of Paris. It acquired all its three colleges—St Salvator's, St Leonard's and St Mary's—before the Reformation—the first having been founded in 1456 by Bishop James Kennedy; the second in 1512 by the youthful Archbishop Alexander Stuart (natural son of James IV.), and John Hepburn, the prior of the monastery of St Andrews; and the third, also in 1512, by the Beatons, who in the year 1537 procured a bull from Pope Paul III. dedicating the college to the Blessed Virgin Mary of the Assumption, and adding further endowments. The most ancient of the universities of Scotland, with its three colleges, was thus reared in an atmosphere of medieval theology, and undoubtedly designed as a bulwark against heresy and schism. But "by a strange irony of fate," it has been observed, "two of these colleges became, almost from the first, the foremost agents in working the overthrow of that church which they were founded to defend." St Leonard's more especially, like St John's or Queens' at Cambridge, became a noted centre of intellectual life and Reformation principles. That he "had drunk at St Leonard's well" became a current expression for implying that a theologian had imbibed the doctrines of Protestantism.

St Andrews.

Glasgow.

The university of Glasgow was founded as a "studium generale" in 1453, and possessed two colleges. Prior to the Reformation it acquired but little celebrity; its discipline was lax, and the number of the students but small, while the instruction was not only inefficient but irregularly given; no funds were provided for the maintenance of regular lectures in the higher faculties; and there was no adequate executive power for the maintenance of discipline. The university of Aberdeen, which was founded in 1494, at first possessed only one college, namely, King's, which was coextensive with the university and conferred degrees. Marischal College, founded in 1593 by George Keith, fifth Earl Marischal, was constituted by its founder independent of the university in Old Aberdeen, being itself also a college and a university, with the power of conferring degrees. Bishop Elphinstone, the founder both of the university and of King's College (1505), had been educated at Glasgow, and had subsequently both studied and taught at Paris and at Orleans. To the wider experience which he had thus gained we may probably attribute the fact that the constitution of the university of Aberdeen was free from the glaring defects which then characterized that of the university of Glasgow.[1] But in all the medieval universities of Germany, England and Scotland, modelled as they were on a common type, the absence of adequate discipline was, in a greater or less degree, a common defect. In connexion with this feature we may note the comparatively small percentage of matriculated students proceeding to the degree of B.A. and M.A. when compared with later times. Of this disparity the table on next column, exhibiting the relative numbers in the university of Leipzig for every ten years from the year 1427 to 1552, probably affords a fair average illustration—the remarkable fluctuations probably depending quite as much upon the comparative healthiness of the period (in respect of freedom from epidemic) and the abundance of the harvests as upon any other cause.

Aberdeen.

Degrees taken at Leipzig.

The German universities in these times seem to have admitted for the most part their inferiority in learning to older and more favoured centres; and their consciousness of the fact is shown by the efforts which they made to attract instructors from Italy, and by the frequent resort of the more ambitious students to schools like Paris, Bologna, Padua and Pavia. That they took their rise in any spirit of systematic opposition to the Roman see (as Meiners and others have contended), or that their organization was something external to and independent of the church, is an assertion somewhat qualified by the foregoing evidence. Generally speaking, they were eminently conservative bodies,

General aspects of German medieval universities.

and the new learning of the humanists and the new methods of instruction that now began to demand attention were alike for a long period unable to gain admission within academic circles. Reformers such as Hegius, John Wessel and Rudolphus Agricola carried on their work at places like Deventer remote from university influences. That there was a considerable amount of mental activity going on in the universities themselves is not to be denied; but it was mostly of that unprofitable kind which, while giving rise to endless controversy, turned upon questions in connexion with which the implied postulates and the terminology employed rendered all scientific investigation hopeless. At almost every university—Leipzig, Greifswald and Prague (after 1409) being the principal exceptions—the so-called Realists and Nominalists represented two great parties occupied with an internecine struggle. At Paris, owing to the overwhelming strength of the theologians, the Nominalists were indeed under a kind of ban; but at Heidelberg they had altogether expelled their antagonists. It was much the same at Vienna and at Erfurt —the latter, from the ready reception which it gave to new speculation, being styled by its enemies "novorum omnium portus." At Basel, under the leadership of the eminent Johannes a Lapide, the Realists with difficulty maintained their ground. Freiburg, Tübingen and Ingolstadt, in the hope of diminishing controversy, arrived at a kind of compromise, each party having its own professor, and representing a distinct "nation." At Mainz the authorities adopted a manual of logic which was essentially an embodiment of Nominalistic principles.

In Italy, almost without exception, it was decided that these controversies were endless and that their effects were pernicious. It was resolved, accordingly, to expel logic, and allow its place to be filled by rhetoric. It was by virtue of this decision, which was of a tacit rather than a formal character, that the expounders of the new learning in the 15th century—men like Emmanuel Chrysoloras, Guarino, Leonardo Bruni, Bessarion, Argyropulos and Valla—carried into effect that important revolution in academic studies which constitutes a new era in university learning, and largely helped to pave the way for the Reformation.[2] This discouragement of the controversial spirit, continued as it was in relation to theological questions after the Reformation, obtained for the Italian universities a fortunate immunity from dissensions like those which, as we shall shortly see, distracted the centres of learning in Germany. The professorial body also attained to an almost unrivalled reputation. It was exceptionally select, only those who were in receipt of salaries being permitted, as a rule, to lecture; it was also famed for its ability, the institution of concurrent chairs proving an excellent stimulus. These chairs were of two kinds—"ordinary" and "extraordinary"—the former being the more liberally endowed and fewer in number. For each subject of importance there were thus always two and sometimes three rival chairs, and a powerful and continuous emulation was thus maintained among the teachers. "From

Abandonment of logical studies in Italy.

High reputation of Italian professors.

[2] For an excellent account of this movement, see Georg Voigt, *Die Wiederbelebung des classischen Alterthums* (2nd ed., 2 vols., 1880).

the integrity of their patrons, and the lofty standard by which they were judged," says Sir W. Hamilton, "the call to a Paduan or Pisan chair was deemed the highest of all literary honours. The status of professor was in Italy elevated to a dignity which in other countries it has never reached; and not a few of the most illustrious teachers in the Italian seminaries were of the proudest nobility of the land. While the universities of other countries had fallen from Christian and cosmopolite to sectarian and local schools, it is the peculiar glory of the Italian that, under the enlightened liberality of their patrons, they still continued to assert their European universality. Creed and country were in them no bar—the latter not even a reason of preference. Foreigners of every nation are to be found among their professors; and the most learned man in Scotland, Thomas Dempster, sought in a Pisan chair that theatre for his abilities which he could not find at home."[1]

To such catholicity of sentiment the Spanish universities during the same period offer a complete contrast, their history being so strongly modified by political and religious movements that some reference to these becomes indispensable. **Valencia.** Valencia, founded in 1501 as a school not only of theology and of civil and canon law, but also of the arts and of medicine, and sanctioned at the petition of its council by Alexander VI. (see Denifle, i. 645–46), and Seville, sanctioned by **Seville.** Julius II. in 1505, appear both to have been regarded without mistrust at Rome. But although the latter pontiff had approved the foundation of the university of Santiago as early as 1504, the bull for its creation was not granted by Clement VII. until 1526. While, again, the design of establishing a university at Granada had been approved by Charles V. in the **Granada.** same year, it was not until 1531 that Clement gave his consent, and even then the work of preparation was deferred for another six years. Little indeed is to be learnt respecting the new society until the foundation of the liberally endowed College de Sacro Monte by the archbishop of the province in 1605. These delays are partly to be accounted for by the well-known political jealousies that existed between the monarch and the pontiff; but it is also to be noted that at precisely the same period a movement of no slight importance, whereby it was sought to gain the recognition by the church of the writings and teaching of Erasmus, had been going on in the universities of Spain, and had ultimately died out. It died out at the uncreating voice of the Dominican Melchior Cano, who revived the ancient scholasticism and the teaching of Aquinas. Then followed the Jesuits, whom Cano himself had once denounced as "precursors of Antichrist," and under their direction the scholastic philosophy, together with a certain attention to Greek and Hebrew, became the dominant study. And when the council of Trent had done its work, and doctrinal controversy seemed to have been finally laid to rest, Gregory XIII. in 1574 authorized the foundation of the university of Oviedo; but this was **Oviedo.** not opened until 1608, and then only with a faculty of law. After this time the universities in Spain shared in the general decline of the country; and even after the expulsion of the Jesuits in 1769 no marked improvement is discernible in their schools. On the contrary, the departure of a body of very able instructors, who, whatever objections might be taken to their doctrinal teaching, were mostly good scholars and men in close touch with the outer world, distinctly favoured that tendency to lifeless routine and unreasoning tradition which characterizes the Spanish universities until the second half of the 19th century.

The comparative unimportance of the universities founded during the same period in Italy is partially explained by the **Italian universities.** number of those which previously existed. In the papal states Macerata and Camerino were founded at a wide interval; the former, according to tradition, **Macerata.** by a bull of Nicholas IV. as early as the 13th century, **Camerino.** the latter not until the year 1727 by a bull of Benedict XIII. Macerata, however, ceased to exist as a university in the last century, retaining only a faculty of law, but contributing to the maintenance of the medical faculty at Camerino, which was constituted one of the newly created "free universities" (along with Urbino, Ferrara and Perugia) in 1890, but continued to exist only with the aid of contributions levied on the local parishes. **Urbino.** Urbino, originally opened as a studium under papal patronage in 1671, was also constituted a free university; its chief study being that of law. At Modena there had long existed a faculty of the **Modena.** same study which enjoyed a high repute, but it was not until 1683 that it received its charter from Duke Francis II. of Este as the university of his capital. Like Camerino, Modena had to rely chiefly on funds collected in the commune, but was able nevertheless to acquire some reputation as a school of law and medicine, declining, when the Jesuits were installed by the Austrian authorities, to revive again in the general recovery which took place among the seats of learning after the unification of Italy. In Sicily, Palermo (1779) originated **Sicily. Palermo.** in an earlier institution composed mainly of subjects of Ferdinand IV., who had followed him on his expulsion from the throne of the Two Sicilies at Naples towards the end of the 18th century. It was closed in 1805, but reopened in 1850 to become a school of considerable importance in all the faculties with over 1000 students. The two universities of Sardinia—Sassari (1634) and Cagliari (1596)— **Sassari. Cagliari.** were founded under the Spanish rule, and both died out when that rule was exchanged for that of Austria. Under the auspices of the house of Savoy they were re-established, but neither can be said to have since achieved any marked success.

For the most part, however, the Reformation represents the great boundary line in the history of the medieval universities, and long after Luther and Calvin had passed away was still the main influence in the history of those new foundations which arose in Protestant countries. Even in Catholic countries its secondary effects were scarcely less perceptible, as they found expression in connexion with the Counter-Reformation. In Germany the Thirty Years' War was attended by consequences which were felt long after the 17th century. In France the Revolution of 1789 resulted in the actual uprooting of the university system.

The influence of the Humanists, and the special character which it assumed as it made its way in Germany in connexion with the labours of scholars like Erasmus, John Reuchlin and Melanchthon, augured well for the future. It was free from the frivolities, the pedantry, the immoralities and the scepticism which characterized so large a proportion of the corresponding culture in Italy. It gave promise of resulting at once in a critical and enlightened study of the masterpieces of classical antiquity, and in a reverent and yet rational interpretation of the Scriptures and the Fathers. **Pernicious influences of sectarianism.** The fierce bigotry and the ceaseless controversies evoked by the promulgation of Lutheran or Calvinistic doctrine dispelled, however, this hopeful prospect, and converted what might otherwise have become the tranquil abodes of the Muses into gloomy fortresses of sectarianism. Of the manner in which it affected the highest culture, the observation of Henke in his *Life of Calixtus* (i. 8), that for a century after the Reformation the history of Lutheran theology becomes almost identified with that of the German universities, may serve as an illustration.

The first Protestant university was that of Marburg, founded by Philip the Magnanimous, landgrave of Hesse, 30th May 1527. Expressly designed as a bulwark of Lutheranism, it **Marburg.** was mainly built up out of the confiscation of the property of the religious orders in the Hessian capital. The house of the Dominicans, who had fled on the first rumour of spoliation, was converted into lecture-rooms for the faculty of jurisprudence. The church and convent of the order known as the "Kugelherrn" was appropriated to the theological faculty. The friary of the Barefooted Friars was shared between the faculties of medicine and philosophy. The university, which was the object of the landgrave's peculiar care, rapidly rose to celebrity; it was resorted to by students from remote

[1] Hamilton, *Discussions*, 2nd ed. p. 373.

countries, even from Greece, and its professors were of distinguished ability. How much, however, of this popularity depended on its theological associations is to be seen in the fact that after the year 1605, when, by the decree of Count Maurice, its formulary of faith was changed from Lutheran to Calvinistic, its numbers greatly declined. This dictation of the temporal power now becomes one of the most notable features in academic history in Protestant Germany. The universities, having repudiated the papal authority, while that of the episcopal order was at an end, now began to pay especial court to the temporal ruler, and sought in every way to conciliate his goodwill, representing with peculiar distinctness the theory—*cujus regio, ejus religio.* This tendency was further strengthened by the fact that their colleges, bursaries and other similar foundations were no longer derived from or supported by ecclesiastical institutions, but were mainly dependent on the civil power.

Königsberg. The Lutheran university of Königsberg was founded 17th August 1544 by Albert III., margrave of Brandenburg, and the first duke of Prussia, and his wife Dorothea, a Danish princess. In this instance, the religious character of the foundation not having been determined at the commencement, the papal and the imperial sanction were both applied for, although not accorded. King Sigismund of Poland, however, which kingdom exercised at that time a protectorate over the Prussian duchy, ultimately gave the necessary charter (29th September 1561), at the same time ordaining that all students who graduated as masters in the faculty of philosophy should rank as nobles of the Polish kingdom. When Prussia was raised to the rank of a kingdom (1701) the university was made a royal foundation, and the "collegium Fridericianum," which was then erected, received corresponding privileges. In 1862 the university buildings were rebuilt, and the number of the students soon after rose to nearly a thousand.

Jena. The Lutheran university of Jena had its origin in a gymnasium founded by John Frederick the Magnanimous, elector of Saxony, during his imprisonment, for the express purpose of promoting Evangelical doctrines and repairing the loss of Wittenberg, where the Philippists had gained the ascendancy. Its charter, which the emperor Charles V. had refused to grant, and which was obtained with some difficulty from his brother, Ferdinand I., enabled the authorities to open the university on the 2nd of February 1558. Distinguished for its vehement assertion of Lutheran doctrine, its hostility to the teaching of Wittenberg was hardly less pronounced than that with which both centres regard Roman Catholicism. For a long time it was chiefly noted as a school of medicine, and in the 17th and 18th centuries was in bad repute for the lawlessness of its students, among whom duelling prevailed to a scandalous extent. The beauty of its situation and the eminence of its professoriate have, however, generally attracted a considerable proportion of students from other countries. Its numbers in 1906 were 1281.

Helmstedt. The Lutheran university of Helmstedt, founded by Duke Julius (of the house of Brunswick-Wolfenbüttel), and designated after him in its official records as "Academia Julia," received its charter, 8th May 1575, from the emperor Maximilian II. No university in the 16th century commenced under more favourable auspices. It was munificently endowed by the founder and by his son; and its "Convictorium," or college for poor students, expended in the course of thirty years no less than 100,000 thalers, an extraordinary expenditure for an institution of such a character in those days. Beautifully and conveniently situated in what had now become the well-peopled region between the Weser and the lower Elbe, and distinguished by its comparatively temperate maintenance of the Lutheran tenets, it attracted a considerable concourse of students, especially from the upper classes, not a few being of princely rank. Throughout its history, until suppressed in 1809, Helmstedt enjoyed the special and powerful patronage of the dukes of Saxony.

Altdorf. The "Gymnasium Aegidianum" of Nuremberg, founded in 1526, and removed in 1575 to Altdorf, represents the origin of the university of Altdorf. A charter was granted in 1578 by the emperor Rudolph II., and the university was formally opened in 1580. It was at first, however, empowered only to grant degrees in arts; but in 1623 the emperor Ferdinand II. added the permission to create doctors of law and medicine, and also to confer crowns on poets; and in 1697 its faculties were completed by the permission given by the emperor Leopold I. to create doctors of theology. Like Louvain, Altdorf was nominally ruled by the municipality, but in the latter university this power of control remained practically inoperative, and the consequent freedom enjoyed by the community from evils like those which brought about the decline of Louvain is thus described by Hamilton: "The decline of that great and wealthy seminary (Louvain) was mainly determined by its vicious patronage, both as vested in the university and in the town. Altdorf, on the other hand, was about the poorest university in Germany, and long one of the most eminent. Its whole endowment never rose above £800 a year; and, till the period of its declension, the professors of Altdorf make at least as distinguished a figure in the history of philosophy as those of all the eight universities of the British empire together. On looking closely into its constitution the anomaly is at once solved. The patrician senate of Nuremberg were too intelligent and patriotic to attempt the exercise of such a function. The nomination of professors, though formally ratified by the senate, was virtually made by a board of four curators; and what is worthy of remark, as long as curatorial patronage was a singularity in Germany, Altdorf maintained its relative pre-eminence, losing it only when a similar mean was adopted in the more favoured universities of the empire."[1]

Giessen. The conversion of Marburg into a school of Calvinistic doctrine gave occasion to the foundation of the universities of Giessen and of Rinteln. Of these the former, founded by the margrave of Hesse-Darmstadt, Louis V., as a kind of refuge for the Lutheran professors from Marburg, received its charter from the emperor Rudolph II. (19th May 1607). When, however, the margraves of Darmstadt acquired possession of Marburg in 1625, the university was transferred thither; in 1650 it was moved back again to Giessen. The number of matriculated students, which at the beginning of last century was about 250, had risen before its close to over 800. In common with the other universities of Germany, but with a facility which obtained for it a specially unenviable reputation, Giessen was for a long time wont to confer the degree of doctor *in absentia* in the different faculties without requiring adequate credentials. This practice drew forth an emphatic protest from the eminent historian Mommsen, and was abandoned long before his death. ***Rinteln.*** The university of Rinteln was founded 17th July 1621 by the emperor Ferdinand II. Almost immediately after its foundation it became the prey of contending parties in the Thirty Years' War, and its early development was thus materially hindered. It never, however, attained to much distinction, and in 1819 it was suppressed. ***Strassburg.*** The university of Strassburg was founded in 1621 on the basis of an already existing academy, to which the celebrated John Sturm stood, during the latter part of his life, in the relation of "rector perpetuus" and of which we are told that in 1578 it included more than a thousand scholars, among whom were 200 of the nobility, 24 counts and barons and three princes. It also attracted students from all parts of Europe, and especially from Portugal, Poland, Denmark, France and England. The method of Sturm's teaching became the basis of that of the Jesuits, and through them of the public school instruction in England. In 1621 Ferdinand II. conferred on this academy full privileges as a university; in the language of the charter, "in omnibus facultatibus, doctores, licentiatos, magistros, et baccalaureos, atque insuper *poetas laureatos* creandi et promovendi."[2] In 1681

[1] *Discussions*, &c., 2nd ed., pp. 388–89.
[2] *Promulg. Acad. Privil.*, &c. (Strassburg, 1628).

Strassburg became French, and remained so until 1872, when it was refounded by the Emperor William I., and before the close of the century numbered over 1100 students.

Moscow. Wilna. Dorpat. At the beginning of last century Russia possessed but three universities—that of Moscow (1755), founded by the Empress Elizabeth; of Wilna (1578), which was Polish and chiefly in the hands of the Jesuits; and of Dorpat [Yuriev] in Livonia, which was virtually German. *Charkow. Kasan. St Petersburg.* Under the enlightened policy of Alexander I. was founded the university of Charkow (1804) for New Russia, that of Kazan (1804) for the countries about the Volga, but designed also for the populations of Finland and Siberia, and that of St Petersburg (1819). Each of the foregoing six universities had a definite district assigned to it, from whence it was entitled to recruit students, and, as a further incentive to the pursuit of academic studies, a *ukaz* promulgated in 1809 proclaimed that in all appointments to official posts throughout the empire the holders of a university degree would receive the first consideration in the competition for vacancies. *Helsingfors.* In 1826 the university at Åbo in Finland was removed to Helsingfors, and still preserves the charter whereby, in its original home, it had been constituted a university by Queen Christina and her chancellor Oxenstiern in the year 1640. *Kiev. Odessa.* In 1832 the foundation of the St Wladimir University of Kiev absorbed both that at Wilna and the lyceum of Kremenetz. Odessa, founded in 1865, was designed to represent the university of New Russia. Although at St Petersburg considerable attention was regularly given to the teaching of languages, especially those of Armenia, Georgia, and Tatary, the general status of the Russian universities continued throughout the greater part of last century exceptionally low; and in 1884 they were all reconstituted by the promulgation of a "universal code"; with this the statutes of the universities at Dorpat (1632) and Warsaw (1886) are essentially in agreement. The former, originally founded at the suggestion of the governor-general, with the design of bringing "martial Livonia into the path of virtue and morality," was at first almost exclusively taught by German professors, of whom, however, very few had retained their chairs at the conclusion of last century. The study of the Slavonic languages, on the other hand, received a considerable stimulus; and when, by a decree in May 1887, the use of the Russian language was made obligatory in all places of instruction throughout the Baltic provinces, Russian began to displace German as the language of the lecture-room, the only faculties in which the use of German continued to be permissible being those of theology and medicine. *Tomsk.* The university of Tomsk in western Siberia, founded in 1888, recruited its numbers chiefly from students in the same faculties. It was, however, without endowment, and depended chiefly on a grant from the state aided by private liberality.

Influence of Dorpat. During the ensuing twenty years the general influence of Dorpat rapidly spread far beyond the Baltic provinces, while the number of students, which in 1879 was 1106, rose to nearly 2000.[1] In 1889, however, the appointment of the university officials was taken from the Senatus Academicus and entrusted to the state minister, a change which went far to deprive the university of its claim to be considered German. *Prague.* A like contest between contending nationalities met with a final solution at Prague, where a Czech university having been established on an independent basis, the German university began its separate career in the winter session of 1882–83. The German foundation retains certain revenues accruing from special endowments, but the state subvention is divided between the two.

The repudiation on the part of the Protestant universities of both papal and episcopal authority evoked a counter-demonstration among those centres which still adhered to Catholicism, while their theological intolerance gave rise to a great reaction, under the influence of which the medieval Catholic universities were reinvigorated and reorganized (although strictly on the traditional lines), while new and important centres were created. It was on the tide of this reaction, aided by their own skilful teaching and practical sagacity, that the Jesuits were borne to that commanding position which made them for a time the arbiters of education in Europe. *Bamberg.* The earliest university whose charter represented this reaction was that of Bamberg, founded by the prince-bishop Melchior Otto, after whom it was named "Academia Ottoniana." It was opened 1st September 1648, and received both from the emperor Frederick III. and Pope Innocent X. all the civil and ecclesiastical privileges of a medieval foundation. At first, however, it comprised only the faculties of arts and of theology; to these was added in 1729 that of jurisprudence, and in 1764 that of medicine. In this latter faculty Dr Ignatius Döllinger (the father of the historian) was for a long time a distinguished professor. The university library is of especial interest, as including that of an earlier Jesuit foundation and also valuable collections by private donors. Its collection of manuscripts in like manner includes those contained in some thirty suppressed monasteries, convents, and religious institutions at the time of the "secularization." *Innsbruck.* The university of Innsbruck was founded in 1672 by the emperor Leopold I., from whom it received its name of "Academia Leopoldina." In the following century, under the patronage of the empress Maria Theresa, it made considerable progress, and received from her its ancient library and bookshelves in 1745. In 1782 the university underwent a somewhat singular change, being reduced by the emperor Joseph II. from the status of a university to that of a lyceum, although retaining in the theological faculty the right of conferring degrees. In 1791 it was restored to its privileges by the emperor Leopold II., and since that time the faculties of philosophy, law and medicine have been represented in nearly equal proportions. *Breslau.* The foundation of the university of Breslau was contemplated as early as the year 1505, when Ladislaus, king of Hungary, gave his sanction to the project; but Pope Julius II., in the assumed interests of Cracow, withheld his assent.

The Jesuits in the university. Nearly two centuries later, in 1702, under singularly altered conditions, the Jesuits prevailed upon the emperor Leopold I. to found a university without soliciting the papal sanction. When Frederick the Great conquered Silesia in 1741, he took both the university and the Jesuits in Breslau under his protection, and when in 1774 the order was suppressed by Clement XIV. he established them as priests in the Royal Scholastic Institute, at the same time giving new statutes to the university. In 1811 the university was considerably augmented by the incorporation of that at Frankfort-on-the-Oder, and was ultimately reconstituted on lines similar to those of the newly founded university of Berlin. *Condition of the University of Paris.* In no country was the influence of the Jesuits on the universities more marked than in France. The civil wars in that country during the thirty years which preceded the close of the 16th century told with disastrous effects upon the condition of the university of Paris, and with the commencement of the 17th century its collegiate life seemed at an end, and its forty colleges stood absolutely deserted. To this state of affairs the obstinate conservatism of the academic authorities not a little contributed. The statutes by which the university was still governed were those which had been given by the cardinal D'Estouteville, the papal legate, in 1452, and remained entirely unmodified by the influences of the Renaissance. In 1579 the edict of Blois promulgated a scheme of organization for all the universities of the realm (at that time twenty-one in number)—a measure which, though productive of unity of teaching, did nothing towards the advancement of the studies themselves. The theological instruction became largely absorbed by the episcopal colleges, and acquired, in the schools of the different orders, a narrower and more dogmatic character. The eminent lawyers of France, unable to find chairs in Paris, distributed themselves among the chief towns

[1] See *Die deutsche Universität Dorpat im Lichte der Geschichte*, 1882.

of the provinces. The Jesuits did not fail to profit by this immobility and excessive conservatism on the part of the university, and during the second half of the 16th century and the whole of the 17th they had contrived to gain almost a complete monopoly of both the higher and the lower education of provincial France. Their schools rose at Toulouse and Bordeaux, at Auch, Agen, Rhodez, Périgueux, Limoges, Le Puy, Aubenas, Béziers, Tournon, in the colleges of Flanders and Lorraine, Douai and Pont-à-Mousson—places beyond the jurisdiction of the parlement of Paris or even of the crown of France. Their banishment from Paris itself had been by the decree of the parlement alone, and had never been confirmed by the crown. "Lyons," says Pattison, "loudly demanded a Jesuit college, and even the Huguenot Lesdiguières, almost king in Dauphiné, was preparing to erect one at Grenoble. Amiens, Rheims, Rouen, Dijon, and Bourges were only waiting a favourable opportunity to introduce the Jesuits within their walls."[1] The university was rescued from the fate which seemed to threaten it only by the excellent statutes given by Richer in 1598, and by the discerning protection extended to it by Henry IV., while its higher culture was in some measure provided for by the establishment by Richelieu in 1635 of the Académie française.

Colleges of the Jesuits in France.

The "college of Edinburgh" was founded by charter of James VI., dated 14th April 1582. This document contains no reference to a *studium generale*, nor is there ground for supposing that the foundation of a university was at that time contemplated. In marked contrast to the three older centres in Scotland, the college rose comparatively untrammelled by the traditions of medievalism, and its creation was not effected without some jealousy and opposition on the part of its predecessors. Its first course of instruction was commenced in the Kirk of Field, under the direction of Robert Rollock, who had been educated at St Andrews under Andrew Melville, the eminent Covenanter. "He began to teach," says Craufurd, "in the lower hall of the great lodging, there being a great concourse of students allured with the great worth of the man; but diverse of them being not ripe enough in the Latin tongue, were in November next put under the charge of Mr Duncan Narne, . . . who, upon Mr Rollock's recommendation, was chosen second master of the college."[2] In 1585 both Rollock and Nairne subscribed the National Covenant, and a like subscription was from that time required from all who were admitted to degrees in the college.

Edinburgh.

Disastrous as were the effects of the Thirty Years' War upon the external condition of the German universities, resulting in not a few instances in the total dispersion of the students and the burning of the buildings and libraries, they were less detrimental and less permanent than those which were discernible in the tone and temper of these communities. A formal pedantry and unintelligent method of study, combined with a passionate dogmatism in matters of religious belief and a rude contempt for the amenities of social intercourse, became the leading characteristics, and lasted throughout the 17th century. But in the year 1693 the foundation of the university of Halle opened up a career to two very eminent men, whose influence, widely different as was its character, may be compared for its effects with that of Luther and Melanchthon, and served to modify the whole current of German philosophy and German theology. Halle has indeed been described as "the first real modern university." It was really indebted for its origin to a spirit of rivalry between the conservatism of Saxony and the progressive tendencies of the house of Brandenburg, but the occasion of its rise was the removal of the ducal court from Halle to Magdeburg. The archbishopric of the latter city having passed into the possession of Brandenburg in 1680 was changed into a dukedom, and the city itself was selected as the ducal residence. This change left unoccupied some commodious buildings in Halle, which it was decided to utilize for purposes of education. A "Ritterschule" for the sons of the nobility was opened, and in the course of a few years it was decided to found a university. Saxony endeavoured to thwart the scheme, urging the proximity of Leipzig; but her opposition was overruled by the emperor Leopold I., who granted (19th October 1693) the requisite charter, and in the following year the work of the university commenced. Frankfort-on-the-Oder had by this time become a centre of the Reformed party, and the primary object in founding a university in Halle was to create a centre for the Lutheran party; but its character, under the influence of its two most notable teachers, Christian Thomasius and A. H. Francke, soon expanded beyond the limits of this conception to assume a highly original form. Thomasius and Francke had both been driven from Leipzig owing to the disfavour with which their liberal and progressive tendencies were there regarded by the academic authorities, and on many points the two teachers were in agreement. They both regarded with contempt alike the scholastic philosophy and the scholastic theology; they both desired to see the rule of the civil power superseding that of the ecclesiastical power in the seats of learning; they were both opposed to the ascendancy of classical studies as expounded by the humanists—Francke regarding the Greek and Roman pagan writers with the old traditional dislike, as immoral, while Thomasius looked upon them with contempt, as antiquated and representing only a standpoint which had been long left behind; both again agreed as to the desirability of including the elements of modern culture in the education of the young. But here their agreement ceased. It was the aim of Thomasius, as far as possible, to secularize education, and to introduce among his countrymen French habits and French modes of thought; his own attire was gay and fashionable, and he was in the habit of taking his seat in the professorial chair adorned with gold chain and rings, and with his dagger by his side. Francke, who became the leader of the Pietists, regarded all this with even greater aversion than he did the lifeless orthodoxy traditional in the universities, and was shocked at the worldly tone and disregard for sacred things which characterized his brother professor. Both, however, commanded a considerable following among the students. Thomasius was professor in the faculty of jurisprudence, Francke in that of theology. And it was a common prediction in those days with respect to a student who proposed to pursue his academic career at Halle, that he would infallibly become either an atheist or a Pietist. But the services rendered by Thomasius to learning were genuine and lasting. He was the first to set the example, soon after followed by all the universities of Germany, of lecturing in the vernacular instead of in the customary Latin; and the discourse in which he first departed from the traditional method was devoted to the consideration of how far the German nation might with advantage imitate the French in matters of social life and intercourse. His more general views, as a disciple of the Cartesian philosophy and founder of the modern Rationalismus, exposed him to incessant attacks; but by the establishment of a monthly journal (at that time an original idea) he obtained a channel for expounding his views and refuting his antagonists which gave him a great advantage. On the influence of Francke, as the founder of that Pietistic school with which the reputation of Halle afterwards became especially identified, it is unnecessary here to dilate.[3] Christian Wolf, who followed Thomasius as an assertor of the new culture, was driven from Halle by the accusations of the Pietists, who declared that his teaching was fraught with atheistical principles. In 1740, however, he was recalled by Frederick II., and reinstated in high office with every mark of consideration and respect. Throughout the whole of the 18th century Halle was the leader of academic thought and advanced theology in Protestant Germany, although sharing that leadership, after the middle of the century, with Göttingen. The university of Göttingen (named after its founder "Georgia Augusta") was endowed with the amplest privileges as a university by George II. of England, elector of Hanover, 7th December

1736. The imperial sanction of the scheme had been given three years before (13th January 1733), and the university was formally opened 17th September 1737. The king himself assumed the office of "rector magnificentissimus," and the liberality of the royal endowments (doubling those of Halle), and the not less liberal character of the spirit that pervaded its organization, soon raised it to a foremost place among the schools of Germany. Halle had just expelled Wolf; and Göttingen, modelled on the same lines as Halle, but rejecting its Pietism and disclaiming its intolerance, appealed with remarkable success to the most enlightened feeling of the time. It included all the faculties, and two of its first professors—Mosheim, the eminent theologian, from Helmstedt, and G. L. Böhmer, the no less distinguished jurist from Halle—together with Gesner, the man of letters, at once established its reputation. Much of its early success was also due to the supervision of its chief curator (there were two)—Baron Münchhausen, himself a man of considerable attainments, who by his sagacious superintendence did much to promote the general efficiency of the whole professoriate. Not least among its attractions was also its splendid library, located in an ancient monastery, and now containing over 200,000 volumes and 5000 MSS. In addition to its general influence as a distinguished seat of learning, Göttingen may claim to have been mainly instrumental in diffusing a more adequate conception of the importance of the study of history. Before the latter half of the 18th century the mode of treatment adopted by university lecturers was singularly wanting in breadth of view. Profane history was held of but little account, excepting so far as it served to illustrate ecclesiastical and sacred history; while this, again, was invariably treated in the narrow spirit of the polemic, intent mainly on the defence of his own confession, according as he represented the Lutheran or the Reformed Church. The labours of the professors at Göttingen, especially Putter, Gatterer, Schlözer and Spittler, combined with those of Mascov at Leipzig, did much towards promoting both a more catholic treatment and a wider scope. Not less beneficial was the example set at Göttingen of securing the appointment of its professors by a less prejudiced and partial body than a university board is only too likely to become. "'The Great Münchhausen,' says an illustrious professor of that seminary, 'allowed our university the right of presentation, of designation, or of recommendation, as little as the right of free election; for he was taught by experience that, although the faculties of universities may know the individuals best qualified to supply their vacant chairs, *they are seldom or never disposed to propose for appointment the worthiest within their knowledge.*'"[1] The system of patronage adopted at Göttingen was, in fact, identical with that which had already been instituted in the universities of the Netherlands by Douza. The university of Erlangen, a Lutheran centre, was founded by Frederick, margrave of Baireuth. Its charter was granted by the emperor Charles VII., 21st February 1743, and the university was formally constituted, 4th November. From its special guardian, Alexander, the last margrave of Ansbach, it was styled "Academia Alexandrina." In 1791, Ansbach and Baireuth having passed into the possession of Prussia, Erlangen also became subject to the Prussian government, and, as the 19th century advanced, her theological faculty became distinguished by the fervour and ability with which it championed the tenets of Lutheranism.

Erlangen.

The English and German universities compared.

On comparison with the great English universities, the universities of Germany must be pronounced inferior both in point of discipline and of moral control over the students. The superiority of the former in these respects is partly to be attributed to the more systematic care which they took, from a very early date, for the supervision of each student, by requiring that within a certain specified time after his entry into the university he should be registered as a pupil of some master of arts, who was responsible for his conduct, and represented him generally in his relations to the academic authorities. Marburg in its earliest statutes (those of 1529) endeavoured to establish a similar rule, but without success.[2] The development of the collegiate system at Oxford and Cambridge materially assisted the carrying out of this discipline. Although again, as in the German universities, feuds were not unfrequent, especially those between "north" and "south" (the natives of the northern and southern counties), the fact that in elections to fellowships and scholarships only a certain proportion were allowed to be taken from either of these divisions acted as a considerable check upon the possibility of any one college representing either element exclusively. In the German universities, on the other hand, the ancient division into nations, which died out with the 15th century, was revived under another form by the institution of national colleges, which largely served to foster the spirit of rivalry and contention. The demoralization induced by the Thirty Years' War and the increase of duelling intensified these tendencies, which, together with the tyranny of the older over the younger students, known as "Pennalismus," were evils against which the authorities contended, but ineffectually, by various ordinances. The institution of "Burschentum," having for its design the encouragement of good fellowship and social feeling irrespective of nationality, served only as a partial check upon these excesses, which again received fresh stimulus by the rival institution of "Landsmannschaften," or societies of the same nationality. The latter proved singularly provocative of duelling, while the arrogant and even tyrannical demeanour of their members towards the unassociated students gave rise to a general combination of the latter for the purposes of self-defence and organized resistance.

Extinction of German universities during 1798–1815.

The political storms which marked the close of the 18th and the beginning of the 19th century gave the death-blow to not a few of the ancient universities of Germany. Mainz and Cologne ceased to exist in 1798; Bamberg, Dillingen and Duisburg in 1804; Rinteln and Helmstedt in 1809; Salzburg in 1810; Erfurt in 1816. Altdorf was united to Erlangen in 1807, Frankfort-on-the-Oder to Breslau in 1809, and Wittenberg to Halle in 1815. The university of Ingolstadt was first moved in 1802 to Landshut, and from thence in 1826 to Munich, where it was united to the academy of sciences which was founded in the Bavarian capital in 1759. Münster in Prussia was for the first time constituted a university in four faculties by Maximilian Frederick (elector and archbishop) in 1771. Its charter was confirmed by Clement XIV. in 1773, and again by the Emperor Joseph II. The university was abolished in the year 1818; but two faculties, those of theology and philosophy, continued to exist, and in 1843 it received the full privileges of a Prussian university together with the designation of a royal foundation. Of those of the above centres which altogether ceased to exist, but few were much missed or regretted—that at Mainz, which had numbered some six hundred students, being the one notable exception. The others had for the most part fallen into a perfunctory and lifeless mode of teaching, and, with wasted or diminished revenues and declining numbers, had long ceased worthily to represent the functions of a university, while the more studious in each centre were harassed by the frequency with which it was made an arena for political demonstrations. Whatever loss may have attended their suppression was more than compensated by the activity and influence of the three great German universities which rose in the last century.

Munich.

Münster.

Munich, after having been completely reorganized, soon became a distinguished centre of study in all the faculties; and

[1] Hamilton, *Discussions*, p. 381.

[2] "Volumus neminem in hanc nostram Academiam admitti, aut per rectorem in album recipi, qui non habeat privatum atque domesticum praeceptorem, qui ejus discipulum agnoscat, ad cujus judicium quisque pro sua ingenii capacitate atque Marte lecturas et publicas et privatas audiat, a cujus latere aut raro aut nunquam discedat." Koch expressly compares this provision with the discipline of Oxford and Cambridge, which, down to the commencement of the present century, was very much of the same character (Koch, *Gesch. des academischen Pädagogiums in Marburg*, p. 11).

its numbers, allowing for two great wars, have been continuously on the increase, the eminence of its professoriate, among whom have been Döllinger, Liebig, Schelling, Zeuss and Giesebrecht, having attracted students from all parts of Europe.

The university of Berlin, known as the *Royal* Friedrich Wilhelm University, was founded in 1809, immediately after the peace of Tilsit, when Prussia had been reduced to the level of a third-rate Power. Under the guiding influence of Wilhelm von Humboldt, however, supported by the strong purpose of Frederick William III., the principles adopted in connexion with the new seat of learning not only raised it to a foremost place among the universities of Europe, but also largely conduced to the regeneration of Germany. It had not only incorporated at the time of its foundation the famous "Academy of Sciences" of the city, but expressly repudiated all attachment to any particular creed or school of thought, and professed subservience only to the interests of science and learning. "Each of the eminent teachers with whom the university began its life—F. A. Wolfe, Fichte, Savigny, Reil—represented only himself, the path of inquiry or the completed theory which he had himself propounded. Its subsequent growth was astonishing, and before the 19th century closed the number of its matriculated students exceeded that of every other university except Vienna."

Berlin.

The university of Bonn, founded in 1818 and also by Friedrich Wilhelm III., thus became known as the *Rhenish* Friedrich Wilhelm University—it being the design of the founder to introduce into the Rhine provinces the classic literature and the newly developed scientific knowledge of Germany proper. With this aim he summoned to his aid the best available talent, among the earlier instructors being Niebuhr, A. W. von Schlegel, with C. F. Nasse in the faculty of medicine and G. Hermes in that of theology. In the last-named faculty it further became noted for the manner in which it combined the opposed schools of theological doctrine—that of the Evangelical (or Lutheran) Church and that of the Roman Catholic Church here standing side by side, and both adorned by eminent names. After the war with Austria in 1859 the German universities underwent a considerable change owing to the enforced military service required by the law of 1867; and the events of 1870 were certainly not disconnected with the martial spirit which had been evoked in the student world, while in the universities themselves there had risen up a new and more lively interest in political affairs.

Bonn.

In 1878 a comparison of the numbers of the students in the different faculties in the Prussian universities with those for the year 1867 showed a remarkable diminution in the faculty of theology, amounting in Lutheran centres to more than one-half, and in Catholic centres to nearly three-fourths. In jurisprudence there was an increase of nearly two-fifths, in medicine a decline of a third, and in philosophy an increase of one-fourth.

Fluctuations of numbers in the faculty of theology.

The universities of the United Provinces, like those of Protestant Germany, were founded by the state as schools for the maintenance of the principles of the Reformation and the education of the clergy, and afforded in the 16th and 17th centuries a grateful refuge to not a few of those Huguenot or Port-Royalist scholars whom persecution compelled to flee beyond the boundaries of France, as well as to the Puritan divines who were driven from England. The earliest, that of Leiden (in what was then the county of Holland), founded in 1575, commemorated the gallant and successful resistance of the citizens to the Spanish forces under Requesens. Throughout the 17th century Leiden was distinguished by its learning, the ability of its professors, and the shelter it afforded to the more liberal thought associated at that period with Arminianism. Much of its early success was owing to the wise provisions and the influence of the celebrated Janus Douza:— "Douza's principles," says Hamilton, "were those which ought to regulate the practice of all academical patrons; and they were those of his successors. He knew that at the rate learning was seen prized by the state in the academy, would it be valued by the nation at large. . . . He knew that professors wrought more even by example and influence than by teaching, that it was theirs to pitch high or low the standard of learning in a country, and that, as it proved easy or arduous to come up with them, they awoke either a restless endeavour after an even loftier attainment, or lulled into a self-satisfied conceit." Douza was, for Leiden and the Dutch, what Münchhausen afterwards was for Göttingen and the German universities. "But with this difference: Leiden was the model on which the younger universities of the republic were constructed; Göttingen the model on which the older universities of the empire were reformed. Both Münchhausen and Douza proposed a high ideal for the schools founded under their auspices; and both, as first curators, laboured with paramount influence in realizing this ideal for the same long period of thirty-two years. Under their patronage Leiden and Göttingen took the highest place among the universities of Europe; and both have only lost their relative supremacy by the application in other seminaries of the same measures which had at first determined their superiority." The appointment of the professors at Leiden was vested in three (afterwards five) curators, one of whom was selected from the body of the nobles, while the other two were appointed by the states of the province—the office being held for nine years, and eventually for life. With these was associated the mayor of Leiden for the time being. The university of Francker was founded in 1585 on a somewhat less liberal basis than Leiden, the professors being required to declare their assent to the rule of faith embodied in the Heidelberg Catechism and the confession of the "Belgian Church." Its four faculties were those of theology, jurisprudence, medicine, and "the three languages and the liberal arts."[1] For a period of twelve years (*c.* 1610–22) the reputation of the university was enhanced by the able teaching of William Ames ("Amesius"), a Puritan divine and moralist who had been driven by Archbishop Bancroft from Cambridge and from England. His fame and ability are said to have attracted to Franeker students from Hungary, Poland and Russia.

Universities of United Provinces.

Leiden.

Franeker.

With similar organization were founded the universities of Harderwijk (1600), Groningen (1614) and Utrecht (1634), the last-named being much frequented in the 18th century by both English and Scottish students who repaired thither to obtain instruction of a kind that Oxford and Cambridge at that time failed altogether to impart—more than a fourth of the students of Utrecht about the year 1736 being of those nationalities. In the 19th century, however, political considerations began seriously to diminish such intercourse between different centres, and during the first Napoleon's tenure of the imperial dignity the universities in both the "kingdom of Holland" and the Austrian Netherlands (as they were then termed) were in great peril. But on the settlement of Europe in 1814–15 the restoration of the house of Orange and consequent formation of the "kingdom of the Netherlands" brought both realms under a single rule. The universities of Franeker and Harderwijk were suppressed, and those of Ghent and Liége created, while a uniform constitution was given both to the Dutch and Belgian universities. It was also provided that there should be attached to each a board of curators, consisting of five persons, "distinguished by their love of literature and science and by their rank in society," to be nominated by the king, and at least three of them to be chosen from the province in which the university was situated, the other two from adjacent provinces. After the lapse of another fifteen years, however, the kingdom of the Netherlands having been reduced to its present limits and the kingdom of Belgium (identical for the most part with the Austrian Netherlands) newly created, an endeavour was made in dealing with the whole question of secondary education to give a fuller recognition to both traditional creeds and ethnic affinities. At Louvain, the chief Catholic centre, the faculties of law, medicine

and philosophy had already, in 1788, been removed to Brussels—an almost unique example of a university which owed its origin neither to a temporal nor an ecclesiastical authority—and in 1834 Brussels was constituted a free and independent university with a new fourth faculty of natural science, and supported mainly by contributions from the Liberal party. Having, however, no charter, it continued incapable by law of possessing property. While Louvain and Brussels thus represented to a great extent the two chief political parties in the realm, the universities of Ghent on the Scheldt and Liége on the Meuse recruited their students mainly from the two chief races—the Flemish and the Walloon. In Holland, on the other hand, where no such marked racial differences exist, the universities of Groningen, Leiden and Utrecht have been assimilated (1876) in constitution, each being administered by a consistory of five rectors with a senate composed of the professors in the respective faculties. The foundation of the university of Amsterdam (1877) more than repaired the loss of Franeker and Harderwijk, and the progress of this new centre during the first ten years of its existence was remarkably rapid. The higher education of women has made some progress in the Netherlands.

Brussels.

Amsterdam.

In Sweden the foundation of the university of Upsala, sanctioned in 1477 by Sixtus IV. as a studium generale on the model of Bologna, was followed at a long interval by that of Lund (1666), which was created during the minority of Charles XI. with statutes and privileges almost identical with those of Upsala and with an endowment largely derived from the alienated revenues of the chapter of the cathedral. The students were recruited from Denmark, Germany and Sweden; and Puffendorf, the civilian, was one of its first professors. During Charles's reign its resources were in turn confiscated, and the university itself was closed in 1676 in consequence of the war with Denmark. When again opened it remained for a long time in a very depressed condition, from which it failed to rally until the 19th century, when it took a new departure, and the erection of its handsome new buildings (1882) invested it with additional attractions. The royal university of Upsala, roused to new life in the 17th century by the introduction of the Cartesian philosophy, has been throughout (notwithstanding its singularly chequered history), the chief home of the higher Swedish education. In the 18th century lectures began to be delivered in Swedish; while the medieval division of the students into "nations" continued, as at Lund, until the second quarter of the 19th. The various changes and events during the interesting period 1872 to 1897 have been recorded at length in the national tongue by Reinhold Geijer in a handsome quarto which appeared in 1897. Gothenburg, on the other hand, with its society of science and literature, dating from 1841, has represented rather a popular institution, existing independently of the state, maintained chiefly by private contributions, and governed by a board called the *Curatorium*. For a long time it was not empowered to hold examinations. Stockholm (1878) still remains a gymnasium, but its curriculum is to a certain extent supplemented by its connexion with Upsala, from which it is little more than forty miles distant by rail. The university of Christiania in Norway, founded in 1811, and the Swedish universities are strongly Lutheran in character; and all alike are closely associated with the ecclesiastical institutions of the Scandinavian kingdoms. The same observation applies to Copenhagen—where, however, the labours of Rask and Madvig have done much to sustain the reputation of the university for learning. The royal university of Kiel was founded in 1665 by Duke Christian Albrecht of Holstein (who himself assumed the office of rector) with faculties of theology, law, medicine and philosophy. It maintained its ground, although not without difficulty, amid the feuds that frequently arose between its dukes and the kings of Denmark, and under the rule of Catherine II. of Russia and after the incorporation of Schleswig-Holstein with the kingdom of Denmark made a marked advance. In the latter half of last century it acquired new buildings and rose into high reputation as a school of chemistry, physiology and anatomy, while its library in 1904 exceeded 250,000 volumes.

Universities of Sweden and Norway.

Upsala.

Christiania.

Kiel.

The number of universities founded in the last century is in striking contrast to the paucity which characterizes the two preceding centuries, an increase largely resulting, however, from the needs of English colonies and dependencies. In the Mediterranean, Genoa (1812), Messina (1838) and Marseilles (1854) were foundations which supplied a genuine want and have gradually attained to a fair measure of success. The first had previously existed as a school of law and medicine, but when, along with the rest of the Ligurian republic, it became incorporated in the empire under Napoleon I., the emperor, in order to conciliate the population, raised it to the rank of a university in 1812. The university subsequently fell into the hands of the Jesuits, who maintained their tenure of the principal chairs until the unification of the Italian kingdom under Victor Emmanuel, when Messina, which had been founded during the rule of the Bourbons over the Two Sicilies, became similarly included under Italian rule. Of Marseilles mention has above been made.

Genoa.

Messina.

Marseilles.

In France the fortunes of academic learning were even less happy than in Germany. The university of Dôle in Franche Comté had for two hundred years been a flourishing centre of higher education for the aristocracy, and was consequently regarded with envy by Besançon. In 1691, however, when the country had been finally ceded to France, and Savoy had been subjugated by the arms of Catina, Louis XIV. was induced, on the payment of a considerable sum, to transfer the university to Besançon. Here it forthwith acquired enhanced importance under the direction of the Jesuits. But in 1722, on the creation of a university at Dijon, the faculty of law was removed to that city, where it continued to exist until the Revolution.

Dôle.

Dijon.

The university of Paris indeed was distracted, throughout the 17th century, by theological dissensions—in the first instance owing to the struggle that ensued after the Jesuits had effected a footing at the Collège de Clermont, and subsequently by the strife occasioned by the teaching of the Jansenists. Its studies, discipline and numbers alike suffered. Towards the close of the century a certain revival took place, and a succession of illustrious names—Pourchot, Rollin, Grenan, Coffin, Demontempuys, Crevier, Lebeau—appear on the roll of its teachers. But this improvement was soon interrupted by the controversies excited by the promulgation of the bull Unigenitus in 1713, condemning the tenets of Quesnel, when Rollin himself, although a man of singularly pacific disposition, deemed it his duty to head the opposition to Clement XI. and the French episcopate. At last, in 1762, the parlement of Paris issued a decree (August 6) placing the colleges of the Jesuits at the disposal of the university, and this was immediately followed by another for the expulsion of the order from Paris, the university being installed in possession of their vacated premises. Concurrently with this measure, the curriculum of prescribed studies assumed a more hopeful character, and both history and natural science began to be cultivated with a certain success. These innovations, however, were soon lost sight of in the more sweeping changes which followed upon the Revolution. On the 15th of September 1793 the universities and colleges throughout France, together with the faculties of theology, medicine, jurisprudence and arts, were abolished by a decree of the convention, and the whole system of national education may be said to have remained in abeyance, until, in 1808, Napoleon I. promulgated the scheme which in its essential features is almost identical with that which at present obtains—the whole system of education, both secondary and primary, being made subject to the control and direction of the state. In pursuance of this conception, the "university of France," as it was henceforth styled, became little more

University of Paris from the 17th century.

than an abstract term[1] signifying collectively the various centres of professional education in their new relations to the state. All France was divided into seventeen districts, designated "academies," each administered by its own rector and council, but subject to the supreme authority of the minister of public instruction, and representing certain faculties which varied at different centres in conformity with the new scheme of distribution for the entire country.

While, accordingly, three new "academies"—those of Lille, Lyons and Rennes—date their commencement from 1808, many of the pre-existing centres were *completely suppressed*. **Lille, Lyons and Rennes.** In some cases, however, the effacement of an ancient institution was avoided by investing it with new importance, as at Grenoble; in others, the vacated premises were appropriated to new uses connected with the department, as at Avignon, Cahors and Perpignan. Each rector of an "academy" was also constituted president of a local *conseil d'enseignement*, in conjunction with which he nominated the professors of lycées and the communal schoolmasters,[2] these appointments being subsequently ratified by a promotion committee sitting in Paris. In 1895, however, the government was prevailed upon to sanction the **Institution of "free faculties."** institution of certain "free faculties," as they were termed, to be placed under the direction of the bishop, and depending for support upon voluntary contributions, and each including a faculty of theology. The faculty at Marseilles, on the other hand, which originated in an earlier "faculty of sciences" founded in 1854, was now called upon to share the governmental grant with Aix, and the two centres became known as the Académie d'Aix-Marseille— **Aix-Marseille.** the faculties in the latter being restricted to mathematics and natural science (including a medical school), while faculties of law and philosophy were fixed at Aix, which possesses also the university library properly so termed. In the capital itself, the university of Paris and the École Pratique des Hautes Études carried on the work of higher instruction independently of each other—the former with faculties of Protestant theology, law, medicine, science, letters and chemistry distributed over the Quartier Latin; the latter with schools of mathematics, natural science, history, philology, and history of religions centred at the Sorbonne.

The Collège de France, founded in the 16th century by Francis I., was from the first regarded with hostility both by the university and by the Sorbonne. **Collège de France.** It became, however, so highly esteemed as a school of gratuitous instruction in Latin, Greek and Hebrew, that it not only held its ground, but at the Revolution ultimately survived alike the universities and their hostility. As reconstituted in 1831 it became chiefly known as an institution for the instruction of adults, and its staff of professors, some fifty in number (including their deputies), has comprised from time to time the names of not a few of the most distinguished scholars and men of science in the country. **Strassburg.** The university of Strassburg, which in the latter part of the 18th century had been distinguished by an intellectual activity which became associated with the names of Goethe, Herder and others, was also swept away by the Revolution. It was revived in 1804 as a Protestant "academy," but four years later incorporated in the newly created "academy" of Nancy, with a faculty of Protestant theology which lasted only until 1818.

In Switzerland the universities shared in the conflicts handed down from the days when the Helvetic republic had been first created, and each with somewhat similar experiences. **Switzerland.** In 1832, Basel having joined the *Sarner Bund* or League of the Catholic Cantons, the Confederates divided the canton into two, and agreed to raise the flourishing Hochschule which already existed at Zürich to the rank of a university—a measure which may be said to mark a turning-point in the history of the higher **Zürich.** education of the republic. In 1839, however, the teaching of D. F. Strauss, who had been installed in the chair of theology at Zürich soon after his expulsion from Tübingen, gave rise to a popular demonstration which not only brought about the overthrow of the governing body, but placed the existence of the university itself in jeopardy. But the storm was successfully weathered, and in 1859 the statutes were revised and a considerable addition made to the professoriate. The gymnasium of Bern, originally established under the teaching of Ulrich Zwingli, developed in 1834 into a **Bern.** university with all the faculties, those of medicine and philosophy rising with the advance of the century into high repute. As early as 1586 Lausanne had been a noted school for the education of Protestant ministers, but it was **Lausanne.** not until 1806 that chairs of philosophy and law were established, to which those of natural science and literature were added in 1836, and, somewhat later, that of medicine. It was not, however, until 1891 that Lausanne was formally constituted a university. At Geneva the famous academy of the 16th and 17th centuries, long distinguished as **Geneva.** a centre of Calvinistic teaching, became merged in 1876 in a university, where the instruction (given mainly in the French language) was carried on by a staff of forty-one professors. With this was also incorporated an earlier school of science, in which De Saussure and De Candolle had once been teachers. Fribourg, founded in 1889 as a university of the canton so named, began with only two faculties—those of **Fribourg.** law and philosophy, to which one of theology was added in the following year. A certain spirit of innovation characterized most of the Swiss universities at this time, especially in connexion with female education. At Zürich, in 1872 (and somewhat later at Geneva and Bern), women were admitted to the lectures, and in 1892 were permitted themselves to lecture, a lady, Frau Dr Emilie Kempin, succeeding to the chair of Roman law. At Fribourg the proposition was first brought forward that all professors should be appointed only for a specified period, a limitation which along with other questions affecting the professorial body gave rise to much divergence of opinion.

In Spain the act of 1857 introduced a radical change similar to that in France, the whole system of education being placed under the responsible control of the minister for that department, while the entire kingdom was at the same time divided into ten university districts—Madrid, Barcelona, Granada, Oviedo, Salamanca, Santiago, Seville, Valencia, Valladolid and Saragossa—the rector of the universities in each district representing the chief authority. The degrees to be conferred at each were those of bachelor, licentiate and doctor. **Spain and Portugal.** Each university received a rector of its own, selected by the government from among the professors, and a precise plan of instruction was prescribed in which every hour had its appointed lecturer and subject. Philosophy, natural science, law and medicine were to be studied at all these universities, and at the majority a school of chemistry was subsequently instituted, except at Oviedo, which was limited to a faculty of law and a school for notaries. But at Salamanca, Valladolid, Seville and Saragossa no school of chemistry was instituted, and at the first three that of medicine ultimately died out. No provision was made for instruction in theology, this being relegated to the seminaries in the episcopal cities. The university of Manila in the Philippines was opened in 1601 as a school for the nobility, and ten years later the famous college of St Thomas was founded by the Dominican order; but it was not until 1857 that the university, properly speaking, was founded by royal Spanish decree. In Portugal, **Coimbra.** Coimbra, which narrowly escaped suppression in the 16th century and was removed from 1380 to 1537 to Lisbon, has long been a flourishing school. Its instruction is given gratis; but, as all members of the higher courts of judicature and administration in the realm are required to have graduated

[1] It retains a certain professional meaning, in that a student studying for the "university" is understood to be one who is himself aiming at the profession of a teacher in a *lycée*.

[2] The préfet of the department has since taken the place of the rector with regard to nominations.

at the university, it is at the same time one of the most aristocratic schools in Europe. Of its five faculties, theology, jurisprudence, medicine, mathematics and philosophy, that of law is by far the most flourishing, the number of students in this faculty nearly equalling the aggregate of all the rest. In 1772 the university received new statutes and was to a great extent reorganized. There is a valuable library, largely composed of collections formerly belonging to suppressed convents. As a school of theology Coimbra has always been distinctly anti-ultramontane.

Italy. In Italy, as in Spain, education for the church has been relegated almost entirely to the numerous "seminaries," where it is of an almost entirely elementary character. In 1875 a laudable effort was made by R. Bonghi, the minister of education, to introduce reforms and to assimilate the universities in their organization and methods to the German type. His plans were, however, to a great extent reversed by his successor, Coppino.

Austria-Hungary. Vienna. In Austria the universities, being modelled on the same system as those of the German Empire, present no especially noteworthy features, except that the sphere of the functions of a rector corresponds precisely with that of the rector in those German universities which have no curator, and the faculties are represented by the ordinary professors as a body along with two representatives of the "Privatdozents." Vienna has long been chiefly distinguished for its school of medicine, which enjoyed in the last century a reputation almost unrivalled in Europe. The other faculties were, however, suffered to languish, and throughout the first half of the last century the whole university was in an extremely depressed state. From this condition it was in a great measure restored by the exertions of Count Thun. The university of Olmütz, founded in 1581, was formerly in possession of what is now the imperial library, and contained also a valuable collection of Slavonic works, which were carried off by the Swedes and ultimately dispersed. ***Olmütz.*** It was suppressed in 1853, and is now represented only by a theological faculty. The university of Graz, the capital of Styria, was founded in 1586, and has long been one of the most flourishing centres, with nearly 2000 students, chiefly in law and philosophy. ***Graz. Salzburg. Lemberg.*** The university of Salzburg, founded in 1623, was suppressed in 1810; that of Lemberg, founded in 1784 by the Emperor Joseph II., was removed in 1805 to Cracow and united to that university. In 1816 it was opened on an independent basis. In the bombardment of the town in 1848 the university buildings were burnt down, and the site was changed to what was formerly a Jesuit convent. The fine library and natural history museum were at the same time almost entirely destroyed. The most recent foundation is that of Czernowitz (1875), with faculties of theology (Greek Church), law and political economy, and philosophy. ***Czernowitz.*** The universities of the Hungarian kingdom are three in number:—Budapest, originally founded at Tyrnau in 1635 under the auspices of the Jesuits, now possessing four faculties—theology, jurisprudence, medicine and philosophy (number of professors in 1903, 180; students, 3223); ***Budapest.*** Kolozsvar (Klausenburg), the chief Magyar centre, founded in 1872 and also comprising four faculties, but where mathematics and natural science supply the place of theology; ***Klausenburg. Agram.*** Zágráb (Agram), the Slovack university, in Croatia, originally founded by Maria Theresa in 1776 from some suppressed schools of the Jesuits, and reopened in 1874 with three faculties, viz. jurisprudence, theology and philosophy. The chief centre of Protestant education is the college at Debreczen, founded in 1531, which in past times was not infrequently subsidized from England. ***Debreczen.*** It has faculties of law and theology, courses of instruction in philosophy, and a school for teachers, and possesses a fine library.

Japan. In Japan there are two imperial universities—Tokyo (1868) and Kioto (1897)—the former representing the union of two pre-existing foundations, on which occasion it was placed under the control of the minister of instruction with yearly grants from the treasury. The ordinary course of studies was limited to three years, that of medicine being extended to four. Kioto was formed out of four previously existing colleges of law, medicine, science and engineering.

Athens. The "National University" of Athens (founded May 22, 1837) was modelled on the university systems of northern Germany, on a plan originally devised by Professor Brandis. It originally included only four faculties, viz. theology, jurisprudence, medicine and philosophy, to which one of applied mathematics was subsequently added.

Turkey and Bulgaria. In European Turkey the university of Jassy (1860) in Rumania was founded by its ruler, Prince Cuza, and together with the newly founded university of Bucharest received its completed organization in 1864. Both were constituted state institutions and were represented in the senate, although not receiving any fixed revenues from the government. Its students are instructed and examined gratuitously. In the university of Sophia (1888) in Bulgaria, faculties were established, in the course of the ensuing four years, of history, philology, physics, mathematics and jurisprudence, the main object in view being the training of competent teachers of schools and of lawyers, and affording them the means of gaining an intelligent insight into the real wants of the native population. The university of Constantinople was founded in 1900 at the jubilee festival in honour of the sultan's succession to the throne. It included five faculties and was placed under the control of a director and sub-director, the former being invested with authority over teachers and scholars alike.

The English universities since the medieval period. The history of the two English universities during the 16th and following centuries has presented, for the most part, features which contrast strongly with those of the continental seats of learning. Both suffered severely from confiscation of their lands and revenues during the period of the Reformation, but otherwise have generally enjoyed a remarkable immunity from the worst consequences of civil and political strife and actual warfare. Both long remained centres chiefly of theological teaching, but their intimate connexion at once with the state and with the Church of England, as "by law established," and the modifications introduced into their constitutions, prevented their becoming arenas of fierce polemical contentions like those which distracted the Protestant universities of Germany.

Influence of the Renaissance. The influence of the Renaissance, and the teaching of Erasmus, who resided for some time at both universities, exercised a notable effect alike at Oxford and at Cambridge. The names of Colet, Grocyn and Linacre illustrate this influence at the former centre; those of Bishop Fisher, Sir John Cheke and Sir Thomas Smith at the latter. The labours of Erasmus at Cambridge, as the author of a new Latin version of the New Testament, with the design of placing in the hands of students a text free from the errors of the Vulgate, were productive of important effects, and the university became a centre of Reformation doctrine some years before the writings of Luther became known in England. ***The Reformation at Cambridge.*** The foundation of Christ's College (1505) and St John's College (1511), through the influence of Fisher with the countess of Richmond, also materially aided the general progress of learning at Cambridge. The Royal Injunctions of 1535, embodying the views and designs of Thomas Cromwell, mark the downfall of the old scholastic methods of study at both universities; and the foundation of Trinity College, Cambridge, in 1547 (partly by an amalgamation of two older societies), represents the earliest conception of such an institution in England in complete independence of Roman Catholic traditions. Trinity (1554) and St John's (1555) at Oxford, on the other hand, founded during the reactionary reign of Mary, serve rather as examples of a transitional period.

In the reign of Elizabeth Cambridge became the centre of another great movement—that of the earlier Puritanism, St John's and Queens' being the strongholds of the party led by Cartwright, Walter Travers and others. Whitaker, the eminent master of St John's, although he sympathized to some extent with these views, strove to keep their expression within limits compatible with conformity to the Church of England. But the movement continued to gather strength; and Emmanuel College, founded in 1584, owed much of its early prosperity to the fact that it was a known school of Puritan doctrine. Most of the Puritans objected to the discipline enforced by the university and ordinary college statutes—especially the wearing of the cap and the surplice and the conferring of degrees in divinity. The Anglican party, headed by such men as Whitgift and Bancroft, resorted in defence to a repressive policy, of which subscription to the Acts of Supremacy and Uniformity, and the Elizabethan statutes of 1570 (investing the "caput" with larger powers, and thereby creating a more oligarchical form of government), were the most notable results. Oxford, although the Puritans were there headed by Leicester, the chancellor, devised at the same time a similar scheme, the rigid discipline of which was further developed in the Laudian or Caroline statutes of 1636. It was under these respective codes—the Elizabethan statutes of 1570 and the Laudian statutes of 1636—that the two universities were governed until the introduction of the new codes of 1858. The fidelity with which both universities adhered to the royal cause in the Civil War caused them to be regarded with suspicion by the Puritan party, and under the Commonwealth both Oxford and Cambridge were for a brief period in great danger owing to the distrust, which culminated among the members of the "Nominated Parliament" (July–December 1653), of university education generally, as tending to foster contentiousness with respect to religious belief. It was even proposed by William Dell—himself the master of Caius College—to abolish the two universities altogether, as hopelessly pledged to antiquated and obsolete methods, and to establish in their place schools for the higher instruction throughout the country. They were saved, however, by the firmness of Cromwell, at that time chancellor of Oxford, and, although Aristotle and the scholastic philosophy no longer held their ground, a marked improvement was observable both in discipline and morality among the students, and the prescribed studies were assiduously pursued. At Oxford, under the influence and teaching of Dr Wilkins, Seth Ward and John Wallis, a flourishing school of mathematics was formed at a time when the study had died out at Cambridge.

Puritanism at Cambridge.

Elizabethan statutes of 1570.

Laudian statutes of 1636.

After the Restoration Cambridge became the centre of a remarkable movement (a reflex of the influence of the Cartesian philosophy), which attracted for a time considerable attention. Its leaders, known as the Cambridge Platonists, among whom Henry More, Cudworth and Whichcote were especially conspicuous, were men of high character and great learning, although too much under the influence of an ill-restrained enthusiasm and purely speculative doctrines. The spread of the Baconian philosophy, and the example of a succession of eminent scientific thinkers, among whom were Isaac Barrow, master of Trinity (1673–77), the two Lucasian professors, Isaac Newton (prof. 1669–1702) and his successor William Whiston (prof. 1702–11), and Roger Cotes (Plumian prof. 1707–16), began to render the exact sciences more and more an object of study, and the institution of the tripos examinations in the course of the first half of the 18th century established the reputation of Cambridge as a school of mathematical science. At Oxford, where the study had in turn declined, and where the statutable requirements with respect to lectures and exercises were suffered to fall into neglect, the degeneracy of the whole community as a school of academic culture is attested by evidence too emphatic to be gainsaid. The moral tone at both universities was at this time singularly low; and the rise of Methodism as associated with the names of the two Wesleys and Whitefield at Oxford and that of Berridge at Cambridge, operated with greater effect upon the nation at large than on either of the two centres where it had its origin. With the advance of the next century, however, a perceptible change took place. The labours of Charles Simeon at Cambridge, in connexion with the Evangelical party, and the far more celebrated movement known as Tractarianism, at Oxford, exercised considerable influence in developing a more thoughtful spirit at either university. At both centres, also, the range of studies was extended: written examinations took the place of the often merely formal *viva voce* ceremonies; at Cambridge the study of the classics was raised in 1824 to the dignity of a new tripos. The number of the students at both universities increased, the matriculations at each rising to over four hundred. Further schemes of improvement were put forward and discussed. And in 1850 it was decided by the government to appoint commissioners to inquire what additional reforms might advantageously be introduced. Their recommendations were not all carried into effect, but the main results were as follows: "The professoriate was considerably increased, reorganized and re-endowed, by means of contributions from colleges. The colleges were emancipated from their medieval statutes, were invested with new constitutions, and acquired new legislative powers. The fellowships were almost universally thrown open to merit, and the effect of this was not merely to provide ample rewards for the highest academical attainments, but to place the governing power within colleges in the hands of able men, likely to promote further improvements. The number and value of scholarships were largely augmented, and many, though not all, of the restrictions upon them were abolished. The great mass of vexatious and obsolete oaths was swept away; and, though candidates for the M.A. degree and persons elected to fellowships were still required to make the old subscriptions and declarations, it was enacted that no religious test should be imposed at matriculation or on taking a bachelor's degree."[1]

Reforms of 1858.

In 1869 a statute was enacted at Cambridge admitting students as members of the university without making it imperative that they should be entered at any hall or college, but simply be resident either with their parents or in duly licensed lodgings.

Admission of non-collegiate students.

The entire abolition of tests followed next. After being rejected on several occasions in parliament it was eventually carried as a government measure, and passed the House of Lords in 1871.

Abolition of tests.

In 1877 the reports of two new commissions were followed by further changes, the chief features of which were the diversion of a certain proportion of the revenues of the colleges to the uses of the university, especially with a view to the encouragement of studies in natural science; the enforcement of general and uniform regulations with respect to the salaries, selection and duties of professors, lecturers and examiners; the abolition (with a few exceptions) of all clerical restrictions on headships or fellowships; and the limitation of fellowships to a uniform amount.

Reforms of 1877.

That these successive and fundamental changes were on the whole in unison with the national wishes and requirements may fairly be inferred from the remarkable increase in numbers at both universities, especially at Cambridge, where the number of undergraduates, which in 1862 was 1526, rose in 1887 to 2979. In the academic year 1862–63 the number of matriculations was 448, and in 1906–7 1083. The following universities and colleges, twenty-two in number, have since, in the order of their enumeration, sought and received the privilege of affiliation: University College, Nottingham; university of Sheffield; university of Adelaide; St David's College, Lampeter; university of Calcutta; university college of Wales, Aberystwyth; university of New Zealand; university of the Cape of Good Hope; university of Allahabad; Punjab University; university of Bombay; university of Toronto; St Edmund's College, Ware; university of Madras; university of Sydney; M'Gill University, Montreal; university of Tasmania; university of New Brunswick; Hartley University

Affiliated universities and colleges.

College, Southampton; University College of South Wales and Monmouthshire, Cardiff; university of King's College, Windsor, Nova Scotia; university of Queen's College, Kingston, Ontario.

The changes introduced by the legislation of 1877 have been gradually carried out as the occurrence of vacancies in the colleges has made possible the appropriation of portions of their revenue for the foundation of professorships and other university purposes, though in some cases the intentions of the commissioners have been frustrated by the effects of agricultural depression upon college revenues. The general effect of the revolution has been a marked diminution in the clerical character of the college teaching bodies, the conversion of the college teaching staff from a temporary employment for bachelors awaiting livings or other preferment into a permanent profession, and the growth of a resident and working university professoriate. At the same time a change of almost equal significance has taken place in the teaching system of the university through the gradual growth of "inter-collegiate lectures." At Oxford nearly all honour lectures given by college tutors and lecturers have been thrown open to all members of the university: the college tutor is now recognized by the university as a teacher in the faculty to which he belongs, and the institution of boards of faculties has done something to bring the organization of the university into harmony with that of universities outside the British Isles.[1] At Cambridge the system of inter-collegiate lectures has also developed itself, but to a considerably smaller extent. At both the old English universities the great widening of the courses of study open to senior students (honour men), which began about the middle of the 19th century, has been continued, while there has been some widening and modernizing of the studies by which a pass or "poll" degree can be obtained. At Oxford there are now the following "Final Honour Schools": Litterae Humaniores (Classics, Ancient History and Philosophy), Mathematics, Natural Science, Jurisprudence, Modern History, Theology, Oriental Languages, English Literature; and at Cambridge there are the following "Triposes": Mathematics, Classics, Moral Sciences, Natural Sciences, Theology, Law, History, Oriental Languages, Medieval and Modern Languages, Mechanical Sciences (Engineering). Degrees in letters and science have also been instituted at both Oxford and Cambridge. The doctorate is given for original work. At Oxford the B.Litt. and B.Sc. can be taken by dissertation or original research, without passing the examination for B.A. At Cambridge the B.A. can be obtained in a similar manner by advanced students.

Further changes at Oxford and Cambridge.

The strenuous efforts of both universities fully to meet the constantly increasing requirements of scientific education have necessitated appeals for public aid which have met with much generous response. Among the latest instances is that of the late Sir W. G. Pearce, who appointed to Trinity College, Cambridge, a certain trust fund over which he had a general power of appointment, and also bequeathed to the society the residue of a considerable estate.

So long ago as the year 1640 an endeavour had been made to bring about the foundation of a northern university for the benefit of the counties remote from Oxford and Cambridge. Manchester and York both petitioned to be made the seat of the new centre. Cromwell, however, rejected both petitions, and decided in favour of Durham. Here he founded the university of Durham (1657), endowing it with the sequestered revenues of the dean and chapter of the cathedral, and entitling the society "The Mentor or Provost, Fellows and Scholars of the College of Durham, of the foundation of Oliver, &c." This scheme was cancelled at the Restoration, and not revived until the present century; but on the 4th July 1832 a bill for the foundation of a university at Durham received the royal assent, the dean and chapter being thereby empowered to appropriate an estate at South Shields for the establishment and maintenance of a university for the advancement of learning. The foundation was to be directly connected with the cathedral church, the bishop of the diocese being appointed visitor, and the dean and chapter governors; while the direct control was vested in a warden, a senate and a convocation. A college, modelled on the plan of those at the older universities, and designated University College, Durham, was founded in 1837, Bishop Hatfield's Hall in 1846, and Bishop Cosin's Hall (which no longer exists) in 1851. The university includes all the faculties, and in 1865 there was added to the faculty of arts a school of physical science, including pure and applied mathematics, chemistry, geology, mining, engineering, &c. In 1871 the corporation of the university, in conjunction with some of the leading landed proprietors in the adjacent counties, gave further extension to this design by the foundation of a college of physical science at Newcastle-upon-Tyne (subsequently designated Armstrong College), designed to teach scientific principles in their application to engineering, mining, manufactures and agriculture. Students who had passed the required examinations were made admissible as associates in physical science of the university. There is also at Newcastle the College of Medicine which stands in similar relations to Durham, of which university Codrington College, Barbados, and Fourah Bay College, Sierra Leone, are likewise affiliated colleges.

Durham.

The university of London had its origin in a movement initiated in the year 1825 by Thomas Campbell, the poet, in conjunction with Henry (afterwards Lord) Brougham, Mr (afterwards Sir) Isaac Lyon Goldsmid, Joseph Hume and some influential Dissenters, most of them connected with the congregation of Dr Cox of Hackney. The scheme was originally suggested by the fact that Dissenters were practically excluded from the older universities; but the conception, as it took shape, was distinctly non-theological. The first council, appointed December 1825, comprised names representative of nearly all the religious denominations, including (besides those above mentioned) Zachary Macaulay, George Grote, James Mill, William Tooke, Lord Dudley and Ward, Dr Olinthus Gregory, Lord Lansdowne, Lord John Russell and the duke of Norfolk. On 11th February 1826 the deed of settlement was drawn up; and in the course of the year seven acres, constituting the site of University College, were purchased, the foundation stone of the new buildings being laid by the duke of Sussex 30th April 1827. The course of instruction was designed to include "languages, mathematics, physics, the mental and the moral sciences, together with the laws of England, history and political economy, and the various branches of knowledge which are the objects of medical education." In October 1828 the college was opened as the university of London. But in the meantime a certain section of the supporters of the movement, while satisfied as to the essential soundness of the primary design as a development of national education, entertained considerable scruples as to the propriety of altogether dissociating such an institution from the national church. This feeling found expression in the foundation and

University of London.

[1] The proposed reforms initiated by Lord Curzon as chancellor of Oxford University, though largely administrative, may be mentioned here. In 1909 he issued his "Principles and Methods of University Reform." Committees of Council were formed to prepare definite schemes in the various directions indicated, and in 1910 a volume on the subject was issued to the members of Congregation. It was proposed, *inter alia*, to make Greek an optional subject in Responsions, thus foreshadowing changes in Moderations and final schools. Responsions itself was to be replaced by an entrance examination, though it has long practically served as such. The creation of "a diploma specially suitable for candidates contemplating a commercial career" was recommended. Additional provision to assist poor students, including the resignation of their emoluments by non-necessitous students in favour of exhibition funds for necessitous students in the colleges, and changes in the system of college fellowships, with especial reference to the encouragement of research in combination with tutorial work, were also indicated. Among purely administrative reforms, besides certain changes in the rules governing eligibility to the Hebdomadal Council and Congregation, it was proposed to reconstitute the method of election to and membership of the boards of faculties, at the same time creating a general board of the faculties, to control the individual boards, and to "relieve the Hebdomadal Council of the greater part of the business connected with *curricula* and examinations." A finance board was proposed to review the accounts of the university, all university institutions and colleges, and to act in an advisory and supervisory capacity.—[Ed.]

incorporation of King's College (14th August 1829), opened 8th October 1831, and designed to combine with the original plan instruction in "the doctrines and duties of Christianity, as the same are inculcated by the United Church of England and Ireland." This new phase of the movement was so far successful that in 1836 it was deemed expedient to dissociate the university of London from University College as a "teaching body," and to limit its action simply to the institution of examinations and the conferring of degrees—the college itself receiving a new charter, and being thenceforth designated as University College, London, while the rival institution was also incorporated with the university, and was thenceforth known as King's College, London. In the charter now given to the university it was stated that the king "deems it to be the duty of his royal office to hold forth to all classes and denominations of his faithful subjects, without any distinction whatsoever, an encouragement for pursuing a regular and liberal course of education." The charters of the university of London and of University College, London, were signed on the same day, 28th November 1836. In 1869 both the colleges gave their adhesion to the movement for the higher education of women which had been initiated elsewhere, and in 1880 women were for the first time admitted to degrees.

By the University of London Act 1898, and the statutes of the commissioners named therein (issued in 1900), the university of London was reconstituted. The senate is composed of the chancellor and fifty-four members, of whom four are appointed by the king in council, sixteen by the convocation (*i.e.* doctors and proctors) of the university, sixteen by the various faculties, and the remainder by various public bodies or institutions. The senate is the supreme governing body, and has three standing committees, of which one is the academic council for "internal students," another the council for "external students" and the third a board to promote the extension of university teaching. Provision is made for the appointment of professors and other teachers by the university itself, and also for the recognition as teachers of professors and others teaching in such institutions in or near London as may be recognized as schools of the university. The following bodies are constituted schools of the university: University College and King's College, London; the Royal Holloway College, Egham, Bedford College, London, and Westfield College, Hampstead (colleges for women); the Imperial College of Science and Technology; the medical schools of the principal London hospitals; the London School of Economics and Political Science; the South-Eastern Agricultural College, Wye; the Central Technical College of the City and Guilds of London Institute, and the East London College; and several theological colleges. The "appointed" and "recognized" teachers in each group of subjects form the various faculties of the university. Of these there are eight—theology, arts, law, music, medicine, science, engineering, economics and political science (including commerce and industry). Each faculty elects its dean. Courses of study are to be provided by the university for its "internal" students, *i.e.* those who pursue their studies in one of the schools of the university. Its degrees remain open to "external" students as heretofore, but separate examinations are in future to be held for "internal" and for "external" students respectively, and the senate is to "provide that the degrees conferred upon both classes of students shall represent, as far as possible, the same standard of knowledge and attainments." The whole scheme may be described as a compromise between the views of various schools of reformers—as an attempt to create a teaching university without destroying the existing purely examining university or erecting two distinct universities of London, and at the same time, without any immediate endowments, to create a university which might hereafter expand by utilizing existing institutions. One of the most important of these, King's College, it may be observed, has, without losing its connexion with the Church of England, abandoned its theological test for members of its teaching body.

The university of Manchester.

The Owens College, Manchester—so called after a wealthy citizen of that name, to whom it owed its foundation—was founded on the 12th of March 1851, for the purpose of affording to students who were unable, on the ground of expense, to resort to Oxford or Cambridge, an education of an equally high class with that given at those centres. The institution was, from the first, unsectarian in character; and, for more than a quarter of a century, students desirous of obtaining a university degree availed themselves of the examinations conducted by the university of London. In July 1877, however, a memorial was presented to the privy council petitioning for the grant of a charter whereby the college should be raised to the rank of a university with power to grant degrees. This petition having received a favourable hearing, it was at first decided that the new university should be styled the university of Manchester, and the New University College at Liverpool and the Yorkshire College at Leeds were invited to become affiliated institutions. But before the charter was issued, exception having been taken to the localization implied in the above title, it was resolved that the new institution should be styled the "Victoria University of Manchester," and under this name the university on the 20th of April 1880 received its charter. Since then, however, not only Liverpool (1881) and Leeds (1904), but the Mason University College at Birmingham (1900) and the University College at Sheffield (1905) have aspired to and attained like independence. The academic authorities at Manchester have accordingly since preferred, in other than legal documents, to revert to the original designation of the "university of Manchester."

Changes in universities of Scotland.

In Scotland the next change to be noted in connexion with the university of St Andrews is the appropriation in 1579 of the two colleges of St Salvator and St Leonard to the faculty of philosophy, and that of St Mary to theology. In 1747 an act of parliament was obtained for the union of the two former colleges into one, while in 1880 the university college at Dundee was instituted as a general school both of arts and science in similar connexion. Glasgow, in the year 1577, received a new charter, and its history from that date down to the Restoration was one of almost continuous progress. The re-establishment of episcopacy, however, involved the alienation of a considerable portion of its revenues, and the consequent suspension of several of its chairs. With the Revolution of 1689 it took a new departure, and several additional chairs were created. In 1864 the old university buildings were sold, and a government grant having been obtained, together with private subscriptions, new buildings were erected from the joint fund. By the act of 1858 important measures were passed in connexion with all the four universities. In Aberdeen, King's College and Marischal College, with their independent powers of conferring degrees, were amalgamated. In Glasgow the distribution of the "nations" was modified in order more nearly to equalize their respective numbers. The right of returning two members of parliament was bestowed on the four universities collectively —one representing Aberdeen in conjunction with Glasgow, the other Edinburgh in conjunction with St Andrews. Other important changes were enacted, which, however, became merged in turn in those resulting from the commission of 1889, whereby, after investigations extending over nearly ten years, a complete transformation was effected of both the organization and the curriculum of each university.

The government was transferred from the senatus to the courts, which were enlarged so as to include representatives from the senatus, the general councils of graduates, and the municipality within which the university is situated. In addition to these representatives, the principal, the lord rector, his assessor, the chancellor's assessor, and the lord provosts of the cities of Aberdeen, Edinburgh and Glasgow, and the provost of St Andrews have seats in the courts of their respective universities. The provost of Dundee occupies a seat in the university court of St Andrews. The lord rector is the president of the court. To the court is entrusted the management of the property and finances, and, in most cases, such patronage as does not belong to the crown; but in the case of Edinburgh, the patronage of some of the older chairs is in the hands of a body of curators. Disciplinary powers are retained by the senatus, and the general council remains, as under the act of 1858, a purely advisory body. Another advisory body—the students' representative council—was added by the commission. The curriculum of all the faculties (except divinity) was reorganized: the most important alterations consisted in the abolition of the once sacred six as compulsory subjects in arts (Latin, Greek, Mathematics, Natural Philosophy, Logic and Moral Philosophy).[1] The curriculum was greatly widened, an elaborate scheme of "options" introduced, and a new system of honours degrees was established. The length of residence required was reduced from four years to three, and the courts were empowered to institute summer sessions, and to admit women to lectures and degrees in all faculties.

There has been since the act of 1858 a great development of student life, illustrated by the institution of student's unions in all four universities, by the publication of undergraduate magazines, and by the growth, in Edinburgh, of combined residences and settlements.

Parliamentary grants to Scottish universities.

All the four universities of Scotland were aided from time to time in the last century by grants from government, and in 1905 received a material addition to their resources by the magnificent donation of £2,000,000 from Mr Carnegie.

Trinity College, Dublin.

Trinity College, Dublin, was founded in 1591, under the auspices of Sir John Perrot, the Irish viceroy. A royal charter nominated a provost and a minimum number of three fellows and three scholars as a body corporate, empowered to establish among themselves "whatever laws of either of the universities of Cambridge or Oxford they may judge to be apt and suitable; and especially that no other persons should teach or profess the liberal arts in Ireland without the queen's special licence." The first five provosts of Trinity College were all Cambridge men, and under the influence of Archbishop Loftus, the first provost, and his successors, the foundation received a strongly Puritan bias. The original statutes were mainly the work of Temple, the fourth provost, modified by Bedell, the eminent bishop of Kilmore, and the policy of Laud and Wentworth was to make the college more distinctly Anglican as regards its tone and belief. At the Restoration its condition was found to be that of a well-ordered home of learning and piety, with its estates well secured and its privileges unimpaired. Under Bishop Jeremy Taylor, who succeeded to the vice-chancellorship, its progress in learning was considerable, and the statutes underwent a further modification. Prior to the year 1873 the provostship, fellowships and foundation scholarships could be held only by members of the Church of Ireland; but all such restrictions were abolished by Act 36 Vict. c. 21, whereby the requirement of subscription to any article or formulary of faith was finally abrogated.

Queen's University.

The first departure from the above exclusive system dates from the creation of the Queen's University, incorporated by royal charter on the 3rd of September 1850. By this charter the general legislation of the university, together with its government and administration, was vested in the university senate. In 1864 the charter of 1850 was superseded by a supplementary charter, and the university reconstituted "in order to render more complete and satisfactory the courses of education to be followed by students in the colleges"; and finally, in 1880, by virtue of the act of parliament known as the University Education (Ireland) Act 1879, the Queen's University gave place to the Royal University of Ireland, which was practically a reconstitution of the former foundation, the dissolution of the Queen's University being decreed so soon as the newly constituted body should be in a position to confer degrees; at the same time all graduates of the Queen's University were recognized as graduates of the new university with corresponding degrees, and all matriculated students of the former as entitled to the same status in the latter. The university confers degrees in arts (B.A., M.A., D.Litt.), science, engineering, music, medicine, surgery, obstetrics and law. The preliminary pass examinations in arts were to be held at annually selected centres, —those chosen in 1885 being Dublin, Belfast, Carlow, Cork, Galway, Limerick and Londonderry—all honour examinations, and all examinations in other faculties, in Dublin.

Royal University of Ireland.

Colleges at Belfast, Cork, and Galway.

The Queen's Colleges at Belfast, Cork and Galway were founded in December 1845, under an act of parliament "to enable Her Majesty to endow new colleges for the advancement of learning in Ireland," and were subsequently incorporated as colleges of the university. Their professors were at the same time constituted professors in the university, and conducted the examinations. But in the reconstruction of 1880 the chief share in the conduct of the examinations and advising the senate with respect to them was vested in a board of fellows, elected by the senate in equal numbers from the non-denominational colleges and the purely Roman Catholic institutions. The colleges retained, however, their independence, being in no way subject to the control of the university senate except in the regulations with respect to the requirements for degrees and other academic distinctions.

University of Dublin.

In 1907 a scheme was projected by Mr Bryce (then chief secretary for Ireland) for reconstructing the university, whereby Trinity College was to become merged in a new "University of Dublin," in which the Queen's Colleges and a new college for Roman Catholics were also to be included. The control of the entire community was to be vested in a board, partly nominated by the crown and partly by the colleges and the general body of students. The scheme, however, was strongly opposed by the Dublin University Defence Committee on the ground that the ideals which had hitherto dominated the aims and teaching of Trinity College were incompatible with a system in which regard for the principle of authority and the repudiation of scientific theorization (as it finds expression in the *Index*) are leading features. On the other hand, the Irish bishops, while admitting the need for more efficient scientific instruction of the Catholic youth throughout their respective dioceses, declined to give support to measures whereby such students would be attracted into an atmosphere inimical to their religious faith. It was consequently next proposed by the government to establish two new universities—one in Dublin (side by side with Trinity College) and one in Belfast—in which, although no religious tests were to be enforced, it should be tacitly agreed that the former was to be the resort for Catholics, the latter for Presbyterians, Trinity College remaining, as before, the recognized Episcopalian centre. To this considerable exception was taken—the nonconformists, more especially, maintaining that such an arrangement could not fail to be prejudicial to the higher interests of the people by imparting to education a denominational bias which it was most desirable to avoid—and eventually Mr Birrell's measure was brought forward and ultimately adopted, whereby Trinity College has been left intact, but two new universities were created, one in Dublin and one in Belfast, the former involving the erection of another college (towards the expense of which the government was pledged to contribute) and the incorporation of the Queen's Colleges at Cork and Galway; while the college in Belfast was to form the nucleus of the second university. In order further to ensure their representative character, the new university of Dublin had a nominated senate of 36 members, of whom all but seven were to be Roman Catholics; that of Belfast had a similar body, of whom all but one were to be Protestants. In all these new centres there were to be no religious tests either for professors or students. On the other hand, the obligation formerly imposed of a preliminary course of study at one or other of the colleges before admission to degrees had been abolished at the foundation of the Royal University, the examinations being now open,

[1] At Edinburgh there was a *seventh*, viz. rhetoric and English literature.

like those of the university of London, to all matriculated students on payment of certain fees.

Wales. The university of Wales, which received the royal charter in 1893, incorporated three earlier foundations—the university colleges of Aberystwyth, Bangor and Cardiff. St David's College at Lampeter was founded in 1822 for the purpose of educating clergymen in the principles of the established Church of England and Wales, mainly for the supply of the Welsh dioceses, but, although affiliated to both Oxford and Cambridge, retained its independence and also the right of conferring the degrees of bachelor of arts and of divinity. Bangor in North Wales, on the other hand, which received its charter in 1885, is designed to "provide instruction in all the branches of a liberal education except theology."

India. In India the three older universities all date from 1857—that of Calcutta having been incorporated January 24, Bombay July 18, Madras September 5, in that year. At these three universities the instruction is mainly in English. "A university in India is a body for examining candidates for degrees, and for conferring degrees. It has the power of prescribing text-books, standards of instruction, and rules of procedure, but is not an institution for teaching. Its governance and management are vested in a body of fellows, some of whom are *ex officio*, being the chief European functionaries of the state. The remainder are appointed by the Government, being generally chosen as representative men in respect of eminent learning, scientific attainment, official position, social status or personal worth. Being a mixed body of Europeans and natives, they thus comprise all that is best and wisest in that division of the empire to which the university belongs, and fairly represent most of the phases of thought and philosophic tendencies observable in the country. The fellows in their corporate capacity form the senate. The affairs of the university are conducted by the syndicate, consisting of a limited number of members elected from among the fellows. The faculties comprise arts and philosophy, law, medicine and civil engineering. A degree in natural and physical science has more recently been added" (Sir R. Temple, *India in 1880*, p. 145). The Punjab University was incorporated in 1883—the Punjab University College, prior to that date, having conferred titles only and not degrees. The main object of this university is the encouragement of the study of the Oriental languages and literature, and the rendering accessible to native students the results of European scientific teaching through the medium of their own vernacular. The Oriental faculty is here the oldest, and the degree of B.O.L. (bachelor of Oriental literature) is given as the result of its examinations. At the Oriental College the instruction is given wholly in the native languages, and the success of the institution was sufficiently demonstrated before the close of the 19th century by the fact that twelve centres of instruction at Lahore and elsewhere had been affiliated. The university of Allahabad was founded in 1887 as an examining university for the united provinces of Agra and Oudh. In 1887 the senate at Cambridge (mainly on the representations of Mr C. P. Ilbert, formerly vice-chancellor of the university of Calcutta) adopted resolutions whereby some forty-nine collegiate institutions already affiliated to the latter body were affiliated to the university of Cambridge, their students becoming entitled to the remission of one year in the requirements with respect to residence at Cambridge.

Australasia. In Australia the university of Sydney was incorporated by an act of the colonial legislature which received the royal assent 9th December 1851, and on 27th February 1858 a royal charter was granted conferring on graduates of the university the same rank, style and precedence as are enjoyed by graduates of universities within the United Kingdom. Sydney is also one of the institutions associated with the university of London from which certificates of having received a due course of instruction may be received with a view to admission to degrees. The design of the university is to supply the means of a liberal education to all orders and denominations, without any distinction whatever. An act for the purpose of facilitating the erection of colleges in connexion with different religious bodies was, however, passed by the legislature during the session of 1884, and since that time colleges representing the Episcopalian, Presbyterian and Roman Catholic Churches have been founded. In the same year women were first admitted to degrees, and subsequently became an appreciable element, numbering before the close of the 19th century one-fifth of the entire number of students. The university of Melbourne, in the state of Victoria, was incorporated and endowed by royal act on the 22nd of January 1853. This act was amended on the 7th of June 1881. Here also no religious tests are imposed on admission to any degree or election to any office. The council is empowered, after due examination, to confer degrees in all the faculties (excepting divinity) which can be conferred in any university within the British dominions. It is also authorized to affiliate colleges; and Trinity College (Church of England), Ormond College (Presbyterian) and Queen's College (Methodist) were all established in the 19th century. The university of Adelaide in South Australia (founded mainly by the exertions and munificence of Sir Walter Watson Hughes) was incorporated by an act of the colonial legislature in 1874, in which year it was further endowed by Sir Thomas Elder. In 1881 degrees conferred by the university were constituted of equal validity with those of any university of the United Kingdom. The university of Tasmania at Hobart was founded in 1890 by act of parliament as a state university with an annual grant, and was subsequently affiliated both to Oxford and Cambridge.

The university of New Zealand, founded in 1870, and reconstituted in 1874 and 1875, was empowered by royal charter to grant the several degrees of bachelor and master of arts, and bachelor and doctor in law, medicine and music. Women have since been made admissible to degrees. To this university, University College at Auckland, Canterbury College at Christchurch, and the university of Otago at Dunedin have successively been admitted into connexion as affiliated institutions, while the university of New Zealand itself has become affiliated to that of Cambridge. Otago was founded in 1869 by an order of the provincial council, with the power of conferring degrees in arts, medicine and law, and received as an endowment 100,000 acres of pastoral land. It was opened in 1871 with a staff of three professors, all in the faculty of arts. In 1872 the provincial council further subsidized it by a grant of a second 100,000 acres of land, and the university was thereby enabled to establish a lectureship in law, and to lay the foundations of a medical school. In 1874 an agreement was made between the university of New Zealand and that of Otago, whereby the functions of the former were restricted to the examination of candidates for matriculation, for scholarships and for degrees; while the latter bound itself to become affiliated to the university of New Zealand and to hold in abeyance its power of granting degrees. As the result of this arrangement, the university of Otago became possessed of 10,000 acres of land which had been set apart for university purposes in the former province of Southland. In 1877 a school of mines was established in connexion with the university.

Canada. Prior to the union of the two provinces of Lower and Upper Canada, the M'Gill College and University in the former province had been instituted in Montreal by royal charter in 1821, on the foundation of the Honourable James M'Gill, who died in that city on the 19th of December 1813. It was designed to be Protestant but undenominational. With this a group of colleges in the same province—the Stanstead Wesleyan, Vancouver, Victoria, and King's—have since become associated as affiliated institutions, as also have the four Protestant colleges in Montreal itself, such affiliation, however, extending no further than the examinations in the faculty of arts. Into similar relation the Université Laval in Quebec, founded as a Catholic university in 1852, was admitted in 1878. Notwithstanding the difficulties presented by divergencies of race, Montreal has prospered during the chancellorship of Lord Strathcona, and numbers over 1100 students. The university of Toronto in Upper Canada, or Ontario, was originally established by royal charter in 1827, under the title of King's College, with certain religious restrictions, but in 1834 these restrictions were abolished. In 1849 the designation of the university was changed into that of the university of Toronto, and the faculty of divinity was abolished. In 1853 the university was constituted with two corporations, "the university of Toronto" and "University College," the latter being restricted to the teaching of subjects in the faculty of arts. In 1873 further amendments were made in the constitution of the university. The chancellor was made elective for a period of three years by convocation, which was at the same time reorganized so as to include all graduates in law, medicine and surgery, all masters of arts, and bachelors of arts of three years' standing, all doctors of science, and bachelors of science of three years' standing. The powers of the senate were also extended to all branches of literature, science and the arts, to granting certificates of proficiency to women, and to affiliating colleges. The whole work of instruction was now assigned to University College, which is maintained out of the endowment of the provincial university, and governed by a council composed of the residents and the professors. Its several chairs include classical literature, logic and rhetoric, mathematics and natural philosophy, chemistry and experimental philosophy, history and English literature, mineralogy and geology, metaphysics and ethics, meteorology and natural history, and lectureships on Oriental literature, German and French. Trinity College, in the same university, is the Church of England college, founded in 1852 in consequence of the above-mentioned suppression of the theological faculty. Other universities and colleges with power to confer degrees are the Dalhousie College at Halifax, which obtained the rights of a university in 1841 and was subsequently organized as such in 1863, with the governor of Nova Scotia as supreme authority; the Victoria University at Cobourg (1836), supported by the Methodist Church of Canada; Queen's University, Kingston (1841).

In South America the beginning of the "national university" of Buenos Aires may be assigned (in the absence of any charter) to about the year 1890. Before the close of the century it had become a flourishing school of law, medicine and the exact sciences, with professors in all the faculties and considerably over 2000 students. Monte Video in Uruguay had its origin in a faculty of medicine established in 1876, with courses of study extending over six years. It is here imperative when the diploma is taken by those who are not natives that it should be attested by the consul of their own country. Faculties of law and mathematics were subsequently created, and also a faculty of preparatory studies corresponding with the gymnasium or *Realschule* of Germany. The new "national university of La Plata" has recently (1905–1908) been opened in the city of that name, under the auspices of the university of Philadelphia. It claims to be the exponent of the most advanced theories in relation to subjects and methods of instruction and to university extension. In the north of the continent the academy at Caracas is little more than a branch of the royal Spanish academy for education in the Spanish language, and is subsidized by the Venezuelan government.

South America.

The university of the Cape of Good Hope (see CAPE COLONY) grants degrees, but is not a teaching institution. An inter-state commission, appointed in 1907, recommended the establishment of a Federal University for South Africa with constituent colleges. While the colleges would possess freedom in management and teaching, it was recommended that the university should test all candidates seeking admission to the colleges and for the final examinations for degrees, &c. At the opening of the first Union parliament in November 1910 the ministry announced that a scheme for a national South African University would be submitted. It was also announced that the Beit bequest of £200,000 for a university at Johannesburg (*q.v.*) would be diverted towards the creation of a teaching university at Groote Schuur, and that Sir Julius Wernher would make a donation towards it of £300,000.

South Africa.

In 1903 a highly influential conference was held at Burlington House to promote closer relations between British and colonial universities, the sittings being presided over by Mr Bryce, Lord Strathcona and Sir Gilbert Parker. The conference held that Great Britain should help the colonial universities to co-operate one with another, and increase their own efficiency by combination and specialization. (J. B. M.)

Universities in the United States.

In the United States the word "university" has been applied to institutions of the most diverse character, and it is only since 1880 or thereabouts that an effort has been seriously made to distinguish between collegiate and university instruction; nor has that effort yet completely succeeded. Harvard, William and Mary, and Yale, the three pioneers of colonial times, were organized in the days of colonial poverty, on the plans of the English colleges which constitute the universities of Oxford and Cambridge. Graduates of Harvard and Yale carried these British traditions to other places, and similar colleges grew up in New York, New Jersey, Pennsylvania, New Hampshire and Rhode Island, and later in many other states. The underlying principle in these institutions was discipline—mental, moral and religious. Dormitories and commons were provided, and attendance upon religious worship in the chapel was enforced. Harvard and Yale were the children of the Congregational churches, Columbia was fostered by the Episcopalians, Princeton by the Presbyterians, Rutgers by the Dutch Reformed and Brown by the Baptists. Around or near these nuclei, during the course of the 19th century, one or more professional schools were frequently attached, and so the word "university" was naturally applied to a group of schools associated more or less closely with a central school or "college." Harvard, for example, most comprehensive of all, has seventeen distinct departments, and Yale has almost as many. Columbia and Pennsylvania have a similar scope. In the latter part of the 19th century Yale, Columbia, Princeton and Brown, in recognition of their enlargement, formally changed their titles from colleges to universities. The ecclesiastical, or religious, note was a strong characteristic of these foundations. Protestant evangelical doctrines were taught with authority, especially among the undergraduates, who were spoken of as constituting "the college proper." In the oldest and largest colleges this denominational influence has ceased to have the importance it once possessed.

Origins.

Noteworthy innovations came when Thomas Jefferson, the philosophical statesman, returned to the United States from France, emancipated from some of the narrow views by which his countrymen were bound. He led the Virginians to establish, on a new plan, the university of Virginia as a child of the state; and the freshness of his advice, the importation of distinguished foreign teachers, and the freedom of the student from an enforced curriculum awakened admiration and emulation on the one hand, and animadversion on the other. But this university unquestionably led to broad conceptions of academic work, which appeared foreign and even questionable, if not irreligious, to the colonial universities already mentioned, although many of the features which were then regarded as doubtful peculiarities are now familiar everywhere. Following Virginia's example, many of the new states in the West established state universities, most of which included a central college of the colonial type and afterwards one or more professional schools. Freedom from ecclesiastical control is found in all the foundations that make up this second group—the state universities. Michigan, Wisconsin, Minnesota and California present distinguished examples of such organizations. In earlier days, Maryland, North and South Carolina, Georgia and other states of the South had anticipated in a limited way the state support of higher education which was made so conspicuous in Virginia. In their plans of education, intellectual and moral, they adhered closely to the college methods which the Northern institutions had introduced from English antecedents. Since 1865 another class of universities has arisen, quite distinct from the colonial establishments and from the wards of the state. These are independent foundations due to individual generosity. The gifts of Cornell, Johns Hopkins, Rockefeller (University of Chicago), Tulane, De Pauw, Clark and Leland Stanford have brought into being universities which have no dependence upon state control,[1] and when a denominational character is assured this fact is not made prominent.

Thus, looking at their origin, we see three impulses given to American high schools, from churches, states and individuals. It is true that all receive from the state some degree of authority as incorporations, but this authority is so easily obtained that in a single city there may be, and in some places there are, several incorporations authorized to bestow degrees and to bear the name of universities. A foreigner cannot understand nor can an American justify this anomaly. The most that can be said for it is that there is complete freedom of organization, and that the best, and only the best, are likely to survive. Another influence, proceeding from the national government, must also be borne in mind. During the Civil War, Congress, led by Senator Morrill of Vermont, bestowed upon every state a certain portion of the public domain in the Far West—"land-scrip," as it was called—the proceeds of its sale to be devoted to the establishment and maintenance of one or more colleges in each state, where instruction should be given in agriculture and the mechanic arts, not excluding liberal studies, and including military tactics. In some states this bounty was directed to existing universities. New departments were organized in old institutions. Elsewhere new institutions were created. While all these schools were regarded as practical and technical at the first, most of them as they developed became liberal and scientific; and when Congress made later large appropriations for "experiment stations" in the sciences relating to agriculture, an impulse of the most valuable character was given to many departments of scientific research.

This sketch would not be complete without the mention of two foundations, each unique. The Catholic University in Washington has been created by the pope, and in its government the hierarchy of the Roman Catholic Church is made dominant. Already the Roman Catholics had established, especially under the charge of the Jesuit fathers and of the Sulpicians, excellent colleges for liberal education, as well as schools of theology; but the newer metropolitan university was distinctly organized on a broader plan, in closer accordance with the universities of continental Europe, and with a pronounced recognition of the importance of science. The university of the State of New York is a supervisory (not a teaching)

[1] Cornell, however, received New York's share of the Congressional land grant of 1862, and the state is represented on its board of trustees. See CORNELL UNIVERSITY.

body exercising a general control over all the schools of higher instruction in the state, and especially guarding the conditions upon which degrees are conferred.

The interior organization of these institutions may now be considered. Some of them have but one department, the philosophical, which includes the liberal arts and sciences; others have two, three or many correlated departments. Clark University, for example, has but one faculty, the philosophical; Harvard, as already stated, has many departments, including philosophy, law, medicine and theology. So has Yale. Princeton has four. Johns Hopkins has two, the philosophical and the medical. In most American universities a sharp distinction is made between undergraduates and graduates, between those who are candidates for the baccalaureate degree (A.B., S.B., and Ph.B.) and those who are engaged in higher professional study, like law, medicine and theology, or in the manifold branches of modern science, like philology, historical and political science (including economics), philosophy (including logic, ethics and psychology), mathematics, physics, chemistry, biology, geology, &c. In certain places, as at Johns Hopkins, since 1876, emphasis is given to the idea that college instruction is disciplinary, requiring definite, but not uniform methods, and a certain deference to the authority of a master; while university instruction is much freer, and the scholar is encouraged to inquire rather than to accept; to test and observe rather than to hear and recite; to walk with a friendly guide rather than to obey a commander. This distinction is not universally recognized. Indeed, it has been made but recently in American institutions, so that older men are often heard asking, "What is the difference between a college and a university?" But generally it is admitted that college training is one thing, and work in a university is another; that thorough instruction in language, history, mathematics, natural and physical sciences, and in morals, should precede the discipline of professional schools and the pursuit of the higher and more advanced studies in letters and science. In a complete university provision should be made, according to ancient and widespread usages, for the study of law, medicine and theology; but unfortunately the development of such schools in the United States has been fettered by narrow conditions. The schools of theology, with rare exceptions, are under denominational control; and so established is this usage, that in the state universities, and in most of the private foundations (Chicago being an exception), theological departments are not encouraged, because of the dread of religious rivalries and dogmatism. Until recently there have been no endowments for medical schools to any adequate extent, and consequently the fees paid by students have been distributed among the teachers, who have usually been the real managers of the institution, although acting under the name of some university. It is nearly the same in law. There are many indications that changes are at hand in these particulars. Theological schools make their denominational characteristics less pronounced, and the old colleges no longer speak of the schools of law and medicine as "outside" departments. The rapid growth of the physical and natural sciences during the 19th century, and the extension of scientific methods of inquiry and verification to subjects which were formerly taught by the traditional methods of authority, have led to the development of laboratories and libraries. Everywhere special buildings, well equipped with the latest and best apparatus, are springing up, where the students of chemistry, physics, biology (in its numerous subdepartments—bacteriology among them) and electricity have every facility for study and research. The introduction of laboratories for psychology is specially noteworthy. Pathological laboratories have become essential in schools of medicine.

Organization.

Professional schools.

Libraries are—as they always have been and always will be—storehouses where the books and manuscripts of the past are preserved; but in American universities they have taken on another characteristic. Subdivided into special departments, or supplemented by fresh additions, they are the working-rooms of "seminaries," where capable teachers, surrounded by scholars properly qualified, are engaged in teaching, studying and writing. Seminaries and laboratories distinguish the modern philosophical departments from those of old, where the lecture-room was the seat of instruction. Numerous memoirs and monographs proceed from this active life. Books, periodicals and dissertations are contributions to the advancement of knowledge. Two agencies have effected these changes, most of which are the product of the last quarter of the 19th century. In the first place, gifts for higher education have been munificent, sometimes, especially in the East, from private citizens—often, especially in the West, from the treasuries of separate states. Quite as important has been the growth of liberal ideas. Very many of the foremost professors in American universities are the scholars of European teachers, especially Germans. Candidates for professorships are resuming the usages which prevailed early in the 19th century, of studying in France and Great Britain. On their return it is essential that they should keep themselves familiar with the latest literature in their departments, whatsoever may be the language in which it appears. Hence the American universities are no longer provincial. They must be judged, for better or for worse, by the standard of universities established in Europe. The bestowal of academic degrees ought to be strictly governed by some recognized authority, and according to ancient usages it is one of the highest functions of a university. In the United States there is but little restraint proceeding from law, tradition or public opinion. Every "college" is at liberty to exercise this privilege. Hence the variety of academic titles that have been introduced; hence, also, occasional and scandalous frauds in the issue of diplomas. The best institutions exercise due diligence; the public may be protected by requiring that every one who claims the privileges of his degree, or who appends to his name the usual abbreviations indicative of professional or academic authority, should make it clear where, when and how he received his title.

The institutions in the United States which claim to be universities, in the world-wide use of that designation, recognize these principles and, so far as their means allow, adhere to these methods: 1. There is a disciplinary stage in education which is the requisite introduction to the higher and freer work of the university. This is the sphere of the colleges. 2. The success of the higher work depends upon the intellectual and moral qualities of the professors. No amount of material prosperity is of value unless the dominant authorities are able to discover, secure and retain as teachers men of rare gifts, resolute will, superior training and an indomitable love of learning. 3. The professors in a university should be free from all pecuniary anxiety, so that their lives may be consecrated to their several callings. Pensions should be given them in cases of disability, and, in case of premature death, to their families. In methods of instruction they should have as large an amount of freedom as may be consistent with due regard for the co-operation of their colleagues and the plans of the foundation. 4. The steady improvement of the libraries and laboratories is essential if the institution is to keep in the front line. The newest books and the best apparatus are indispensable, for instruments and books quickly deteriorate and must be superseded. 5. For all these outlays large endowments are required. To a considerable extent reliance must be placed on wealthy and public-spirited citizens. In order to enlist such support, the members of a faculty should manifest their interest in public affairs, and by books, lectures and addresses should inform the public and interest them in the progress of knowledge. 6. Publication is one of the duties of a professor. He owes it not only to his reputation but also to his science, to his colleagues, to the public, to put together and set forth, for the information and criticism of the world, the results of his inquiries, discoveries, reflections and investigations. Qualified students should also be encouraged, under his guidance, to print and publish their dissertations.

College improvements.

Closely associated with the development of the university idea since 1875 is the improvement of the American college. Complaints are often made that the number of colleges is too large, and it is undoubtedly true that some institutions, inferior to city high schools, have usurped the names, the forms and some of the functions that should be restricted to establishments with larger endowments and better facilities for the promotion of scholarship; but while this is admitted, the great benefits which have resulted from the recognition, far and wide over the vast domain of the United States, of the value of higher education must not be forgotten. The support of churches of every name and the gifts of states, cities and private citizens, have been everywhere enlisted in behalf of learning. In every college worthy of the name, mathematics, ancient and modern languages, and the elements at least of modern science, are taught. More or less choice is permitted in the courses requisite to a bachelor's degree. Moral and religious influences are brought to bear on the formation of character. All this is favourable to the enlightenment of the people, and excuses, if it does not justify, the multiplication which is so often deprecated. The establishment of colleges for women, fully equal to the colleges for men, and in many places the admission of women to colleges and universities not originally intended for women, is one of the most noteworthy of the advances in higher education. Opinions are still divided in respect of the widsom of co-education, especially in the undergraduate period, but there is no longer any question as to the wisdom of giving to women the very best opportunities for intellectual culture; while the success that women have shown in the pursuit of many branches of science has led in many universities to their admission to the established laboratories and lecture-rooms. Separate colleges for women are now maintained in close connexion with Harvard, Columbia, Tulane and other institutions, and this mode of procedure seems likely to be introduced elsewhere. At the same time, independent foundations like Vassar, Smith, Wellesley, Bryn Mawr and Goucher are supported with so much vigour, and with such able faculties, that it is not easy to say which organization is the best, and indeed there is no occasion to raise the question. In the Western universities generally, as in Michigan, Wisconsin, California, Chicago, &c., women are admitted to all courses on the same terms as men. (D. C. G.)

AUTHORITIES.—On the earlier history and organization of the medieval universities, the student should consult F. C. von Savigny, *Gesch. d. römischen Rechts im Mittelalter* (7 vols., 1826–51); for the university of Paris, Du Boulay, *Historia Universitatis Parisiensis* (6 vols., Paris, 1665); Crevier, *Hist. de l'université de Paris* (7 vols., Paris, 1761); and C. Jourdain, *Hist. de l'université de Paris au XVIIe et au XVIIIe siècle* (Paris, 1862), and also articles on special points in the same writer's *Excursions historiques* (1888).

The work of Du Boulay (Bulaeus) is one of great research and labour, but wanting in critical judgment, while that of Crevier is little more than a readable outline drawn from the former. The views of Du Boulay have been challenged on many important points by P. H. Denifle in the first volume of his *Die Universitäten des Mittelalters bis 1400* (1885), and more particularly on those relating to the organization of the early universities. The results of Denifle's researches have been largely incorporated in Mr Rashdall's *Universities of Europe in the Middle Ages* (2 vols., Oxford, 1895), especially in connexion with the *origines* of Paris, Oxford and Cambridge; and the earlier works of Meiners, *Gesch. d. Entstehung und Entwickelung der hohen Schulen* (4 vols., 1802–5); and T. A. Huber, *Die englischen Universitäten* (Cassel, 1839–40), translation by F. W. Newman (3 vols., 1845), are thus to a great extent superseded. Much useful criticism on the comparative merits of the German and the English universities prior to the 19th century is to be found in the *Discussions* (1853) of Sir W. Hamilton. For the German universities exclusively, Zarncke's *Die deutschen Universitäten im Mittelalter* (Leipzig, 1857); Heinrich von Sybel, *Die deutschen Universitäten* (2nd ed., 1874); and Georg Kaufmann's *Gesch. der deutschen Universitäten* (2 vols.), are indispensable. Of the latter, vol. i. (1888) treats of the *origines*; vol. ii. (1896) carries the subject to the end of the middle ages, dealing generally with the history of academic institutions rather than the details of separate universities. Georg Voigt's *Die Wiederbelebung des classischen Alterthums* (2 vols., 1880–81) throws much light on the history of both Italian and German scholarship at the time of the Renaissance, and supplies a useful bibliography. The work of Professor Friedrich Paulsen, *Gesch. d. gelehrten Unterrichts auf den deutschen Schulen und Universitäten* (2nd ed., 2 vols., 1906; English translation by M. E. Sadler, London, 1906), is a masterly survey of the whole modern period down to the close of last century. Tholuck, *Das academische Leben des 17 Jahrhunderts* (2 vols., Halle, 1853–54); Dolch, *Gesch. des deutschen Studententhums* (1858); J. Conrad, *The German Universities for the Last Fifty Years*, translated by Hutchinson, preface by Bryce (Glasgow, 1885); T. Ziegler, *Der deutsche Student am Ende des 19 Jahrhunderts* (Stuttgart, 1895), all deal with special periods. Adolf Harnack, *Geschichte der königlich-preussischen Academie der Wissenschaften zu Berlin* (4 vols., 1900), is also of high value, the first two volumes for the medieval, the latter two for the modern period. To these may be added, as useful for reference, the *Geschichte der Erziehung vom Anfang an bis auf unsere Zeit* (Stuttgart, 1896–1901), by Dr K. A. and Georg Schmidt, containing critical bibliographies at the beginning of each chapter; while the *Bibliographie der deutschen Universitäten* by Wilhelm Erman and Ewald Horn (3 vols., Leipzig, 1904–6) is most complete for the literature of the entire subject down to the close of last century. For a comparative estimate of the history of the different faculties, *Die Universität Giessen von 1607 bis 1907* (2 vols., Giessen, 1907) is highly suggestive. The *Monumenta Germaniae Paedagogica* (20 vols., 1886–1900), though relating mainly to schools, often supplies valuable illustrative matter.

The statutes of the French universities, so far as ascertainable, have been edited by Fournier, *Statutes et privilèges des universités françaises* (1890); the *Chartularium* of the university of Paris, as edited by Denifle and Chatelain (4 vols., Paris, 1889–97), coming down to 1452. Works dealing with later history are Gréard, *Nos adieux à la vieille Sorbonne* (Paris, 1893); H. Schön, *Die französischen Hochschulen seit der Revolution* (Munich, 1896); L. Liard, *L'Enseignement supérieur en France, 1789–1894* (2 vols., Paris, 1894); Joseph Prost, *La Philosophie à l'académie protestante de Saumur, 1606–1685* (Paris, 1907).

For Italy, the *origines* of Bologna are dealt with by Chiapelli, *Lo Studio Bolognese* (Pistoia, 1888); Fitting, *Die Anfänge der Rechtsschule zu Bologna* (Bologna and Leipzig, 1888); Ricci, *I primordi d. Studio di Bologna* (2nd ed., Bologna, 1888). All the extant statutes are edited by Carlo Malagola, *Statuti d. univ. e dei collegi d. studio bolognese* (Bologna, 1888); and a new edition has appeared of the learned C. J. Sarti's *De claris Archigymnasii Bononiensis Professoribus* (Bologna, 1888, &c.). In connexion with Padua we have *Die Statuten der Juristen-Universität Padua vom Jahre 1331*, ed. H. Denifle, a reprint from the *Archiv*. For Spain, the work of De La Fuente (Madrid, 1855) gives a concise summary of the main facts in the growth of the universities and also of the other institutions for public instruction throughout the country; the *Libro Memoria*, by Solier and Vilches (1895) gives the necessary information down to a later period, in connexion with the central institution in Madrid. The history of the faculty of theology at the Portuguese university of Coimbra has been recorded on a more elaborate scale by Dr Manuel Eduardo da Motta Veiga (Coimbra, 1872). The *Universidades y Colegios* of Dr Joaquin v. González (Buenos Aires, 1907) contains an interesting account of the new university movement in Argentina. For Oxford there are the laborious collections by Anthony Wood, *History and Antiquities of the University and of the Colleges and Halls of Oxford*, edited with continuation by Rev. J. Gutch (5 vols., 1786–96), and *Athenae* and *Fasti Oxonienses*, edited by Dr P. Bliss (4 vols., 1813–20); *A History of the University of Oxford from the Earliest Times to 1530*, by H. C. Maxwell Lyte (1886); and *Statutes of the University of Oxford compiled in 1636 under Authority of Archbishop Laud*, ed. Griffiths (Oxford, 1888). The publications of the late Joseph Foster, *Alumni Oxonienses, 1500–1886* (8 vols.), supply the facts that are contained in the registers relating to the academic careers of graduates; his *Oxford Men and their Colleges, 1880–92* (2 vols., 1893) contains, vol. i., college life and antiquities, with illustrations; vol. ii., completion of *Alumni* and *Matriculation Register, 1880–92*. The publications of the Oxford Historical Society include some valuable histories of separate colleges, that of Pembroke (by Macleane), Corpus Christi (by Fowler), Merton (by Brodrick); also Anthony Wood's *Life and Times*, ed. Rev. Andrew Clark (4 vols.); Hearne's *Collections*, ed. Doble and Rannie (4 vols.); and *Early Oxford Press* (to 1640), by Falconer Madan. The series of *College Histories*, originally published by F. E. Robinson (now by Hutchinson & Co.), is often serviceable both to the historian and the biographer. For Cambridge, the researches of C. H. Cooper, greatly surpassing those of Wood in thoroughness and impartiality, are comprised in three series: (1) *Annals of Cambridge* (5 vols., 1842–1908); (2) *Athenae Cantabrigienses, 1500–1609* (2 vols., 1858–61); (3) *Memorials of Cambridge* (3 vols.; new ed. 1884). The *Architectural History of the University of Cambridge and of the Colleges*, by the late Robert Willis, edited and continued by J. Willis Clark (4 vols., 1886), is a work of admirable thoroughness and completeness. The *Grace Books*, in 3 vols., down to 1526, have been carefully edited and published by the University Press. J. B. Mullinger, *History of the University of Cambridge from the Earliest Times to Accession of Charles I.* (2 vols., 1873–85), vol. 3 at press, and *Cambridge Described and Illustrated*, by T. D. Atkinson and J. W. Clark (1897), deal chiefly with the course of education and learning, and with the antiquities respectively. To these may be added Thomas Baker's *History of the College of St John the Evangelist*, edited by Professor Mayor (2 vols., 1869); also, by same editor, *Admissions to St John's* (3 vols., 1630–1765); and *Records* of same society (2 series), edited by R. F. Scott—all three works being valuable aids both to the biography and history of contemporary times. Equally so is Dr Venn's excellent *Biographical History of Caius College* (3 vols., 1897–1901). Mr J. A. Venn's *Statistical Chart*, exhibiting conjointly the *Matriculation Statistics* at both universities from 1544 to 1906, has been reproduced, along with an explanatory article, in the *Oxford and Cambridge Review* for Lent term, 1908, and a similar chart for the colleges (in Cambridge) has been

published by the same editor. For both universities see the *Documents* issued by the Oxford and Cambridge Commissions of 1858.

Mr M. E. Sadler's *Special Report to the Education Office on the Admission of Women to the Universities* is the most authoritative source of information on the subject. Of the existing endowments, faculties and professoriate of universities throughout the world, the serial entitled *Minerva*, edited by Dr K. Trübner (Trübner, Strassburg), has supplied trustworthy particulars since its first publication in 1891, together with concise information and references to original sources respecting the origin and history of the universities themselves. (J. B. M.)

Academic Hoods

1. *Great Britain and Ireland*

Aberdeen.—D.D., scarlet cloth, lined purple; B.D., black,[1] lined purple; LL.D., scarlet cloth, lined pale blue; LL.B., black, bordered pale blue; M.D., scarlet cloth, lined crimson; M.B., black, lined crimson; D.Litt., scarlet cloth, lined white; D.Phil., scarlet cloth, lined white; D.Sc., scarlet cloth, lined green; B.Sc., black, lined green; M.A., black, lined white.

Cambridge.—D.D., scarlet cloth, lined pink and violet shot, with loops of black cord; B.D., black, unlined; LL.M., black, lined white; LL.D., scarlet cloth, lined pink; LL.B., black silk or stuff, edged white fur; M.D. scarlet cloth, lined dark cherry colour; M.B., black, lined dark cherry colour; Mus.D., cream damask, lined cherry colour; Mus.B., dark cherry colour, lined white fur; Litt.D., scarlet cloth, lined scarlet; D.Sc., scarlet cloth, lined pink and light blue shot; M.A., black, lined white; B.A., black stuff or silk, edged white fur. Proctors as their Congregation habit wear the ruff and black and white hood; on other occasions they wear the hood "squared."

Dublin.—(The hoods are the same for the Royal University, except M.B., Mus.D. and divinity degrees, which it does not grant.) D.D., scarlet cloth, lined black; B.D., black, unlined; LL.D., scarlet cloth, lined pink; LL.B., black, bordered white; M.D., scarlet cloth, lined scarlet; M.B., black, lined white fur (Royal University, black, bordered scarlet); Mus.D., crimson cloth, lined white (Royal University, white damask, faced and lined rose satin); Mus.B., blue, lined white fur (rabbit-skin); Litt.D., scarlet cloth, lined white; D.Sc., scarlet cloth, lined blue; M.A., black, lined blue; B.A., black, edged white fur; Proctor, black silk, lined "ermine."

Durham.—D.D., scarlet "cassimere," lined "palatinate purple"; B.D., black, unlined; D.C.L., scarlet cassimere, lined white; B.C.L., palatinate purple, edged white fur; M.D., scarlet cassimere, lined scarlet, bordered palatinate purple; M.B., scarlet silk, lined palatinate purple, edged white fur; Mus.D., white brocade, lined palatinate purple; Mus.B., palatinate purple, edged white fur; Litt.D., scarlet cassimere, lined old-gold satin; Litt.B., old-gold satin, edged white fur; D.Sc., palatinate purple cassimere, lined scarlet; B.Sc., palatinate purple, edged white fur; M.A., black, lined palatinate purple; B.A., black stuff or silk, edged white fur.

Edinburgh.—D.D., black cloth, lined purple; B.D., black silk, lined purple, edged white fur; LL.D., black cloth, lined blue; LL.B., black silk, lined blue, edged white fur; B.L., black, bordered blue, edged white fur; M.D., black cloth, with cape attached, lined and faced crimson silk; M.B., black, lined crimson, edged white fur; Mus.D., scarlet cloth, lined white corded silk; Mus.B., scarlet silk, lined white, edged white fur; Litt.D., black cloth, lined royal blue shot with maize; D.Phil., black cloth, lined white, shot with "Vesuvius"; D.Sc., black cloth, lined green; B.Sc., black silk, lined green, edged white fur; M.A., black silk, lined white.

Glasgow.—D.D., scarlet cloth, lined white; B.D., black, lined light cherry colour, bordered scarlet cloth; LL.D., scarlet cloth, lined Venetian red; LL.B., black, lined Venetian red, bordered scarlet cloth; B.L., black, bordered Venetian red; M.D., scarlet cloth, lined scarlet; M.B., black, lined scarlet, bordered scarlet cloth; D.Sc., scarlet cloth, lined gold colour; B.Sc., black, lined gold colour, bordered scarlet cloth; M.A., black silk, lined "bell-heather" colour (purplish red); B.A., black silk or stuff, bordered bell-heather red.

London.—(Bachelors, if members of Convocation, have their hoods lined white silk, bordered with the colour of their faculty.) D.D., scarlet cloth, lined "sarum red"; B.D., black, bordered sarum red; LL.D., scarlet cloth, lined blue; LL.B., black, bordered blue; M.D., scarlet cloth, lined violet; M.B., and B.S., black, bordered violet; Mus.D., scarlet cloth, lined white, if a member of Convocation, if not, same as Mus.B., blue, lined white, watered silk; Litt.D., scarlet cloth, lined russet; D.Sc., scarlet cloth, lined gold colour; B.Sc., black, bordered gold colour; M.A., black, lined russet; B.A., black, bordered russet.

Oxford.—D.D., scarlet cloth, lined black; B.D., black, unlined; D.C.L., scarlet cloth, lined rose; B.C.L., light blue, edged white fur; M.D., scarlet cloth, lined rose; M.B., dark blue, edged white fur; Mus.D., white damask, lined crimson; Mus.B., light blue, edged white fur; Litt.D., scarlet cloth, lined slate colour; Litt.B., light blue, edged white fur; M.A., black, lined red; B.A., black silk or stuff, edged white fur; Proctors wear a "miniver" hood.

[1] Where not otherwise stated, the hood is of silk.

St Andrews.—D.D., violet silk or cloth, lined white satin; B.D., violet silk or cloth, lined white satin, edged white fur; LL.D., scarlet silk or cloth, lined white satin; LL.B., scarlet silk or cloth, lined white satin, edged white fur; M.D., crimson silk or cloth, lined white satin; M.B., crimson silk or cloth, lined white satin, edged white fur; Mus.D., cerulean blue silk or cloth, lined white satin; Mus.B., cerulean blue, lined white satin, edged white fur; D.Sc., "amaranth" silk or cloth, lined white satin; B.Sc., amaranth silk or cloth, lined white satin, edged white fur; M.A., black, lined red.

Victoria University.—LL.D., gold velvet or satin, lined light gold; LL.B., black, bordered violet; M.D., gold velvet or satin, lined light gold; M.B., black, bordered red; Litt.D., gold velvet or satin, lined light gold; D.Sc., gold velvet or satin, lined light gold; B.Sc., black, bordered pale red; M.A., black, lined pale blue; B.A., black, bordered pale blue.

University of Wales and Lampeter.—B.D. (Lampeter), black, lined violet, bordered white; B.A., black, bordered blue and green shot.

2. *Australia*

Sydney.—B.A., black stuff, edged white fur; M.A., black, lined blue; LL.B., black, bordered blue; LL.D., scarlet cloth, lined blue; B.Sc., black stuff, bordered amber; D.Sc., scarlet cloth, lined amber; B.E. (Engineering), black stuff, bordered light maroon; M.E., black, lined light maroon; M.B., black, bordered purple; M.C., black, lined French grey; M.D., scarlet cloth, lined purple.

Adelaide.—B.A., black, lined grey; M.A., black, lined dark grey; LL.B., black, lined blue; LL.D., dark blue, lined light blue; B.Sc., black, lined yellow; D.Sc., dark yellow, lined light yellow; M.B., black, lined rose; M.C. (Surgery), black, lined dark rose; M.D., dark rose, lined light rose; Mus.B., black, lined green; Mus.D., dark green, lined light green.

Melbourne.—B.A., black, lined dark blue; M.A., black, lined violet; Litt.D., black, lined dark blue; LL.B., black, lined white fur; LL.M., black cloth, edged red silk, lined white; LL.D., black, lined white; B.Sc., black, lined moss-green, edged white fur; M.Sc., black, lined moss-green; D.Sc., scarlet cloth, lined moss-green; B.E. (Engineering), black, lined light blue; M.E., black, lined yellow; M.B., black, lined white; M.C. (Surgery), black, lined dark amber; M.D., black, lined crimson; Mus.B., black, lined lavender, edged white fur; Mus.D., black, lined lavender.

New Zealand.—B.A., black, lined pink, edged white fur; M.A., black, lined pink; LL.B., black, lined blue, edged white fur; LL.D., black, lined light blue; B.Sc., black, lined dark blue, edged white fur; D.Sc., black, lined dark blue; M.B., black, lined mauve, edged white fur; M.D., black, lined mauve; Mus.B., black, lined white, edged white fur; Mus.D., black, lined white.

3. *Canada*

These follow the British model, with the exception of Laval, Quebec, which grants the same degrees as the University of France, the distinctive mark of which is the *scarf*.

Dalhousie (*N.S.*).—B.A., black stuff, lined white fur; M.A., black stuff, lined crimson; B.L. (Letters), black stuff, lined white, bordered light blue; M.L., black stuff, lined light blue; LL.B., black, lined white, bordered gold; LL.D., black, lined purple; B.Sc., black stuff, lined white silk, bordered crimson; M.Sc., black stuff, lined crimson; B.E. (Engineering), black stuff, lined white silk, bordered purple; M.C., scarlet cloth, bordered white; M.D., scarlet silk, bordered white; Mus.B., black stuff, lined white, bordered lavender.

Fredericton (*N.B.*).—B.A., black stuff, edged white fur; M.A., black, lined blue; B.C.L., black, lined blue silk, edged white fur; D.C.L., scarlet cloth, lined pink.

McGill (*Montreal*).—B.A., black stuff, edged white fur; M.A., black, lined blue; Litt.D. (Literature), scarlet cloth, lined pale blue; B.C.L., black, lined French grey, edged white fur; D.C.L., scarlet cloth, lined French grey; B.Sc., black, lined yellow, edged white fur; M.Sc., black, lined yellow; D.Sc., scarlet cloth, lined yellow; M.B., black, lined dark blue; M.D., scarlet cloth, lined dark blue; D.V.S. (Doctor of Veterinary Science), scarlet cloth, lined fawn.

Toronto.—D.D. (Trinity College), scarlet cloth, lined black; B.D. (Trinity College), black, unlined; B.A., black stuff, edged white fur; M.A., black, lined crimson; LL.B., blue, lined white fur; LL.D., scarlet cloth, lined pink; M.B., blue, lined white fur; M.D., scarlet cloth, lined pink.

Windsor (*N.S.*).—B.A., black stuff, edged white fur; M.A., black, lined crimson; B.C.L., blue, edged white fur; D.C.L., scarlet cloth, lined pink.

4. *India*

These follow the British model, but also give Oriental degrees, the distinctive mark of which is a sash. They also grant the degree of Licentiate in certain subjects, which has a hood.

Allahabad.—B.A., black, bordered amber; M.A., black, lined amber; LL.B., black, lined blue; LL.D., pale blue.

Bombay.—B.A., black stuff, bordered garter blue; M.A., garter blue, lined same; LL.B., black, bordered scarlet cloth; B.Sc., black stuff, bordered garter blue; L.C.E. (Engineering), black stuff, bordered brown; M.E., brown, lined garter blue; L.M. and S. (Medicine and Surgery), black stuff, bordered crimson; M.D., crimson, lined garter blue; L.Ag. (Agriculture), black stuff, bordered green.

Calcutta.—B.A., black, bordered dark blue; M.A., black, lined blue; LL.B., black, bordered green; LL.D., scarlet, lined white satin; B.Sc., black, bordered light blue; B.E., black, bordered orange; M.E., black, lined green; M.B., black, bordered scarlet; M.D., black, lined scarlet.

Madras.—B.A., black, bordered crimson; M.A., black, lined crimson; LL.B., black, lined purple; M.L., purple silk; LL.D., scarlet silk; B.E., black, lined orange; M.B., black, lined light blue; L.M. and S., black, lined light blue; M.C., black, lined light blue; M.D., scarlet cloth, lined light blue; L.San.Sc. (Sanitary Science), black, bordered terra-cotta; L.T. (Teaching), black, lined gold.

Punjab.—B.A., purple, lined yellow; M.A., purple, lined claret; Litt.D., purple, lined scarlet; LL.B., white, lined blue; LL.D., scarlet silk; M.B., purple, lined purple cloth; M.D., purple, lined purple.

5. *South Africa*

Cape of Good Hope.—B.A., black, bordered orange-brown; M.A., black, lined orange-brown, bordered black; Litt.D., orange-brown, lined white, bordered black; LL.B., black, bordered red; LL.D., red, lined white, bordered black; B.Sc., black, bordered green; M.Sc., green, bordered black; D.Sc., green, lined white, bordered black; M.B., black, bordered blue; M.D., blue, lined white, bordered black; Mus.B., black, bordered purple; Mus.M., purple, bordered black; Mus.D., purple, lined white, bordered black.

6. *United States*

The American universities have adopted a uniform system, according to which the length and shape of the hood indicate the degree (bachelor, master, doctor), the silk lining displays the official colours of the university or college granting the degree (*e.g.* crimson for Harvard, blue for Yale, orange and black for Princeton, light blue and white for Columbia, royal purple and white for Cornell and red and blue for Pennsylvania), while the velvet trimming indicates the faculty or department. Thus the trimming for arts and letters is white, for theology scarlet, laws purple, philosophy blue, science gold-yellow, fine arts brown, medicine green, music pink, pharmacy olive, dentistry lilac, forestry russet, veterinary science grey and library science lemon. It is also usual in America for a graduate of a German university to wear a hood lined with the colours of the university charged with a trichevron of the German colours, black, white and red.

UNIVERSITY COURTS, in the English universities of Oxford and Cambridge, courts of inferior jurisdiction, administering principles of justice originally founded on the canon and civil law, but now defined and limited by the common law (see particularly *Ginnett* v. *Whittingham*, 1886, 16 Q.B.D. 769).

At Oxford the judge of the chancellor's court is the vice-chancellor, who is his deputy or assessor; the court has had since 1244 civil jurisdiction, to the exclusion of the king's courts, in all matters and suits wherein a scholar or privileged person of the university is one of the parties, except in actions relating to freehold. It had also, from 1290 downwards, jurisdiction of all injuries and trespasses against the peace, mayhem and felony excepted, but since the Summary Jurisdiction Acts this is possibly no longer exercisable, but the chancellor, vice-chancellor and the vice-chancellor's deputy are justices of the peace for Oxford, Oxfordshire and Berkshire, where scholars are concerned, and exercise this jurisdiction under the Summary Jurisdiction Acts. By the Oxford University Act 1854 the vice-chancellor's court now administers the common and statute law of the realm.

The criminal jurisdiction of Cambridge University in cases where any person not a member of the university is a party has ceased, and its jurisdiction over light women, which was founded on a charter and statute of Elizabeth, was taken away in 1894 by a private act of that year (c. 60), and an act of 6 Geo. IV. c. 97, dealing with them and applicable till then only to Oxford University, was extended to Cambridge University. Previous to 1891, women of light character, who had been convicted of consorting with or soliciting members of the university *in statu pupillari*, were detained in a house of correction called the *spinning house*, but in that year a conviction was held bad (*ex parte* Hopkins, 1891, 61 L.J.Q.B. 240; see also, however, *Kemp* v. *Nevill*, 1861, 10 C.B.N.S. 523).

UNNA, a town of Germany, in the Prussian province of Westphalia, 15 m. by rail E. of Dortmund, on the line to Hamm. Pop. (1905) 16,324. It has two Roman Catholic and two Protestant churches, a synagogue and several schools. Its chief industries are iron foundries, machine shops, salt works and breweries—other articles of manufacture being bricks and cement. In the middle ages Unna formed part of the electorate of Cologne. It received municipal rights in 1256 and was a member of the Hanseatic League.

UNTERWALDEN, one of the cantons of central Switzerland, extends to the south of the lake of Lucerne, 14 sq. m. of which are included within the canton (13 being in Nidwalden). It is composed of two valleys, through which run two streams, both called Aa, and both flowing into the lake of Lucerne. The more westerly of these glens is called Obwalden, and the more easterly Nidwalden. These names really come from the 13th century expression for the inhabitants, *homines intramontani* (men dwelling in the mountains), whether of *vallis superioris* (of the upper valley) or *vallis inferioris* (of the lower valley). But in the 14th century the relative position of the two valleys is defined as "upper" and "lower" with reference to the great Kerns forest (stretching between Stans and Kerns), and hence is derived the historically inaccurate name of "Forest cantons," now so well known. The total area of the canton is 295·4 sq. m. (Obwalden has 183·2 and Nidwalden 112·1, though it must be borne in mind that the upper portion of what should be the territory of Nidwalden is, as regards the Blacken Alp, in Uri, while the Engelberg region is in Obwalden). Of this area 238·2 sq. m. (154·1 in Obwalden and 84·1 in Nidwalden) are classed as "productive," forests covering 73·8 sq. m. (47 in Obwalden and 26·8 in Nidwalden), while of the rest glaciers occupy 5·2 sq. m. (3·9 in Obwalden and 1·3 in Nidwalden), the highest point in the canton being the Titlis (10,627 ft.) situated in the Obwalden half. The small lakes of Sarnen and of Lungern are wholly situated in Obwalden. Obwalden, as including the Engelberg region, is far more mountainous than Nidwalden, which is rather hilly than mountainous. The inhabitants in both cases are mainly devoted to pastoral and, in a lesser degree, to agricultural pursuits. In Obwalden there are 290 "alps," or mountain pastures, capable of supporting 13,399 cows, and of an estimated capital value of 5,474,400 fr.: the figures for Nidwalden are respectively 166, 5207 and 3,899,900. In 1900 the total population of the canton was 28,330 (15,260 in Obwalden and 13,070 in Nidwalden), of whom all but the most insignificant proportion were German-speaking and Romanists. Till 1814 the canton was in the diocese of Constance, but since then it is practically administered by the bishop of Coire, though legally included in no diocese. The capital of Obwalden is Sarnen (*q.v.*), and of Nidwalden Stans (*q.v.*). The other most considerable villages are all in Obwalden—Kerns (2392 inhab.), Engelberg (1973 inhab.) and Lungern (1828 inhab.). The canton is traversed by the Brünig railway line from Hergiswil (in Nidwalden) to the top of the pass (20 m.), but most of the electric line from Stansstad to Engelberg (14 m.) is in Nidwalden. The mountain lines up Pilatus (Obwalden), the Stanserhorn, and to the Bürgenstock (both in Nidwalden) are also in the canton. Each half forms a single administrative district, and has its own independent local institutions, while in Obwalden there are 7 communes and in Nidwalden 11. In each the supreme legislative authority is the "*Landsgemeinde*," or primitive democratic assembly (meeting in both cases on the last Sunday in April), composed of all male citizens of 20 (Obwalden) or 18 (Nidwalden) years of age. In both cases the *Landsgemeinde* elects the executive for three years (Nidwalden) or four years (Obwalden), while it is composed of 11 (Nidwalden) or 7 (Obwalden) members, out of whom the *Landsgemeinde* elects annually the chief officials. In each half there is also a sort of "standing committee" (the *Landrath*, Nidwalden, or *Kantonsrath*, Obwalden), which drafts measures to be submitted to the *Landsgemeinde*, supervises the cantonal administration, and is empowered to spend sums below a certain amount. In each case the *Landrat* is composed of the members of the executive, plus a certain number of members elected in each "commune," in the proportion of 1 member to every 250 inhabitants, or fraction over 125 (so Nidwalden, which allows them to hold office for six years), or 1 member to every 200 inhabitants (Obwalden, which allows them to hold office for four years). These *Landsgemeinden* are of immemorial antiquity, while the other constitutional details are settled by the constitution of 1877 in Nidwalden, and by that of 1902 in Obwalden. In each half the single member of the Federal *Ständerat* is elected by the *Landsgemeinde*, while the single member enjoyed by each in the Federal *Nationalrat* is chosen by a popular vote, but not by the *Landsgemeinde*. The people of the canton have always been very pious and religious. In the church of Sachseln (near Sarnen) still lie the bones of the holy hermit, Nicholas von der Flüe, fondly known as "Bruder Klaus" (1417–1487), while at Sarnen there are several convents, though the most famous of all the monasteries in the canton, the great Benedictine house of Engelberg (founded about 1120) is situated at the head of the Nidwalden valley, though politically in Obwalden. At the lower end of the Nidwalden valley is Stans, the home of the Winkelried family (*q.v.*).

It is very remarkable that in both valleys the old "common lands" are still in the hands of the old gilds, and "communes" consist of natives, not merely residents, though in Obwalden these contribute to the expenses of the new "political communes" of residents, while in Nidwalden the latter have to raise special taxes. In Engelberg (which still retains some independence) the poor are greatly favoured in the division of the common lands and their proceeds, and unmarried persons (or widowers and widows) receive only half of the share of those who are married.

Historically, both Obwalden (save a small bit in the Aargau) and Nidwalden were included in the Zürichgau. In both there were many great landowners (specially the abbey of Murbach and the Habsburgs) and few free men; while the fact that the Habsburgs were counts of the Aargau and the Zürichgau further delayed the development of political freedom. Both took part in the risings of 1245–47, and in 1247 Sarnen was threatened by the pope with excommunication for opposing its hereditary lord, the count of Habsburg. The alleged cruelties committed by the Habsburgs do not, however, appear in history till Justinger's *Chronicle*, 1420 (see TELL). On the 16th of April 1291, Rudolph the future emperor bought from Murbach all its estates in Unterwalden, and thus ruled this district as the chief landowner, as count and as emperor. On the 1st of August 1291 Nidwalden (Obwalden is not named in the text of the document, though it is named on the seal appended to it) formed the "Everlasting League" with Uri and Schwyz (this being the first known case in which its common seal is used). In 1304 the two valleys were joined together under the same local deputy of the count, and in 1309 Henry VII. confirmed to them all the liberties granted by his predecessor —though none is known to have been granted. However, this placed Unterwalden on an equal political footing with Uri and Schwyz; and as such it took part (1315) in Morgarten fight (also driving back an invasion over the Brünig Pass) and in the renewal of the Everlasting League at Brunnen (1315), as well as at Sempach (1386) and in driving back the Gugler or English freebooters (1375). For physical reasons, it was difficult for Unterwalden to enlarge its territories. Yet in 1368 it acquired Alpnach, and in 1378 Hergiswil. So too Obwalden shared with Uri in the conquest of the Val Leventina (1403) and in the purchase of Bellinzona (1419), as well as in the loss of both (1422). It was Nidwalden that, with Schwyz and Uri, finally won (1500) and ruled (till 1798) Bellinzona, the Riviera, and the Val Blernio; while both shared in conquests of the Aargau (1415), the Thurgau (1460), and Locarno, &c. (1512), and in the temporary occupation of the Val d' Ossola (1410–14, 1416–22, 1425–26, 1512–15). In the Burgundian war Unterwalden, like the other Forest cantons, long hung back through jealousy of Bern, but came to the rescue in time of need. In 1481 it was at Stans that the Confederates nearly broke up the League for various reasons, and it was only by the intervention then of the holy hermit Nicholas von der Flüe (of Sachseln in Obwalden) that peace was restored, and the great Federal agreement known as the compact of Stans concluded. Like the other Forest cantons, Unterwalden clung to the old faith at the time of the Reformation, being a member of the "Christliche Vereinigung" (1529) and of the Golden League (1586).

In 1798 Unterwalden resisted the Helvetic republic, but, having formed part of the short-lived Tellgau, became a district of the huge canton of the Waldstätten. Obwalden submitted at an early date, but Nidwalden, refusing to accept the oath of fidelity to the constitution mainly on religious grounds, rose in desperate revolt (September 1798), and was only put down by the arrival of 16,000 armed men and by the storming of Stans. In 1803 its independence as a canton was restored, but in 1815 Nidwalden refused to accept the new constitution, and Federal troops had to be employed to put down its resistance, the punishment inflicted being the transfer (1816) to Obwalden of the jurisdiction over the abbey lands of Engelberg (since 1462 "protected" by the four Forest cantons), which in 1798 had fallen to the lot of Obwalden and had passed in 1803 to Nidwalden. Since that time the history of Unterwalden has been like that of the other Forest cantons. It was a member of the "League of Sarnen" (1832), to oppose the reforming wishes of other cantons, and of the "Sonderbund" (1845); it was defeated in the war of 1847; and it voted against the acceptance of the Federal constitution both in 1848 and in 1874.

UNTON (or UMPTON), **SIR HENRY** (*c.* 1557–1596), English diplomatist, was the second son of Sir Edward Unton, or Umpton (d. 1583), of Wadley, near Faringdon, Berkshire, his mother, Anne (d. 1588), being a daughter of Edward Seymour, duke of Somerset, the protector. Educated at Oriel College, Oxford, Unton became a member of parliament in 1584 and served with the English forces in the Netherlands in 1585 and 1586, being present at the skirmish of Zutphen. In 1586 he was knighted. In 1591, through the good offices of the earl of Essex, Unton was sent as ambassador to Henry IV. of France; he became very friendly with this king and accompanied him on a campaign in Normandy before he was recalled to England in June 1592. Again securing a seat in parliament he lost for a short time the favour of Queen Elizabeth; however, in 1593 he went again as ambassador to France. He died in the French camp at La Fère on the 23rd of March 1596, a collection of Latin verses being published in his memory at Oxford later in the year. This was edited by his chaplain, Robert Wright (1560–1643), afterwards bishop of Lichfield and Coventry.

There is an interesting picture in the National Portrait Gallery representing Unton and various scenes in his life. Many of his official letters are in the British Museum and in the Public Record Office, London. A collection of these was edited by Joseph Stevenson (1847), and some are printed in W. Murdiu's *Burghley Papers* (1759).

UNYAMWEZI, a region of German East Africa, lying S. of Victoria Nyanza and E. of Lake Tanganyika. It is mentioned as early as the 16th century by the Portuguese and by Antonio Pigafetta, under the name Munemugi or "Land of the Moon," which is the exact equivalent of the name—Wu-nya-mwezi—by which the land is known to its own people. It is part of the plateau between the two great rift-valleys of East Africa, is rich in woods and grass, and has many villages surrounded by well cultivated farms and gardens. The western portions, however, are somewhat swampy and unhealthy. The people of Unyamwezi, called Wanyamwezi, are Bantu-negroes of medium size and negroid features, but with long noses and curly rather than woolly hair, suggestive of mixed blood. Dwelling on the main road from Bagamoyo to Tanganyika, the route by which J. H. Speke, Richard Burton, J. A. Grant, H. M. Stanley and others travelled, and having from early times had commercial relations with the Arabs, the Wanyamwezi are more civilized than the neighbouring races. They practise tattooing, file or extract the upper incisor teeth, and load their legs and arms with brass wire rings. The men look after the flocks and poultry, while the women do the field-work. They often keep bees; in some cases the hives are inside the huts, and the bees form an efficient protection against intruders. Inheritance is to the direct issue, not as is often the case among Negro races to the nephew. In some parts, one of twins is always killed. On Stanley's first visit in 1871, the Zanzibar Arabs were predominant in the country, but later the natives rose and, under Mirambo, who from a common porter rose to be a conquering chief—earning for himself the title of the "Black Bonaparte"—a Negro kingdom was formed. Since 1890 the country has been under German control and the power of the native chiefs greatly curtailed. As a people the Wanyamwezi are extremely vigorous and have shown great capacity for expansion, being energetic and enterprising.

See H. Brode, *Tippoo Tib: the Story of his Career in Central Africa* (1907); Sir H. H. Johnston, *The Uganda Protectorate* (1902); Sir Charles Eliot, *The East Africa Protectorate* (1905).

UNYORO, called by its people Bunyoro, a country of east central Africa lying N.W. of the kingdom of Buganda (Uganda) and bounded E. and N. by the Victoria Nile. On the west, Unyoro includes nearly all the eastern shores of Albert Nyanza and a strip of territory—incorporated in Belgian Congo in 1910—west of that lake. In 1896 a British protectorate was established over Unyoro, which now forms the S.W. part of the northern province of the Uganda Protectorate. The limits of Unyoro have varied according to the strength of its rulers; during the 19th century the states of Bunyoro and Buganda appear to have been rivals for the overlordship of the region between the Bahr-el-Jebel and the great lakes. The Banyoro (as its people call themselves) had a certain degree of civilization and were skilled in iron-work, pottery and wood-work. The ruling class is of Hima stock, the Bahima possessing large herds of cattle. The first Europeans to enter the country were J. H. Speke and J. A. Grant, who spent part of 1862 there, the king, Kamurasi, putting many obstacles in the way of the travellers continuing their journey down the Nile. Its next white visitors were Sir Samuel and Lady Baker, who in 1864 discovered the Albert Nyanza. At this time ivory and slave traders, nominally Egyptian subjects, penetrated as far south as Unyoro, and a few years later (1870–74) Baker, as governor-general of the Equatorial Provinces, extended Egyptian influence over the country and placed a garrison at Foweira on the Victoria Nile. He formally annexed Unyoro to the Egyptian dominions at Masindi on the 14th of May 1872. General Gordon, who succeeded Baker, established posts at Masindi and Mruli. With King Kabarega, a son of Kamurasi, the Egyptians had many encounters. Egyptian authority ceased altogether with the withdrawal of Emin Pasha in 1888, but not long afterwards British influence began to be felt in the country. Kabarega in 1891 found himself in conflict with Captain F. D. Lugard, who entered Unyoro from the south. From this point the history of Unyoro is traced in the article UGANDA. It need only be stated here that in 1899 Kabarega was captured by the British and deported to the Seychelles, and that one of his sons (Yosia, a minor) was subsequently recognized as chief in his place, though with very restricted powers, the province being virtually administered directly by the British government.

Unyoro has played rather an important rôle in the past (unwritten) history of Equatorial Africa as being the region from which the ancient Gala (Hamitic) aristocracy, coming from Nileland, penetrated the forests of Bantu Africa, bringing with them the Neolithic civilization, the use of metals, and the keeping of cattle. Unyoro, though not a large country, is in many ways remarkable. It is thought to contain gold in the north and north-east. In the west and south-west are the vast primeval forests of Budonga and Bugoma, containing large chimpanzees and a peculiar sub-species of straight-tusked elephants (only found in Unyoro).

See the works of Speke, Grant and Baker; also *Colonel Gordon in Central Africa* (4th ed., 1885); J. F. Cunningham's *Uganda and its Peoples* (1905); and Winston Churchill's *My African Journey* (1908). (H. H. J.)

UPAS, a Javanese word meaning poison, and specially applied to the poison derived from the gum of the anchar tree (*Antiaris toxicaria*), a member of the fig-family (Moraceae), and a native of the Sunda Islands, which was commonly used to envenom the darts of the natives. The name of the upas tree has become famous from the mendacious account (professedly by one Foersch, who was a surgeon at Samarang in 1773) published in the *London Magazine*, December 1783, and popularized by Erasmus Darwin in "Loves of the Plants" (*Botanic Garden*, pt. ii.). The tree was said to destroy all animal life within a radius of 15 m. or more. The poison was fetched by condemned malefactors, of whom scarcely two out of twenty returned. All this is pure fable, and in good part not even traditional fable, but mere invention. The milky juice of the tree contains an active principle named *antiarin*, which has been recommended as a cardiac stimulant. It is without any properties, however, that entitle it to clinical employment. The tree is described as one of the largest in the forests of Java, the straight cylindrical stem rising without a branch to the height of 60 to 80 ft. It has a whitish bark and on being wounded yields plentifully the milky juice from which the poison is prepared.

For a full account of the tree, see Bennett and Brown, *Plantae Javanicae rariores*, p. 52 (1838).

UPHOLSTERER, in modern usage, a tradesman who supplies coverings, cushions, padding and stuffing for chairs, sofas or beds, or who repairs the same, and more generally one who also provides carpets, curtains and household furniture. The word first appears as "upholder," then as "upholdster" or "upholster," and finally with repetition of -er, as in "poulterer," "upholsterer." The first meaning seems to have been a broker or dealer in small wares. Probably the name was given to a broker who sold such goods by auction, holding them up to public view as is the manner of auction-rooms.

UPPER SIND FRONTIER, a district of British India, in the Sind province of Bombay, with administrative headquarters at Jacobabad. Area, 2621 sq. m. In the north-east the country is hilly; the remainder consists of a narrow strip of level plain, one half being covered with jungle and subject to inundation, from which it is protected by artificial embankments. The land is watered by canals from the Indus, of which the chief are the Begari and Desert canals. The district contains several thriving timber plantations. The climate is remarkable for its dryness and for its extraordinary variations of temperature. The annual rainfall at Jacobabad averages less than 5 in. In 1901 the population was 232,045, showing an increase of no less than 33% in the decade, chiefly due to immigration from Baluchistan. The principal crops are millets, oil-seeds, pulses, wheat and rice. The internal trade is principally in grain, the greater part of which is sent to the sea-board; the transit trade from Central Asia into Sind crosses the district, bringing wool and woollen goods, fruits, carpets and horses. The district is crossed by the Quetta branch of the North-Western railway. The wild Baluchi inhabitants were pacified by General John Jacob between 1847 and his death in 1858.

UPPINGHAM, a market town of Rutland, England, 98 m. N.N.E. of London, on a branch of the London & North-Western railway. Pop. (1901) 2588. The church of St Peter and St Paul has Decorated portions in the nave, tower and spire. The pulpit is of the 17th century. Jeremy Taylor was rector here at the outbreak of the Civil War. The principal institution of Uppingham is the school. It is coeval with the grammar school of Oakham (1584), and had the same founder, Robert Johnson, archdeacon of Leicester. It rose in the last half of the 19th century to a place of distinction among English public schools, owing to the exertions of its headmaster (1853–77), the Rev. Edward Thring. A new group of school-buildings, with chapel, was erected in 1863 from the designs of G. E. Street. New (Tercentenary) class-rooms were opened in 1890, and a memorial chapel, containing a statue of Edward Thring, by T. Brock, R.A., was erected in 1891. The Victoria Building, containing museum, laboratory and lecture theatre, was opened in 1897. The quadrangle is by T. G. Jackson, R.A., and over the gateway is a statue of the founder, by G. J. Frampton, R.A. The school contains about 450 boys. There are general exhibitions to the universities, and also several, in which scholars of this school and Oakham school have preference, at St John's, Clare, Emmanuel and Sidney Sussex colleges, Cambridge. The town of Uppingham has some agricultural trade.

UPSALA, or UPPSALA, a city of Sweden, the seat of a university and of the archbishop of Sweden, chief town of the district (*län*) of Upsala, 41 m. N. of Stockholm by the Northern railway. Pop. (1900) 22,855. It has water-communication with Stockholm by the river Fyris and the northward arm of Lake Mälar, into which it flows. The older part of the city lies on its sloping west bank, the cathedral and castle occupying dominating heights, with the university buildings below. West and south is a girdle of gardens. The new town occupies the flat east bank, and the whole is set in a fertile plain.

The university, the chief and oldest in Sweden, was founded in 1477 by Archbishop Jakob Ulfsson. The university building, completed in 1887, lies west of the cathedral. It has a fine vestibule with galleries, lit from a cupola, a senate-hall, rooms for the governing body, and lecture rooms. The whole is very richly adorned. The library building was erected in 1819–41. It is on the site of the Academia Carolina, founded by Charles IX., and is known in consequence as *Carolina Rediviva.* Since 1707 the library has had the right of receiving a copy of every work printed in Sweden, and its MS. collection is also large and valuable. Among the MSS. is the famous *Codex Argenteus* (6th century), a translation of the Gospels in the Gothic of Bishop Ulfilas (4th century). Other university institutions are the chemical laboratory, the chemical, physical and pathological institutes, the anatomy house, and the collection of Northern antiquities. The last is situated in the old botanic garden, where Rudbeck and Linnaeus worked, and Linnaeus had his residence. The new botanic garden, W. of the castle hill, was given by Gustavus III. in 1787. The astronomical observatory was founded in 1730, though there was a professorial chair in the preceding century. The Victoria Museum contains Egyptian antiquities. The Royal Society of Sciences, founded in 1710 by Archbishop Erik Benzelius, occupies a house of its own and has a valuable library. Among other learned societies in the university are the Royal Association for Literary Science, and the Society for Swedish Literature. The annual expenditure of the university amounts to about £56,000, a large proportion of which is covered by a grant from parliament. The revenue of the university itself, however, amounts to about £25,000, a considerable part of which is still drawn from the property with which Gustavus Adolphus endowed it in 1624 from his private estates, amounting to 360 farms. There are about sixty professors, and a large number of assistants, lecturers and docents. The number of students is from 1500 to 2000, but it fluctuates considerably; the average in 1886–90 was 1825. Every student must belong to a "nation" (*landskap*), of which there are thirteen, each comprising mainly students from a particular part of the country. Each nation has generally its own club-house and fund. There are also societies for special branches of study, athletics and music, especially singing, for which the students have a deservedly high reputation. A cap of white velvet with a black border is worn by the students.

The cathedral stands nobly above the town; its tall western towers with their modern copper-sheathed spires are visible for many miles. It is of simple form, consisting of a nave with aisles and flanking chapels, short transepts, and choir with ambulatory and chapels and an apsidal eastern end. It is French in style (the first architect was a Frenchman, Étienne de Bonneuil) modified by the use of brick as building material. Ornamentation is thus slight except at the southern portal. The church was building from 1287 to 1435. It suffered from several fires, and a thorough restoration was completed in 1893. The easternmost chapel is the fine mausoleum of Gustavus Vasa. The castle was founded in 1548 by Gustavus I. but was not finished till a century later, when it was often used as a royal residence. It was destroyed by fire in 1702, and is still in part ruined, but part is used as the offices of the government of the *län* and the residence of the governor. Apart from the cathedral and a few insignificant buildings, there are no other medieval remains. Among institutions may be mentioned the Ultuna Agricultural Institute, immediately south of the city. The industries are unimportant.

The name of Upsala originally belonged to a place still called Old Upsala nearly 2 m. N. of the present city. This Upsala, mentioned as early as the 9th century, was famous throughout Scandinavia for its splendid heathen temple, which, gleaming with gold, made it the centre of the country, then divided into a great number of small kingdoms. Three huge grave mounds or barrows remain here. In the same place the first cathedral of the bishops of Upsala was also erected (*c.* 1100). On the destruction of this building by fire, the inconvenient situation caused the removal in 1273 of the archiepiscopal see to the present city, then called Ostra Aros,[1] but within a short time it came to be generally called Upsala. During the middle ages the cathedral and the see of the archbishop made Upsala a kind of ecclesiastical capital. Here the kings were crowned, after their election had taken place at the Mora Stones, 10 m. S.E. of Upsala. In 1567 Eric XIV. murdered in the castle five of the most eminent men of the kingdom, three of them belonging to the family of Sture. In 1593 was held the great synod which marks the final victory of Protestantism in Sweden; in the same year the university was restored by Charles IX. In the castle, Christina, daughter of Gustavus Adolphus, resigned her crown to Charles X. in 1654. In 1702 nearly the whole city, with the castle and the cathedral, was burnt down. Among the teachers of the university who have carried its name beyond the boundaries of their own country the following (besides Linnaeus) deserve to be mentioned: Olof Rudbeck the elder, the author of the *Atlantica* (1630–1702); Torbern Bergman (1735–1784), the celebrated chemist; and Erik Gustaf Geijer (1783–1847), the historian.

UR, one of the most important of the early Babylonian cities, represented to-day by the ruin mounds called Mughair (Moghair), or, more properly, Muqayyar (Muḳayyar), "the pitched," or "pitch-built." It lay 140 m. S.E. of Babylon (30° 95′ N., 46° 5′ E.), about 6 m. S. of the present bed of the Euphrates, half-way between that and the low, pebbly sandstone hills which form the border of the Syrian desert, and almost opposite the mouth of the Shatt-el-Haï, on the Sa'ade canal. It was the site of a famous temple, E-Nannar, "house of Nannar," and the chief seat in Babylonia of the worship of the moon-god, Nannar, later known as Sin (*q.v.*). Under the title Ur of the Chaldees, it is mentioned in the Bible as the original home of Abraham. It is worthy of notice that Haran, in upper Mesopotamia, which also was a home of Abraham, was likewise a famous site of worship of the god Sin, and that the name of that god also appears in Mount Sinai, which was historically connected with the origin of the Hebrew nation and religion. While not equal, apparently, in antiquity, and

[1] The name first occurs in Snorro Sturluson in connection with events of the year 1018; it signifies "the mouth of the eastern river."

certainly not in religious importance, to the cities of Nippur, Eridu and Erech, Ur, from a very early period, played a most important part politically and commercially. Lying at the junction of the Euphrates and Tigris, at the head of the Persian Gulf, it enjoyed very extensive water-communications with rich and important regions. Lying close to the Syrian desert, at a natural point of communication with Arabia, it was the centre of caravan communication with interior, southern and western Arabia. In the Sumerian period, antedating the time of Sargon, about or before 3000 B.C., we find Ur exercising hegemony in Babylonia under a king whose name is read Lugal-Kigub-Nidudu. Comparatively early, however, it became a centre of Semitic influence and power, and immediately after the time of the Sargonids it comes to the front, under King Ur-Gur, or Ur-Engur, the great builder of *ziggurats* (stage-towers) in the ancient Babylonian cities, as mistress of both northern and southern Babylonia, and even seems to have exacted tribute from countries as far remote as southern Syria. With relatively brief intervals, during which Erech and Isin come to the fore, Ur held the hegemony in Babylonia until or shortly before the Elamite invasion, when Larsa became the seat of authority. After the period of the Elamite dominion and the establishment of the empire of Babylon, under Khammurabi, about or shortly after 2000 B.C., Ur lost its political independence and, to a considerable extent, its political importance. The gradual filling up of the Persian Gulf had probably also begun to interfere with its trade supremacy. It continued, however, to be a place of religious and literary importance until the close of the Babylonian period. The ruins of the ancient site were partly excavated by Loftus and Taylor in 1854. They are egg-shaped, with the sharper end towards the north-west, somewhat elevated above the surrounding country, which is liable to be inundated by the Euphrates, and encircled by a wall 2946 yards in circumference, with a length of 1056 and a greatest breadth of 825 yds. The principal ruin is the temple of E—Nannar, in the north-western part of the mounds. This was surrounded by a low outer wall, within which rose a platform, about 20 ft. in height, on which stood a two-storeyed *ziggurat*, or stage-tower, a right-angled parallelogram in shape, the long sides towards the north-east and south-west. The lower stage measured 198 ft. in length by 133 ft. in breadth, and is still standing to the height of 27 ft. The second storey was 14 ft. in height and measured 119 by 75 ft. The ascent to the first storey was by a stairway 8 ft. broad, on the north-east side. Access to the summit of the second storey was had on the same side, either by an inclined plane or a broad stairway—it is not clear which—extending, apparently, the whole length of that stage. Ruins on the summit show that there was a chamber on top, apparently of a very ornamental character, like that at Eridu. The bricks of the lower stage are laid in bitumen, and bear the inscription of Ur-Gur. The bricks of the upper stage are laid in mortar, and clay cylinders found in the four corners of this stage bore an inscription of Nabonidus, the last king of Babylon (639 B.C.), closing with a prayer for his son Belshar-uzur (Bel-sarra-Uzur), the Belshazzar of the book of Daniel. Between these two extremes were found evidences of restoration by Ishme-Dagan of Isin and Gimil-Sin of Ur, somewhere towards the middle of the 3rd millennium B.C., and of Kuri-galzu, a Cossaean (Kassite) king of Babylon, of the 14th century B.C. Nebuchadrezzar also claims to have rebuilt this temple. Taylor further excavated an interesting Babylonian building, not far from the temple, and part of an ancient Babylonian necropolis. All about the city he found abundant remains of burials of later periods. Apparently, in the later times, owing to its sanctity, Ur became a favourite place of sepulture, so that after it had ceased to be inhabited it still continued to be used as a necropolis. The great quantity of pitch used in the construction of these ruins, which has given them the name by which they are to-day known among the Arabs, is evidence of a peculiarly close relation with some pitch-producing neighbourhood, presumably Hit, which lay at the head of the Sa'ade canal on which Ur was located. Large piles of slab and scoria, in the neighbourhood of Ur, show, apparently, that the pitch was also used for manufacturing purposes, and that Ur was a manufacturing as well as a commercial city. Since Taylor's time Mughair has been visited by numerous travellers, almost all of whom have found ancient Babylonian remains, inscribed stones and the like, lying upon the surface. The site is rich in remains, and is relatively easy to explore.

URAL-ALTAIC, the general term for a group of languages (also called Turanian, Finno-Tatar, &c.) constituting a primary linguistic family of the eastern hemisphere. Its subgroups are Turkish, Finno-Ugrian, Mongol and Manchu. Philologists have differentiated various forms of the languages into numerous subdivisions; and considerable obscurity rests on the relationship which such languages as Japanese or ancient Accadian and Etruscan bear to the subgroups already named, which are dealt with in other articles.

In its morphology Ural-Altaic belongs to the agglutinating order of speech, differing from other languages of this order chiefly in the exclusive use of suffixes attached to the unmodified root, and partly blended with it by the principle of progressive vowel harmony, in virtue of which the vowels of all the suffixes are assimilated to that of the root. Thus the typical formula is R+R+R+R, &c., where R is the root, always placed first, and R, R, R . . . the successive postfixed relational elements, whose vowels conform by certain subtle laws of euphony to that of the root, which never changes. These suffixes differ also from the case and verbal endings of true inflecting languages (Aryan, Semitic) in their slighter fusion with the root, with which they are rather mechanically united (agglutinated) than chemically fused into a term in which root and relational element are no longer separable. Hence it is that the roots, which in Aryan are generally obscured, blurred, often even changed past the possibility of identification, in Ural-Altaic are always in evidence, unaffected by the addition of any number of formative particles, and controlling the whole formation of the word. For instance, the infinitive element *mak* of the Osmanli *yaz-mak*=to write becomes *mek* in *sev-mek*=to love (vowel harmony), and shifts its place in *sev-il-mek*=to be loved (imperfect fusion with the root), while the root itself remains unchanged as to form and position in *sev-ish-il-mek*=to be impelled to love, or in any other possible combination with suffixed elements. The facility with which particles are in this way tacked on produces an exuberance, especially of verbal forms, which in Osmanli, Finnish, Magyar, Tungus and Mordvinian may be said to run riot. This is particularly the case when the numerous modal forms become further complicated by incorporating the direct pronominal object, as in the Magyar *varjak*=they await him, and the Mordvinian *palasa*=I embrace him. Thus arise endless verbal combinations, reckoned in Turki at nearly 30,000, and past counting in the Ugrian group.

Another marked peculiarity of the Ural-Altaic, at least as compared with the inflecting orders of speech, is weak subjectivity, the subject or agent being slightly, the object of the action strongly accentuated, so that "it was done by him" becomes "it was done with him, through him, or in his place" (*apud eum*). From this feature, which seems to be characteristic of all the branches, there follow some important consequences, such as a great preponderance of locative forms in the declension, —the nominative, and often even the possessive, being expressed by no special suffix. Hence also the object normally precedes the subject, while the idea of possession (to have) is almost everywhere replaced by that of being (to be), so that, even in the highly developed Osmanli, "I have no money" becomes "money-to-me not-is" (*Akchehīm yokdür*). In fact the verb is not clearly differentiated from the noun, so that the conjugation is mainly participial, being effected by agglutinating pronominal, modal, temporal, negative, passive, causative, reciprocal, reflexive and other suffixes to nominal roots or gerunds: I write = writing-to-me-is. Owing to this confusion of noun and verb, the same suffixes are readily attached indifferently to both, as in the Osmanli *jân* = soul, *jân-ler* = souls, and *yâzâr* = he will write, *yâzâr-ler* = they will write. So also, by assimilation, the Yakut *kötördör kölöllör* = the birds fly (from root *köl* = flying), where *kötöl* stands for *kölör*, and *dör* for *lör*, the Osmanli *ler*, or suffix of plurality.

But, notwithstanding this wealth of nominal or verbal forms, there is a great dearth of general relational elements, such as the relative pronoun, grammatical gender, degrees of comparison, conjunctions and even postpositions. Byrne's remark, made in reference to Tungus, that "there is a great scarcity of elements of relation, very few conjunctions, and no true postpositions, except those which are given in the declension of the noun,"[1] is mainly true of the whole family, in which nouns constantly do duty for formative suffixes. Thus nearly all the Ostiak postpositions are nouns which take the possessive suffix and govern other nouns in the genitive, precisely as in the Hindi: *ādmī-kī-ṭărăf* (*men*) *găyā* = man-of-direction (in) I went = I went towards the man, where the so-called postposition *ṭărăf*, being a feminine noun = direction, requires the preceding possessive particle to be also feminine (*kī* for *kē*).

As there are thus only two classes of words—the roots, which always remain roots, and the suffixes, which always remain suffixes—it follows that there can be no true composition or word-building, but only derivation. Even the numerous Magyar nominal and adjectival compounds are not true compounds, but merely two words in juxtaposition, unconnected by vowel harmony and liable to be separated in construction by intervening particles. Thus in *aran-sinü* = gold-colour = golden, the first part *aran* receives the particle of comparison, the second remaining unchanged, as if we were to say "gold-er-colour" for "more golden"; and *ala-fi* = relative becomes *ala-m-fi-a* = my relative, with intrusion of the pronominal *m* = my.

But, while these salient features are common, or nearly common, to all, it is not to be supposed that the various groups otherwise present any very close uniformity of structure or vocabulary. Excluding the doubtful members, the relationship between the several branches is far less intimate than between the various divisions of the Semitic and even of the Aryan family, so that, great as is, for instance, the gap between English and Sanskrit, that between Lapp and Manchu is still greater.

After the labours of Castrén, Csink, Gabelentz, Schmidt, Böhtlingk, Zenker, Almqvist, Radlov, Munkacsi-Berat and especially Winkler, their genetic affinity can no longer be seriously doubted. But the order of their genetic descent from a presumed common organic Ural-Altaic language is a question presenting even greater difficulties than the analogous Aryan problem. The reason is, not only because these groups are spread over a far wider range, but because the dispersion from a common centre took place at a time when the organic speech was still in a very low state of development. Hence the various groups, starting with little more than a common first germ, sufficient, however, to give a uniform direction to their subsequent evolution, have largely diverged from each other during their independent development since the remotest prehistoric times. Hence also, while the Aryan as now known to us represents a descending line of evolution from the synthetic to the analytic state, the Ural-Altaic represents on the contrary an upward growth, ranging from the crudest syntactical arrangements in Manchu to a highly agglutinating but not true inflecting state in Finnish.[2] No doubt Manchu also, like its congeners, had formerly possessive affixes and personal elements, lost probably through Chinese influences; but it can never have possessed the surprisingly rich and even superabundant relational forms so characteristic of Magyar, Finn, Osmanli and other western branches. As regards the mutual relations of all the groups, little more can now be said than that they fall naturally into two main divisions—Mongolo-Turkic and Finno-Ugro-Samoyedo-Tungusic—according to the several methods of employing the auxiliary elements. Certainly Turkic lies much closer to Mongolic than it does to Samoyedic and Tungusic, while Finno-Ugric seems to occupy an intermediate position between Turkic and Samoyedic, agreeing chiefly in its roots with the former, in its suffixes with the latter. Finno-Ugric must have separated much earlier, Mongolic much later, from the common connexion, and the latter, which has still more than half its roots and numerous forms in common with Turkic, appears on the whole to be the most typical member of the family. Hence many Turkic forms and words can be explained only by reference to Mongolic, which has at the same time numerous relations to Finno-Ugric and Samoyedic that have been lost in Turkic and Tungusic. It may therefore be concluded that the Finno-Ugric migrations to the north and west and the Tungusic to the east had been completed while the Turkic and Mongolic tribes were still dwelling side by side on the Altai steppes, the probable cradle of the Ural-Altaic peoples.

How profoundly the several groups differ one from the other even in their structure is evident from the fact that such assumed universal features as unchangeable roots and vowel harmony are subject to numerous exceptions, often spread over wide areas. Not only is assimilation of final consonants very common, as in the Osmanli *bulun-mak* for the Uighur *bulul-mak*, but the root vowel itself is frequently subject to *umlaut* through the influence of suffixed vowels, as in the Aryan family. Thus in the Surgut dialect of Ostiak the long vowels of nominal stems become modified before the possessive suffix, *ā* and *ē* to *ī* and *ō* to *ū* (Castrén). It is still more remarkable to find that the eastern (Yenisei) Ostiak has even developed verbal forms analogous to the Teutonic strong conjugation, the presents *tabāq‘*, *abbatag‘an* and *datpaq‘* becoming in the past *tobāq‘*, *abbatog‘an* and *datpiyaq‘* respectively; so also *taig, törg and tārg*, present, past and imperative, are highly suggestive of Teutonic inflexion, but more probably are due to Tibetan influences. In the same dialects many nouns form their plurals either by modifying the root vowel, in combination with a suffixed element, or by modification alone, the suffix having disappeared, as in the English *foot—feet, goose—geese*. So also vowel harmony, highly developed in Finnish, Magyar and Osmanli, and of which two distinct forms occur in Yakutic, scarcely exists at all in Cheremissian, Votyak and the Revel dialect of Esthonian, while in Mordvinian and Syryenian, not the whole word, but the final vowels alone are harmonized. The unassimilated Uighuric *kilur-im* answers to the Osmanli *kilur-um*, while in Manchu the concordance is neglected, especially when two consonants intervene between the root and the suffixed vowels. But too much weight should not be attached to the phenomenon of vowel harmony, which is of comparatively recent origin, as shown in the oldest Magyar texts of the 12th century, which abound in such discordances as *halâl-nek*, *tiszta-seg*, for the modern *halâl-nak*, *tiszta-sag*. It clearly did not exist in the organic Ural-Altaic speech, but was independently developed by the different branches on different lines after the dispersion, its origin being due to the natural tendency to merge root and suffix in one harmonious whole.

This progressive vocalic harmony has been compared to a sort of progressive *umlaut*, in which the suffixed vowels are brought by assimilation into harmony with those of the root. All vowels are broadly divided into two categories, the guttural or hard and the palatal or weak, the principle requiring that, if the root vowel be hard, the suffixed must also be hard, and vice versa. But in some of the groups there is an intermediate class of "neutral" vowels, which do not require to be harmonized, being indifferent to either category. In accordance with these general principles the vowels in some of the leading members of the Altaic family are thus classified by L. Adam:[3]—

	Gutturals.	Palatals.	Neutrals.
Finnish	u, o, a	ü, ö, ä	e, i
Magyar	u, o, a	ü, ö	e, i
Mordvinian . . .	u, o, a	ä, i	. .
Syryenian	ô, a	ä, i, e	. .
Osmanli	u, o, a, e	ü, ö, e, i	. .
Mongolian	u, o, a	ü, ö, ä	i
Buriat	u, o, a	ü, ö, ä	e, i
Manchu	ô, o, a	e	u, i

A close analogy to this law is presented by the Irish rule of "broad to broad" and "slender to slender," according to which under certain conditions a broad (*a*, *o*, *u*) must be followed in the next syllable by a broad, and a slender (*e*, *i*) by a slender. Obvious parallelisms are also such forms in Latin as *annus*, *perennis*, *ars*, *iners*, *lego*, *diligo*, where, however, the root vowel is modified by the affix, not the affix by the root. But such instances suffice to show

[1] *Gen. Prin. of Struct. of Lang.* i. 391 (London, 1885).

[2] "Meine Ansichten werden sich im Fortgange ergeben, so namentlich dass ich nicht entfernt die finnischen Sprachen für flexivische halten kann" (H. Winkler, *Uralaltaische Völker*, 1884, i. p. 54). Yet even true inflexion can scarcely be denied at least to some of the so-called Yenisei Ostiak dialects, such as Kotta and others still surviving about the middle Yenisei and on its affluents, the Agul and Kan (Castrén, *Yen.*, *Ostjak und Kort. Sprachlehre*, 1858, Preface, pp. v-viii). These, however, may be regarded as aberrant members of the family, and on the whole it is true that the Ural-Altaic system nowhere quite reaches the stage of true inflexion.

[3] *De l'harmonie des voyelles dans les langues Ouralo-Altaïques* (Paris, 1874).

that the harmonic principle is not peculiar to the Ural-Altaic, but only more systematically developed in that than in most other linguistic families.

URAL MOUNTAINS, a system of mountains which extends from the Arctic Ocean southwards nearly to the Caspian Sea, and is regarded as separating Europe from Asia. Russians describe them either as Kameñ (stone) merely, or by the appropriate name of Poyas (girdle), while the name of Urals (*Uraly*)—derived either from the Ostyak *urr* (chain of mountains) or from the Turkish *aral-tau* or *ural-tau*—has with them become a generic name for extensive mountain chains. Although the real structure of the Urals, both orographical and geological, is imperfectly ascertained, enough is known to warrant the statement that they have been affected by a series of separate upheavals, some having a north-western strike and some a north-eastern, and that they reach their maximum altitudes along a zone stretching nearly north and south. The composite nature of the Urals is best seen at the northern and southern extremities of the system, where the upheavals assume the character of distinct chains of mountains.

The Paë-khoy or coast ridge (Samoyedic "stony ridge") is quite independent of the Urals proper, from which it is separated by a marshy *tundra*, some 30 m. wide. It has a distinct north-north-westerly and north-westerly trend along the shores of the Kara Sea; and, although it is cut through by the Ugrian Strait (Yugorskiy-shar), there is no doubt that it is continued in Vaygach Island and Novaya-Zemlya. Its dome-shaped summits, which rise 1000 ft. above the *tundra* (Vozaipaë, 1312 ft.), are completely destitute of trees, and its stony crags are separated by broad marshy *tundras*.

The Obdorsk or Northern Urals, which begin within a few miles of the head of Kara Bay (Konstantinov Kameñ, in 68° 30′ N., 1465 ft.), and extend south-west as far as the 64th parallel, form a distinct range, stony and craggy, sloping steeply towards the south-east and gently towards the marshes of European Russia. Its highest elevations (*e.g.* Khard-yues, 3715 ft., and Paë-yer, 4650 ft.) are on the 66th and 67th parallels. Sometimes the main chain has on the west two or three secondary chains, formed by the upheaval of sedimentary rocks, and it is towards the southern extremity of one of these that the highest peaks of the Urals occur (Sablya, 5135 ft., in 64° 47′ N., and Töll-poz-iz or Muraï-chakhl, 5535 ft. in 63° 55′). Dense forests, chiefly fir, pine and larch, clothe the slopes of the mountains and the narrow valleys; but, as the less hospitable latitudes are approached, every species except the larch gradually disappears and the upper limit of vegetation (2400 ft. in the south) rapidly descends till it reaches the very base of the mountains towards the Arctic Circle, and forest vegetation disappears altogether about 65° N. (67° in the plains of Russia and Siberia).

Although usually reckoned to the Northern Urals, the section between 64° and 61° N. has again a wholly distinct character. Here the main chain (or, more correctly, the main water-parting) of the Urals is a succession of plateaus stretching in a north-westerly direction, and dimpled with broad, flat, marshy valleys, rising here and there into isolated dome-shaped, flattened summits, mostly under 3000 ft. (Yang-tump, 62° 43′ N., 4170 ft.). The whole region, except the mountain summits, is densely clothed with coniferous forests, birch appearing only occasionally in the south, and even the Scotch pine only in a few valleys. This part of the range is also uninhabited.

The Middle Urals, between 61° and 55° 30′ N. and about 80 m. in breadth, are the best known, as they contain the richest iron, copper and gold mines (Bogoslovsk, Goroblagodatsk and Ekaterinburg Urals). The Denezhkin Kameñ in the north (5355 ft.) and the Tara-tash in the south (2800 ft.) may be considered as marking the limits of this section. Here the orographical structure is still more complicated. In the north (61st to 60th parallel) there is a succession of chains with a distinct north-eastern trend; and it still remains an open question whether, for two degrees farther south, the whole of the Bogoslovsk Urals (4795 ft. in the Konzhakovski-Kameñ, and from 3000 to 4000 ft. in several other summits) do not consist of chains having the same direction. South of Kachkanar (2885 ft.), *i.e.* from the 58th to the 56th parallel, the Urals assume the appearance of broad swellings 1000 to 2000 ft. in height, deeply trenched by ravines. These low and ravine-broken plateaus, the higher parts of which can be reached from Russia on a very gentle gradient, have been utilized for centuries as the chief highway to Siberia. The water-parting between the Russian and Siberian rivers is here not more than 1245 ft. above sea-level on the great Russo-Siberian highway (W. of Ekaterinburg). The eastern slope is steeper, but even there Ekaterinburg is only 435 ft. below the water-parting. The valleys have a decidedly south-eastern direction, and such is also the course of the railway from Perm to Tyumeñ, as soon as it reaches the Siberian slope. The Middle Urals are densely forested. The valleys and lower slopes are covered with a thick sheet of rich humus and have become the site of large and wealthy villages. The mines also support a considerable population.

The Southern Urals (55° 30′ to 51° N.), instead of being made up of three chains of mountains radiating from Mount Yurma, as was formerly supposed, consist of three parallel chains running north-east and south-west, and therefore constitute a quite independent part of the Ural system. The Urals proper are a low sinuous chain extending due south-west and hardly exceeding 2200 to 2800 ft. in altitude. They slope gently towards the north-west and abruptly towards the south-east, where several short, low spurs (Ilmeñ, Irenly) rise in the basins of the Miyas and the Ui. In the west a chain, separated from the main range, or Ural-tau, by a longitudinal valley, accompanies it throughout its entire length. This, although pierced by the rivers which rise in the longitudinal valley just mentioned (Ai, Upper Byelaya), nevertheless rises to a much greater height than the main range. Its wild stony crest reaches an extreme altitude of 5230 ft. Farther west, another series of chains reach nearly the same altitudes. The gorges by which the rivers pierce the Devonian limestones on their way towards the lower terraces are most picturesque in the west, where the Urals assume an alpine character. The forests are no longer continuous; the gentle slopes of the hilly tracts are dotted with woods, mostly of deciduous trees, while the hollows contain rich pasture grounds. The whole region, formerly the exclusive abode of the Bashkirs, is being colonized by Russians.

Farther south, between the 53rd and 51st parallels, the main range continues in the same direction, and, except when deeply trenched by the rivers, assumes the appearance of a plateau which hardly reaches 1500 ft. It is continued farther south-west (towards the Volga) under the name of Obshchiy Syrt.

As a rule, the Urals are not considered to continue south of the great bend of the Ural river, where quite independent ranges of hills, or flat swellings, appear (*e.g.* Dzhaman-tau, Mugodzhar Hills). It appears, however, that the Mugodzhar Hills may safely be regarded as an actual prolongation of the upheavals which constitute the Urals. These consist of diorites and crystalline slates, and reach their maximum in Aïryuk (1885 ft.). A range of heights connects the Mugodzhar Hills with the Ust-Urt plateau (see TRANSCASPIAN REGION).

Geology.—The Ural Mountains are no more than the western edge of a broad belt of folding of which the greater part is buried beneath the Tertiary deposits of western Siberia. Throughout the greater portion of the chain a broad strip of granites, diorites, peridotites, gneisses and other crystalline rocks rises directly from the Siberian plain, and is covered towards the west by Silurian, Devonian, Carboniferous, Permian and Triassic strata, which are thrown into numerous folds parallel to the length of the chain and usually rise to much greater heights than the crystalline zone. In the north, however, folded sedimentary rocks lie to the east as well as to the west of the crystalline axis, and between 60° 40′ and 46° 50′ N. Fedorov distinguishes three zones: (i.) the eastern hill region, where one finds Mesozoic rocks (Chalk, Jurassic) in the north, and Devonian limestones, porphyrites and quartz-porphyries farther south; in this zone most gold placers are found; (ii.) the central mountain zone consists of various amphibolitic metamorphic slates, and also of syenite and gabbro; granites, gneisses, and occasionally serpentines and porphyrites are found subordinately; and (iii.) the western hilly zone consists chiefly of Carboniferous and Permo-Carboniferous deposits; Middle and Upper Devonian limestones and, occasionally, crystalline slates are found in a few meridional ridges. The crystalline rocks are usually believed to be of Archean age. The Carboniferous deposits—coal-bearing in the Middle and Southern Urals—although appearing at the surface only as a narrow strip in the west Urals, occupy an extensive area, but are concealed by the largely developed Permian deposits, and that series of sediments which must be considered as intermediate between the Carboniferous and the Permian. These latter, described as "Permo-Carbon" by Russian and German geologists, are largely developed in the west Urals. The Permian deposits cover a wide zone all along the western slope of the Urals from north to south, and are most important on account of their copper ores, salt beds and salt springs. They are also covered with variegated marls which are almost destitute of fossil organisms, so that their age is not yet quite settled.

Climatic, Geo-Botanical and Geo-Zoological Importance.—The importance of the Urals as a climatic and geo-botanical boundary can no longer be regarded as very great. Most European species of plants freely cross the Urals into Siberia, and several Siberian species travel across them into northern Russia. But, being a zone of hilly tracts extending from north to south, the Ural Mountains necessarily exercise a powerful influence in pushing a colder northern climate, as well as a northern flora and fauna, farther south along their axis. The harshness of the climate at the meteorological stations of Bogoslovsk, Zlatoust and Ekaterinburg is not owing merely to their elevation a few hundred feet above sea-level. Even if reduced to sea-level, the average temperatures of the Ural meteorological stations are such as to produce a local deflexion of the isotherms towards the south. The same is true with regard to the limits of distribution of vegetable and animal species. The reindeer, for instance, is met with as far south as the 52nd parallel. The Southern Urals introduce into the Cis-Caspian steppes the flora and fauna of middle Russia.

In the distribution of the races of mankind the Urals have played an important part. To the present day the Northern Urals are inhabited by Finnish races (Samoyedes, Syryenians, Voguls and Permians) who have been driven from their former homes by Slav colonization, while the steppes on the slopes of the Southern Urals have continued to be inhabited by the Turkish Bashkirs. The Middle Urals were in the 9th century the abode of the Ugrians, and their land, Bjarmeland or Biarmia (now Perm), was well known to the Byzantine historians for its mineral wealth,—there being at that time a lively intercourse between the Ugrians and the Greeks. Compelled to abandon these regions, they moved (in the 9th century) south along the Ural slopes towards the land of the Khazars, and through the prairies of south-eastern and southern Russia (the Λεβεδία of Constantine Porphyrogenitus) towards the Danube and to their present seat—Hungary—leaving but very few memorials behind them in the Northern and Middle Urals.[1] At present the Urals, especially the Middle and the Southern, are being more and more colonized by Great Russian immigrants, while the Finnish tribes are rapidly melting away.

Metallurgy and Mining.—The mineral wealth of the Urals was known to the Greeks in the 9th century, and afterwards to the Novgorodians, who penetrated there in the 11th century for trade with the Ugrians. When the colonies of Novgorod (Vyatka, Perm) fell under the rule of Moscow, the Russian tsars soon grasped the importance of the Ural mines, and Ivan III. sent out German engineers to explore that region. In 1558 the whole of the present government of Perm was granted by the rulers of Moscow to the brothers Stroganov, who began to establish salt-works and mines for iron and copper. Peter the Great gave a new impulse to the mining industry by founding several iron-works, and from 1745, when gold was first discovered, the Russian colonization of the Urals took a new departure. The colonization was of a double character, being partly free—chiefly by Nonconformists in search of religious freedom—and partly compulsory,—the government sending peasant settlers who became serfs at the iron and copper works. Until 1861 all work at the mines was done by serfs belonging either to private persons (the Stroganovs, Demidovs and others) or to the crown. Not only are the Urals very rich in minerals, but the vast areas covered with forests afford an almost inexhaustible supply of cheap fuel for smelting purposes. Thus for a long time the Urals were the chief mining region in Russia. But when coal began to be used for smelting purposes, south Russia generally, and Ekaterinoslav in particular, became the chief iron-producing region. Attention has, however, again been directed to the great mineral wealth locked up in the mountain region, and the last two years of the 19th century witnessed a "boom" in the purchase of iron and gold mines by foreign companies. The chief pig-iron and iron-works are at Nizhniy-Tagilsk, and the principal steel-works at Bogoslovsk. The manufacture of agricultural machinery has increased in the southern Urals, especially at Krasno-ufimsk, and the manufacture of tea-urns has grown in importance at Perm.

Gold is met with in the Urals both in veins and in placers; the output increased from about 30,000 oz. in 1883 to three times that amount at the end of the century. The Urals have also rich placers of platinum, often mixed with gold, iridium, osmium and other rare metals, and supply annually some 13,000 lb, *i.e.* 95% of all the platinum obtained in the world. Silver, mercury, nickel, zinc and cobalt ores are found. Rich mines of copper are found at Turinsk, Gumishev and other places, yielding as much as 5% of pure copper; nickel is obtained at Revdinsk, and the extraction of iron chromates has developed. Coal exists in many places on the western slope of the Urals, mainly on the Yaiva river, in the basin of the Kama, and on the Usva (basin of the Chusovaya), and about 500,000 tons are raised annually. Several beds of coal have been found on the eastern slope; excellent anthracite exists at Irbit and good coal at Kamyshlov. Sapphires, emeralds, beryls, chrysoberyls, tourmalines, aquamarines, topaz, amethysts, rock-crystals, garnets and many kinds of jade, malachite and marble are cut and polished at several stone-cutting works, especially at Ekaterinburg; and diamond-mining may prove successful. Good asbestos is extracted, and pyrites is worked for the manufacture of sulphuric acid. Many varieties of mineral waters occur in the Urals, the best being those at Serginsk, Klyuchevsk and Elovsk.

(P. A. K.; J. T. BE.)

URALSK, a province of Asiatic Russia, lying N. of the Caspian Sea, with an area of 140,711 sq. m. It is bounded by the government of Astrakhan on the W., Samara and Orenburg on the N., Turgai and the Sea of Aral on the E., and the Caspian Sea and Transcaspian region on the S. It is geographically situated mostly within the boundaries of Asia, *i.e.* E. of the Ural river, and both its physical features and its inhabitants are, to a very large extent, Asiatic. Administratively, it belongs to the "Kirghiz provinces," or governor-generalship of the Steppes. Apart from a narrow strip of land in the north, where the slopes of the Obshchiy-Syrt plateau, covered with fertile black earth and stretches of forest, descend towards the Ural river, and the gentle slopes of the Mugojar Hills in the north-east, Uralsk consists of arid steppes and deserts, which incline with an imperceptible gradient towards the Caspian. Most of the province is below sea-level, the zero altitude line running from Kamyshin on the Volga to the south of the town of Uralsk.

Uralsk is drained by the river Ural or Yaik, which rises in Orenburg and flows south, west and south, entering the Caspian after a course of 900 m. Its chief tributaries, the Sakmara, the Qr and the Ilek, are in the north; along its lower course the Great and Little Uzeñ and many small streams on the left bank become lost in lakes before reaching the Ural. The Emba, which flows through the north of the Ust-Urt plateau, reaches the Caspian by a series of shallow lagoons, which were navigable in the 18th century.

The climate is influenced by the Central Asian steppes. A cold and dry winter is succeeded by a hot and still drier summer, during which the grass, and sometimes all the crops, are destroyed by the burning heat. Uralsk, although lying wholly to the south of 52° N., has the same average yearly temperature as Moscow and south Finland (39°·5); its January is colder than that of north Finland (3°), while July averages 73°.

The estimated population in 1906 was 730,300. It consists of three different elements—Ural Cossacks, who constitute about one-fifth; some 15,000 Russian peasants, and Kirghiz. The Kirghiz are almost entirely dependent on pastoral pursuits. The Cossacks, descendants of those independent communities of free settlers and Raskolniks who are so often mentioned in Russian history under the name of Yaik Cossacks, owing to their unwillingness to submit to the rule of the tsars, are fine representatives of the Great Russian race, though not without some admixture of Tatar and Kalmuck blood. Their chief occupations are live-stock breeding and fishing.

History.—In the first half of the 16th century Uralsk was occupied by the Nogai horde, a remnant of the Mongol Golden Horde, which retired there after the fall of Astrakhan and Kazan; the khans resided at Saraichik on the river Ural. At the same time the lower parts of the Ural were occupied by Russian runaway serfs and free Cossacks who did not recognize the authority of Moscow. They took Saraichik in 1560 and formed an independent community, like that of the Zaporogian Cossacks. When the Moscow princes attempted to bring them under their rule and prosecuted them for nonconformity, the Cossacks revolted, first under Stenka Razin (1667–71) and afterwards under Pugachev (1773–75). After the latter rising, the name of Ural was officially given to the Yaik river and the Yaik Cossacks. The disbanding of their artillery, the planting

[1] Comp. *Moravia and the Madiars*, by K. J. Groth; Zabyelin's *History of Russian Life*, and the polemics on the subject in *Izvestia* of the Russ. Geogr. Soc., xix. (1883).

of Russian garrisons within the domains of the *voisko*, and the interference of Russian officials in their interior organization during the 19th century occasioned a series of smaller outbreaks, the latest of which, in 1874, resulted in the deportation of 2500 Cossacks, with their families, to Turkestan.

URALSK, a town of Asiatic Russia, the capital of the province of the same name, on the Ural river, 165 m. W.S.W. of Orenburg, and 270 m. by rail E. of Saratov. Pop. (1885) 26,055; (1901) 38,919. It is rapidly developing owing to its trade with the nomad Kirghiz in cattle, sheep and animal products, all of which are exported to Russia; it is also a centre for trade in grain. It has two cathedrals, founded, one in the 18th century, the other in 1837; a small museum, a school farm, a people's palace, free libraries, and branches of the Russian Geographical and the Fisheries Societies.

URANIUM [symbol U, atomic weight 238·5 (O=16)], a metallic chemical element. In 1789 Klaproth isolated from pitchblende a yellow oxide which he viewed as the oxide of a new metal, which he named uranium, after the newly discovered planet of Herschel. By reducing the oxide with charcoal at a high temperature, he obtained a product which he took to be metallic uranium. Berzelius about 1823 found that the yellow oxide, when treated with excess of sulphuric acid, gave a sulphate not unlike the ferric salt. He concluded that the uranium salt was $Ur_2O_33SO_3$, where Ur_2O_3, according to his analysis, represents 864 parts of yellow oxide (O=16). Like Fe_2O_3, the yellow oxide lost 48 parts of oxygen per Ur_2O_3 (=864 parts) as water, while Ur_2=816 parts of metal remained. These results were adopted until Péligot in 1840 discovered that Berzelius's (and Klaproth's) metal contains oxygen, and that his $(Ur_2)O_3$ really is $(U_6O_6)\cdot O_3=3U_2O_3$, where U=120 is one equivalent weight of real uranium. Péligot's results, though called in question by Berzelius, have been amply confirmed by all subsequent investigators; only now, on theoretical grounds, first set forth by Mendeléeff, we double Péligot's atomic weight, so that U now signifies 240 parts of uranium, while UO_3 stands as the formula of the yellow oxide, and UO_2 as that of Berzelius's metal.

The only practically available raw material for the extraction of uranium is pitchblende (*q.v.*). Pure pitchblende is U_3O_8, which, in relatively good specimens, forms some 80% or more of the whole. It is remarkable as always containing helium (*q.v.*) and radioactive elements (see RADIOACTIVITY). To extract the metal, the pitchblende is first roasted in order to remove the arsenic and sulphur. In one process the purified ore is disintegrated with hot nitric acid to produce nitrates, which are then converted into sulphates by evaporation with sulphuric acid. The sulphates are treated with water, which dissolves the uranium and other soluble salts, while silica, lead sulphate, &c., remain; these are removed by filtration. From the solution the arsenic, copper, &c., are precipitated by sulphuretted hydrogen as sulphides, which are filtered off. The filtrate contains the uranium as uranous and the iron as ferrous salt. These are oxidized and precipitated conjointly by excess of ammonia. The precipitate, after having been collected and washed, is digested with a warm concentrated solution of ammonium carbonate, which dissolves the uranium as a yellow solution of ammonium uranate, while the hydrated oxide of iron, the alumina, &c., remain. These are filtered off hot, and the filtrate is allowed to cool, when crystals of the uranate separate out. The mother liquor includes generally more or less of nickel, cobalt, zinc and other heavy metals, which, as Wöhler showed, can be removed as insoluble sulphides by the addition of ammonium sulphide; uranium, under the circumstances, is not precipitated by this reagent. The filtrate, on being boiled down, yields a second crop of uranate. This uranate when ignited in a platinum crucible leaves a green oxide of the composition U_3O_8, *i.e.* artificial pitchblende, which serves as a starting-point for the preparation of uranium compounds. The green oxide, as a rule, requires to be further purified. One method for this purpose is to convert it into a solution of the nitrate $UO_2(NO_3)_2$, and from it to precipitate the metal as oxalate by oxalic acid (Péligot). The latter $(UO_2\cdot C_2O_4)$ yields a purer oxide, UO_2, or, in the presence of air, U_3O_8, on ignition.

Metallic uranium, as shown by Péligot, can be obtained by the reduction of a mixture of dry chloride of potassium and dry uranous chloride, UCl_4, with sodium at a red heat. A better process is that of H. Moissan (*Compt. rend.*, 1896, 122, p. 1088), in which the oxide is heated with sugar charcoal in the electric furnace. Uranium is a white malleable metal, which is pretty hard, though softer than steel. Its specific gravity has the high value 18·7; its specific heat is 0·02765, which, according to Dulong and Petit's law, corresponds to U=240. It melts at bright redness. The compact metal when exposed to the air tarnishes only very slowly. The powdery metal when heated in air to 150° or 170° C. catches fire and burns brilliantly into U_3O_8; it decomposes water slowly at ordinary temperatures, but rapidly when boiling. It burns in oxygen at 170°, in chlorine at 180°, in bromine at 210°, in iodine at 260°, in sulphur at 500°, and combines with nitrogen at about 1000°. Dilute sulphuric acid attacks it but slowly; hydrochloric acid, especially if strong, dissolves it readily, with the formation, more immediately, of a hyacinth-coloured solution of U_2Cl_6, which, however, readily absorbs oxygen from the air, with the formation of a green solution of UCl_4, which in its turn gradually passes into one of yellow uranyl salt, $UO_2\cdot Cl_2$.

Uranium is chemically related to chromium, molybdenum and tungsten. If forms two series of salts, one, the uranous compounds, are derived from the oxide UO_2, the other, the uranyl compounds, contain the divalent group UO_2.

Uranous Compounds.—Uranium dioxide, UO_2 (Berzelius's metal), is a brown to copper-coloured powder, obtained by heating U_3O_8 or uranyl oxalate in hydrogen. It fires when heated in air, and dissolves in acids to form uranous salts. It may be obtained as jet black octahedra (isomorphous with thoria) by fusion with borax. Uranous hydrate is obtained as reddish-brown flakes by precipitating a uranous solution with alkali. The solution in sulphuric acid deposits green crystals of the sulphate, $U(SO_4)_2\cdot 8H_2O$, on evaporation. Uranous chloride, UCl_4, was first prepared by Péligot by heating an intimate mixture of the green oxide and charcoal to redness in a current of dry chlorine; it is obtained as sublimate of black-green metallic-looking octahedra. The chloride is very hygroscopic. By heating in hydrogen it yields the trichloride, UCl_3, and by direct combination with chlorine the pentachloride, UCl_5. With hydroflouric acid it yields uranous fluoride, UF_4, which forms double salts of the type $MF\cdot UF_4$. Uranous bromide, UBr_4, and uranous iodide, UI_4, also exist.

Uranyl or Uranic Compounds.—Uranic oxide, UO_3 or $UO_2\cdot O$, is obtained by heating uranyl nitrate to 250° as a yellow solid, insoluble in water, but soluble in acids with the formation of uranyl salts. Various hydrates have been described, but they cannot be formed by precipitating a uranyl salt with an alkali, this reagent giving rise to salts termed *uranates.* These salts generally resemble the bichromates; they are yellow in colour, insoluble in water, soluble in acids, and decomposed by heat. Sodium uranate, $Na_2U_2O_7$, is used as a pigment for painting on glass and porcelain under the name of uranium yellow. It is manufactured by heating pitchblende with lime, treating the resulting calcium uranate with dilute sulphuric acid, and adding sodium carbonate in excess. Dilute sulphuric acid precipitates uranium yellow, $Na_2U_2O_7\cdot 6H_2O$, from the solution so obtained. Ammonium uranate heated to redness yields pure U_3O_8, which serves as a raw material for uranium compounds. Uranyl nitrate, $UO_2(NO_3)_2\cdot 6H_2O$, is the most important uranium salt. It is obtained as fine lemon yellow deliquescent prisms by evaporating a solution of any of the oxides in nitric acid. By electrolysis it yields uranium dioxide as a pyrophoric powder, and peruranic hydroxide, $UO_4\cdot 2H_2O$, when treated with hydrogen peroxide. The latter gives rise to salts, the peruranates, *e.g.* $(Na_2O_2)_2UO_4\cdot 8H_2O$. Uranyl nitrate is used in photography, and also in analytical chemistry as a precipitant for phosphoric acid (as uranyl ammonium phosphate, $UO_2\cdot NH_4\cdot PO_4$). Uranyl chloride, UO_2Cl_2, is a yellow crystalline mass formed when chlorine is passed over uranium dioxide at a red heat. It is also obtained by dissolving the oxide in hydrochloric acid and evaporating. It forms double salts with metallic chlorides and with the hydrochlorides of organic bases. Uranyl sulphide, UO_2S, is a black precipitate obtained by adding ammonium sulphide to a uranyl solution. Exposed to air this mixture is oxidized to the pigment *uranium red*, $U_8(NH_4)_2SO_9$, which is a fine blood-coloured amorphous powder.

Analysis.—A borax bead dissolves uranium oxides in the reducing flame with a green, in the oxidizing flame with a yellow, colour. Solutions of uranyl salts (nitrate, &c.) behave to reagents as follows: sulphuretted hydrogen produces green uranous salt with precipitation of sulphur; sulphide of ammonium in neutral solutions gives a black precipitate of UO_2S, which settles slowly and, while being washed in the filter, breaks up partially into hydrated UO_2 and sulphur; ammonia gives a yellow precipitate of uranate of ammonia, characteristically soluble in hot carbonate of ammonia solution; prussiate of potash gives a brown precipitate which in appearance is not unlike the precipitate produced by the same reagent in cupric salts.

URANUS, in astronomy, the seventh major planet in the order of distance from the sun, and denoted by the symbol ⛢ or ♅. It was discovered by the elder Herschel on the

13th of March 1781. He saw it as a round nebulous disk, slowly moving among the stars, and at first supposed it to be a comet, and announced it as such to the Royal Society. But a few weeks' observation showed it to be moving in a nearly circular orbit at a distance from the sun about nineteen times that of the earth. Its planetary character was thus established, and Herschel named it the *Georgium Sidus* in honour of his royal patron. This name was long recognized in England, and "the Georgian" was officially used in the Nautical Almanac up to 1850. But it was never received with favour on the continent of Europe, nor was that of the discoverer, which was proposed by Lalande. The name Uranus was proposed by Bode, and adopted everywhere outside of England.

As seen in a telescope of the highest power, Uranus presents to the eye the appearance of a disk about four seconds in diameter of a faint sea-green tint. No trace of a marking can be seen on the surface, and, so far as measures have yet been made on it, no deviation of the disk from a circular form has been established. Nothing is therefore known as to its axial rotation. Although the planet is commonly considered a telescopic one, it is really of the sixth magnitude, and therefore faintly visible to the naked eye if one knows precisely where to look for it. Long before its discovery it had been observed as a fixed star by J. Flamsteed. P. C. Lemonnier also made eight observations of it during the opposition of 1768–69, which would have revealed its planetary character had he reduced and compared them. For other particulars relating to Uranus, its spectrum, &c., see PLANET.

Satellites of Uranus.—In January 1787 Herschel detected two satellites of Uranus of which the inner one, now known as Titania, had a period of 9 days, the outer, Oberon, of 13½ days. He also on other occasions saw what he supposed to be two additional satellites, but careful investigation of his observations has shown that the supposed objects could not have been of this character. But in 1851–52 William Lassell at Malta, in conjunction with his assistant A. Marth, observed two satellites yet nearer the planet than those of Herschel. These are now known as Ariel and Umbriel. Their periodic times are about 2½ and 4 days respectively. Lassell's telescopes, which were reflectors, were superior to others of his time in light-power, and these inner satellites were not seen by other astronomers for more than twenty years after their discovery. Indeed, doubts of their reality sometimes found expression until, in 1873, they were observed with the Washington 26-inch telescope, and observations upon them showed their identity with the objects discovered by Lassell. The greater difficulty in seeing the inner than the outer satellites arises from their proximity to the planet. There is no very great difference in the actual brightness of the four objects. It is found that Umbriel, though less easy to see than Titania, actually exceeds it in light. But none of them has been seen except in a few of the most powerful telescopes. The most remarkable feature of these bodies is that, instead of the planes of their orbits being near that of the ecliptic, they are actually inclined to it nearly 90°. The result is that, as the planet performs its orbital revolution, there are two opposite points near which the orbits are seen edgewise, and the satellites seem to us to swing north and south on each side of the planet. This was the case in 1882, and will be the case again in 1924. At the points midway between these two, through which the planet passed in 1861 and 1903, and will pass again in 1945, the orbits are seen almost perpendicularly, so that the apparent orbit, like the real one, is nearly circular.

Orbits of the Satellites of Uranus.—So far as has yet been determined, the four satellites all revolve in the same plane, the position of which, referred to the Earth's equator and equinox, is—

R.A. of ascending node, $166°\cdot05+0°\cdot01420t$.
Inclination of orbit, $75°\cdot28-0°\cdot0013t$.

None of the orbits seems to have a measurable eccentricity. The positions of the satellites in the orbits at any time may be found from the following elements, where u is the angular distance from the node upon a plane parallel to that of the Earth's equator, and the motion is that in a Julian year.

Satellite.	u at Epoch.	Annual Motion.	Daily Motion.	Mean Dist.
Ariel . .	22°·61	579 rev. +242°·64	142°·836	13″·78
Umbriel . .	136°·49	352 „ +195°·31	86°·869	19″·20
Titania . .	229°·93	167 „ +294°·20	41°·351	31″·48
Oberon . .	154°·90	108 „ +186°·27	26°·739	42″·10

The epoch force is 1872, January 0, Washington mean noon. The mean distance is the angle subtended by the radius of the orbit as seen at the mean distance of Uranus from the Sun ($\log a=1\cdot28310$).

BIBLIOGRAPHY.—Details as to Uranus are found in Chambers's *Descriptive Astronomy*, and all the current treatises on popular astronomy. For researches on the spectrum of the planet see Sir William Huggins in *Proceedings of the Royal Society*, vol. xix., (1871); H. C. Vogel, *Astrophysical Journal*, vol. i.; and P. Lowell, *Bulletin of the Lowell Observatory*, No. 13. Tables of the motions of this planet were published by Alexis Bouvard in 1813, S. Newcomb in 1873 (*Smithsonian Contributions to Knowledge*, No. 262), Leverrier in 1877 (*Annales de l'observatoire de Paris, Mémoires*, tome xiv.), and Newcomb again in *Astronomical Papers of the American Ephemeris*, vol. vii. Tables of the four satellites are found in Newcomb, *Uranian and Neptunian Systems* (Appendix I. to *Washington Observations* for 1873). Observations are found in the Bulletins of the Lick Observatory and elsewhere. (S. N.)

URANUS (Heaven), in Greek mythology, the husband of Gaea (Earth), and father of Cronus (Saturn) and other deities. As such he represents the generative power of the sky, which fructifies the earth with the warmth of the sun and the moisture of rain. For the legend of his treatment by Cronus and its meaning, see SATURN. Uranus and other Greek gods anterior to Zeus were probably deities worshipped by earlier barbarous inhabitants of the land.

The Roman Caelus (or Caelum) is simply a translation of the Greek Οὐρανός, not the name of a distinct national divinity. There is no evidence of the existence of a cult of Caelus, the occurrence of the name in dedicatory inscriptions being due to Oriental influences, the worship of the sky being closely connected with that of Mithras. Caelus is sometimes associated with Terra, represented in plastic art as an old, bearded man holding a robe stretched out over his head in the form of an arch.

See Wissowa, *Religion der Römer* (1902), p. 304, and his article in Pauly-Wissowa's *Realencyclopädie*, iii. pt. 1 (1897); also Steuding in Roscher's *Lexikon der Mythologie* and De Vit's *Onomasticon* (suppt. to Forcellini's *Lexicon*).

URA-TYUBE, or ORA-TEPE, a town of Russian Turkestan, in the province of Samarkand, lying 37 m. S.W. of Khojent, on the road from Ferghana to Jizak across the Zarafshan range. Pop. (1900) 22,088, chiefly Uzbegs. It is surrounded by a wall and has a citadel. The inhabitants carry on trade in horses and camel-wool cloth, and manufacture cottons, boots and shoes, oil, and camel's-hair shawls. Ura-tyube is supposed to have been founded by Cyrus under the name of Cyropol, and was taken in 329 B.C. by Alexander the Great of Macedon. Later it was the capital of an independent state, though often held by either Bokhara or Kokand. The Russians took it in 1866.

URBAN (Urbanus), the name of eight popes.

St URBAN, first pope of that name, was bishop of Rome from 222 to 230. He had been preceded by Calixtus, and was followed by Pontianus.

URBAN II. (Odo or Otho or Eudes de Lagary), pope from the 12th of March 1088 to the 29th of July 1099, was born of knightly rank at Lagary (or Lagery or Lagny), near Reims. He studied for the church, became archdeacon of Auxerre, and later joined the congregation of Cluny. Displaying great ability as reformer and theologian, he was chosen subprior of the celebrated monastery. He was created cardinal-bishop of Ostia in 1078 by Gregory VII., to whom he displayed such loyalty, especially as papal legate in Germany (1084), that he was imprisoned for a time by Henry IV. He was designated by Gregory as one of four men most worthy to succeed him, and, after a vacancy of more than five months following the decease of Victor III., he was elected pope on the 12th of March 1088 by forty cardinals, bishops, and abbots assembled at Terracina, together with representatives of the Romans and of Countess Matilda. He frankly took up the policy of Gregory VII., but, while pursuing it with equal determination, showed greater flexibility and diplomatic skill. Throughout the major part of his pontificate he had to reckon with the presence of the powerful antipope Clement III. (Guibert of Ravenna) in Rome; but a series of well-attended synods at Rome, Amalfi, Benevento and Troia, supported him in renewed declarations against simony, lay investiture, and clerical marriages, and in a policy of continued opposition to Henry IV. He maintained an alliance with the Norman Duke Roger, Robert Guiscard's son and successor, and united the German with the Italian opposition to the emperor by promoting the marriage of the Countess Matilda with young Welf of Bavaria. He aided Prince Conrad in his rebellion against his father and crowned him king of the Romans at Milan in 1093, and likewise encouraged the Empress Praxedis in her charges against her husband. By excommunicating Philip I. of France for matrimonial infidelity in 1095, Urban opened a struggle which was not terminated until after his death. Invited to Tuscany by the Countess Matilda, he convoked a council at Piacenza in March 1095, attended by so vast a number of prelates and laymen that its sessions were held in the open air, and addressed by ambassadors of Alexis, the Byzantine emperor, who sought aid against the Mussulmans. Urban crossed the Alps in the summer, and remained over a year in France and Burgundy, being everywhere reverently received. He held a largely attended council at Clermont in November 1095, where the preaching of the First Crusade marked the most prominent feature of Urban's pontificate. Thenceforth until his death he was actively engaged in exhorting to war against the infidels. Crusaders on their way through Italy drove the antipope Clement III. finally from Rome in 1097, and established Urban firmly in the papal see. With a view to facilitating the crusade, a council was held at Bari in October 1098, at which religious differences were debated and the exiled Anselm of Canterbury combated the Eastern view of the Procession of the Holy Ghost. Urban died suddenly at Rome on the 29th of July 1099, fourteen days after the capture of Jerusalem, but before the tidings of that event had reached Italy. His successor was Paschal II.

It is well established that Urban preached the sermon at Clermont which gave the impetus to the crusades. The sermon was written out by Bishop Baudry, who heard it, and is to be found in full in J. M. Watterich, *Pontif. Roman. Vitae*. Letters of Urban are published in J. P. Migne, *Patrol. Lat.*, vol. 151.

See J. Langen, *Geschichte der römischen Kirche von Gregor VII. bis Innocenz III.* (Bonn, 1893); F. Gregorovius, *Rome in the Middle Ages*, vol. 4, trans. by Mrs G. W. Hamilton (London, 1900–2); K. Quartalschrift* (1897).

URBAN III. (Uberto Crivelli), pope from the 25th of November 1185 to the 20th of October 1187, was a Milanese, and had been made cardinal-priest of St Lorenzo in Damaso and archbishop of Milan by Lucius III., whom he succeeded. His family had suffered greatly at the hands of Frederick I., and he now took up vigorously his predecessor's quarrels with the emperor, including the standing dispute about the territories of the Countess Matilda. His opposition to the pretensions of the Roman senate to govern the Papal States, moreover, compelled him to remain in exile through his pontificate. He suspended the patriarch of Aquileia for crowning the emperor's son, Henry, king of Italy (January 1186), in violation of his own rights as archbishop of Milan; and only the entreaties of the citizens of Verona, where he was stopping, prevented him from excommunicating Frederick. In 1187 he exhorted the Christian kings to renewed endeavours in the Holy Land, and the fall of Jerusalem on the 2nd of October is said to have caused his death. He died at Ferrara and was succeeded by Gregory VIII. His letters are in J. P. Migne, *Patrol. Lat.*, vol. 202.

See J. Langen, *Geschichte der römischen Kirche von Gregor VII. bis Innocenz III.* (Bonn, 1893); Jaffé-Wattenbach, *Regesta pontif. Roman.* (1885–88); F. Gregorovius, *Rome in the Middle Ages*, vol. 4, trans. by Mrs G. W. Hamilton (London, 1896); P. Scheffer-Boichorst, *Friedrichs I. letzter Streit mit der Curie* (Berlin, 1866); W. Meyer, "Zum Streite Kaiser Friedrichs I. mit Papst Urban III.," in *Forschungen zur deutschen Geschichte*, vol. 19 (1879).

URBAN IV. (Jacques Pantaléon), pope from the 29th of August 1261 to the 2nd of October 1264, was the son of a shoemaker of Troyes. Having received a monastic education, he became archdeacon of Liége and papal legate of Innocent IV. to Poland and Prussia; he was consecrated bishop of Verdun in 1253, and two years later was translated to the patriarchate of Jerusalem. While on a trip to Italy to explain at court a quarrel with the Hospitallers he was elected to succeed Alexander IV., after a three months' vacancy in the Holy See. He never visited Rome, but lived most of his pontificate at Orvieto. He favoured his own countrymen, and under him began that preponderance of the French in the curia which later led to the papal residence at Avignon, and indirectly to the Great Schism. He endeavoured without success to stir up Louis IX. of France to undertake a new crusade. In 1264 he instituted the festival of Corpus Christi. His chief domestic problems arose out of the competing claims for the crown of the Two Sicilies. He favoured Charles of Anjou, and declared in June 1263 that the papal grant of the kingdom to Edmund, son of Henry III. of England, had expired because of the latter's inability to oust the usurper Manfred. Urban died before the arrival of Charles of Anjou, and was succeeded by Clement IV.

The registers of Urban IV. have been published by L. Dorez and J. Guiraud in the *Bibliothèque des écoles françaises d'Athènes et de Rome* (Paris, 1892).

Potthast, *Regesta pontif. Roman.* (Berlin, 1875).

URBAN V. (Guillaume Grimoard or Grimaud de Beauvoir), pope from the 28th of October 1362 to the 19th of December 1370, was born in 1309 near Lozère in Languedoc, and entered the Benedictine priory of Chiriac. After receiving orders he became successively professor of canon law at Avignon and Montpellier, vicar-general of the dioceses of Clermont and Uzès, abbot of St Germain d'Auxerre, abbot of St Victor at Marseilles, administrator of the bishopric of Avignon, and papal legate to Naples. He was returning from his mission to Italy when news reached him at Corneto that he had been chosen to succeed Innocent VI. He announced his acceptance from Marseilles, and was consecrated at Avignon on the 6th of November 1362. Urban witnessed the completion of the work of tranquillizing Italy under the able Cardinal Albornoz, and in 1364, in the interests of peace, made heavy concessions to Bernabo Visconti. Moved by Peter of Lusignan, king of Cyprus, and by the celebrated Carmelite Peter Thomas, who had come to Avignon in February 1363, the pope proclaimed another crusade, which found some echo in France and resulted in the temporary occupation of Alexandria (1365). Urban, yielding to the entreaties of the Emperor Charles IV. and of Petrarch, left Avignon on the 30th of April 1367, despite the opposition of the French cardinals, and made his entry into Rome on the 16th of October. The following year he was visited by Charles IV., and crowned the Empress Elizabeth (1st of November); and in 1369 he received the Greek emperor, John Palaeologus, who renounced the schism but for whom the pope was unable to secure assistance. Urban sanctioned the order of Jesuates and founded the medical school at Montpellier. On account of the poor repair of Rome, the restlessness of the Romans and the discontent of the French cardinals in Italy, he at length announced his intention of returning to France, avowedly to settle trouble between France and England. He took ship at Corneto on the 5th of September 1370, and, arriving at Avignon on the 24th of the same month, died on the 19th of December. Urban was serious and humble, opposed to all nepotism, simony, and secular pomp. He was himself of blameless morality and reformed many abuses in the curia. He was honoured as a saint immediately after his death, and beatified by Pius IX. in 1870. Urban's successor was Gregory XI.

Milman, *Latin Christianity*, vol. 7 (London, 1896); J. B. Christophe, *Histoire de la papauté pendant le XIVème siècle*, vol. 2 (Paris, 1853).

Urban VI. (Bartolommeo Prignano), pope from the 8th of April 1378 to the 15th of October 1389, was born at Naples in 1318. He was made bishop of Acerenza in 1364, and in 1377 was translated to the archiepiscopal see of Bari and placed in charge of the papal chancery. On the death of Gregory XI., who had finally returned to Rome from Avignon, he was elected pope in a conclave held under circumstances of great excitement, owing to popular apprehension of an intention of the French cardinals to elect a French pope and again abandon Rome. The populace broke into the hall after the election had been made and dispersed the cardinals, but the latter returned and confirmed their action on the following day. Urban VI. turned his attention at once to the reformation of the higher clergy, and, in spite of the warnings of Catherine of Siena, so angered the cardinals by his harsh and ill-tempered measures that they assembled at Anagni in July 1378, and revoked his election, in which they declared they had acted under fear of violence. On the 20th of September they elected at Fondi the Cardinal Robert of Geneva, who called himself Clement VII. and took up his residence at Avignon. Urban, on the other hand, remained at Rome, where he appointed twenty-six new cardinals and excommunicated Clement and his adherents. Thus began the Great Schism which divided the Western Church for about fifty years. Urban deposed Joanna of Naples (21st of April 1380) for adhering to France and Savoy in support of the antipope, and gave her kingdom to Charles of Durazzo. Charles was crowned at Rome on the 1st of June 1381, but three years later quarrelled with the pope and shut him up in Nocera. Urban succeeded in escaping to Genoa, where he put several of his cardinals to death for suspected disloyalty. On the death of Charles he set out with an army apparently to seize Naples for his nephew if not for himself. To raise funds he proclaimed, by bull of the 11th of April 1389, a jubilee for every thirty-three years, but before the celebration could be held he died of injuries caused by a fall from his mule. Urban was frugal and never practised simony, but harshness, lack of tact, and fondness for unworthy nephews disgraced his pontificate. He was succeeded by Boniface IX.

The chief sources for the life of Urban VI. are in Baluzius, *Vitae Pap. Avenion.* (Paris, 1693); *Theoderici de Nyem De schismate Libri tres*, ed. by G. Erler (Leipzig, 1890); Sauerlande, "Actenstücke zur Gesch. des Papstes Urban VI.," in *Hist. Jahrbuch der Görres-Gesellschaft*, xiv. (1893); "Acta Urbani VI. et Bonifatii IX.," ed. C. Krofta, in *Monumenta vaticana res gestas Bohemicas illustrantia* (Prague, 1905); *Der Liber Cancellariae Apostolicae vom Jahre 1380*, ed. by G. Erler (Leipzig, 1888); *Il Trattato di S. Vincenzo Ferrer intorno al grande schisma d'Occidente*, ed. by A. Sorbelli (Bologna, 1906).

Urban VII. (Giovanni Battista Castagna), successor of Sixtus V., was born on the 4th of August 1521. He became governor of Bologna, archbishop of Rossano, and was long nuncio to Spain. Gregory XIII. made him a cardinal, 1583; and in 1590 he was elected pope by the Spanish faction, but died twelve days later, on the 27th of September 1590, and was succeeded by Gregory XIV.

See Ciaconius, *Vitae et res gestae summorum Pontiff. Rom.* (Rome, 1601–2); Cicarella, continuator of Platina, *De vitis Pontiff. Rom.* (both contemporary; the latter prolix and tedious); Arrigho, *Vita Urbani VII.* (Bologna, 1614); and Ranke, *Popes* (Eng. trans., Austin), ii. 227.

Urban VIII. (Maffeo Barberini), pope from 1623 to 1644, was born in 1568, of a wealthy Florentine family. He early entered the prelacy, became prefect of Spoleto, twice nuncio to France, cardinal (1606), and finally, on the 6th of August 1623, succeeded Gregory XV. as pope. Urban was vain, self-willed and extremely conscious of his position; he accepted the papacy chiefly as a temporal principality, and made it his first care to provide for its defence and to render it formidable. He built Castelfranco on the northern frontier; fortified the port of Civita Vecchia; and strengthened the Castel Sant' Angelo, equipping it with cannon made from the bronze of the Pantheon, an act of vandalism which the Romans punished by the epigram, "Quod non fecerunt barbari, fecerunt Barberini." He also established an arsenal and a factory of arms. But all this provision was to no purpose. The only territory gained during Urban's pontificate, the duchy of Urbino, the last addition to the papal states, was acquired by reversion (1631); and in his one war, with the duke of Parma, for the district of Castro, he met defeat and humiliation (1644). The Thirty Years' War Urban professed to regard as waged for political, not for religious, ends. He therefore took counsel merely with his interest as a temporal prince, threw in his lot with France, supported the duke of Nevers in the Mantuan Succession, and, under stress of fear of Habsburg supremacy, suffered himself to be drawn into closer relations with the Protestants than beseemed his office, and incurred the reproach of rejoicing in the victories of heretics. Later, in keeping with his position, he opposed all concessions to the Protestants; but still showed himself so vacillating that the papacy ceased to be regarded as a serious political factor, and was entirely ignored in the final settlement of Westphalia, 1648.

Urban was the last pope to practise nepotism on a grand scale. He failed to found a princely house; but he enriched his family to an extent that astonished even the Romans. Urban bore a hand in the condemnation of Galileo. He acknowledged the genius of the astronomer, and had not approved of the action of the Inquisition in 1616; but subsequently, believing himself to have been caricatured in the *Dialogo*, he permitted the Inquisition to have its way and to compel an abjuration (1633). Urban also denounced the doctrines of Jansen, 1644 (see Jansenism). He promulgated the famous bull *In Coena Domini* in its final form, 1627; published the latest revision of the Breviary, 1631; founded the College of the Propaganda for the education of missionaries, 1627; and accorded the title of "eminence" to the cardinals, 1630. Urban did much to embellish the city. Conspicuous among his works are the Barberini Palace, the College of the Propaganda, the Fountain of the Triton, and the baldachin of St Peter's. His hymns and poems, which have frequently been published, are evidence of his literary taste and ability. Urban died on the 29th of July 1644, and was succeeded by Innocent X.

For contemporary accounts of Urban see: Tommasucci, in Platina, *De vitis Pontiff. Rom.*; Oldoin, continuator of Ciaconius, *Vitae et res gestae summorum Pontiff. Rom.*; and Simonin, *Gesta Urbani* (Antwerp, 1637). A rich collection of materials was made by Andrea Niccoletti, *Della vita di Papa Urbano VIII. e storia del suo pontificato*, never published, but extensively used by Ranke and others. See also Ranke, *Popes* (Eng. trans., Austin), ii. 552 seq., iii. 1 seq., 21 seq.; v. Reumont, *Gesch. der Stadt Rom*, iii. 2, 611 seq., 702 seq.; Santa Pieralisa, *Urbano VIII. e Galileo Galilei* (Rome, 1875); Gregorovius, *Urban VIII. im Widerspruch zu Spanien u. dem Kaiser* (Stuttgart, 1879); and Weech, *Urban VIII.* (London, 1905). (T. F. C.)

URBANA, a city and the county-seat of Champaign county, Ohio, U.S.A., about 47 m. W. by N. of Columbus. Pop. (1890) 6510; (1900) 6808, including 796 negroes and 405 foreign-born; (1910) 7739. Urbana is served by the Erie, the Pittsburg, Cincinnati, Chicago & St Louis, and the Cleveland, Cincinnati, Chicago & St Louis railways, and by the Ohio Electric interurban line. It has a public library (1890) and a county children's home (1892), and is the seat of Urbana University (co-educational), founded in 1850 under the auspices of the New Church. The city is situated in a fertile farming region. Its manufactures include furniture, telephones, woollen goods, paper, foundry and machine-shop products, &c. Urbana was laid out in 1805 by Colonel William Ward, of Greenbriar, Va., who owned the land included in the original survey and gave many lots to the county on condition that the proceeds from their sale should be used for public improvements; it was incorporated as a village in 1816 and was chartered as a city in 1867. Colonel Ward was the grandfather of the sculptor J. Q. A. Ward, who was born here and here first pursued, unaided, his study of art. Urbana was also the home for several years (after 1802), and is the burial place, of Simon Kenton, the famous pioneer and Indian fighter.

URBINO (anc. *Urvinum Mataurense*), a city and archiepiscopal see of the Marches, Italy, in the province of Pesaro and Urbino, 19 m. direct S.W. of Pesaro and 50 m. by rail N. by W. of Fabriano, a junction on the line from Ancona to Rome. Pop. (1901) 6809 (town), 18,244 (commune). It is picturesquely situated on an abrupt hill 1480 ft. above sea-level; its streets are narrow and crooked, and the town has a medieval aspect. It is dominated by the ducal palace erected by Luciano da Laurana, a Dalmatian architect, in 1460–82, for Federigo Montefeltro, and regarded by the contemporaries of the founder as the ideal of a princely residence. The sculptured doorways, chimneys and friezes of the interior are especially fine. Some are by Domenico Rosselli of Florence, others by Ambrogio d'Antonio da Milano. The rich and beautifully executed intarsia work may be due to Baccio Pontelli. The massive irregularity of the exterior is due to the unevenness of the site. The decoration of the exterior was never completed; but the arcaded courtyard is the finest of the Renaissance, except perhaps that of the Cancelleria at Rome (Burckhardt). The palace is now partly used for government purposes, and also contains the municipal archives, a collection of ancient inscriptions, formed by the epigraphist Raffaele Fabretti (many of them from Rome), a gallery of sculpture of various periods and a picture gallery. This last contains a small but interesting collection of pictures, including works by Paolo Uccello, Giovanni Santi, Justus of Ghent, Timoteo della Vite, and other 15th-century artists, also a "Resurrection" by Titian (a late work). The picture of the "Last Supper" by Justus is specially valuable from its containing fine portraits of the Montefeltro family and members of the ducal court. The cathedral, a building of no special interest, stands in the great piazza close to the ducal palace. It was erected in 1801 after the collapse of the former structure. In the sacristy there is a very beautiful miniature-like painting of the "Scourging of Christ," by Piero della Francesca, and other pictures by later artists. In the crypt there is a fine pietà in marble by Giovanni da Bologna. Opposite the palace is the church of S. Domenico, a Gothic building with a good early Renaissance portal and a relief in the lunette by Luca della Robbia (1449). The interior was spoilt in the 17th century. S. Francesco has a fine 14th-century loggia and campanile, and a handsome portal of a chapel in the interior by Constantino Trappola (15th century). S. Bernardino, outside the town, is a plain early Renaissance structure. On the walls of the chapel of the gild or confraternity of San Giovanni Battista are some valuable early frescoes, painted by Lorenzo and Giacomo Salimbene da San Severino in 1416. In the church of S. Spirito are two paintings by Luca Signorelli, the "Crucifixion" and the "Day of Pentecost," originally intended for a processional banner. The modest house where Raphael was born and spent his boyhood is preserved. It is now the property of a society of artists. Its rooms form a museum of engravings and other records of Raphael's works, together with a picture of the Madonna by his father, Giovanni Santi, formerly thought to be by Raphael himself. A monument was erected to him in the piazza in 1897. The theatre, decorated by Girolamo Genga, is one of the earliest in Italy; in it was performed the first Italian comedy, the *Calandria* of Cardinal Bibbiena, the friend of Leo X. and Raphael. The magnificent library formed by the Montefeltro and Della Rovere dukes was removed to Rome, and incorporated in the Vatican library (but with a separate numbering) in 1657. There is a free university founded in 1564 which has two faculties (with 163 students in 1902–03), and also a technical school. The town has manufactures of silk, majolica and bricks.

The ancient town of *Urvinum Mataurense* (taking its name from the river Mataurus or Metaurus) is mentioned a few times in classical literature, and many inscriptions relating to it exist. The course of its walls can still be traced. It was an important place in the Gothic wars, and is frequently mentioned by Procopius. At the end of the 12th or beginning of the 13th century it came into the possession of the family of Montefeltro. Of this by far the most important member was Federigo da Montefeltro, lord of Urbino from 1444 to 1482, one of the most successful condottieri chiefs of his time, and not only a man of great military and political ability, but also an enthusiastic patron of art and literature, on which he lavished immense sums of money. Federigo much strengthened his position, first by his own marriage with Battista, one of the powerful Sforza family, and secondly by marrying his daughter to Giovanni della Rovere, the favourite nephew of Pope Sixtus IV., who in return conferred upon Federigo the title of duke. Federigo's only son Guidubaldo, who succeeded his father, married in 1489 the gifted Elizabeth Gonzaga, of the ruling family in Mantua. In 1497 he was expelled from Urbino by Caesar Borgia, son of Alexander VI., but regained his dukedom in 1503, after Caesar's death. Guidubaldo was the last duke of the Montefeltro line; at his death in 1508 he bequeathed his coronet to Francesco Maria della Rovere, nephew of Julius II., and for about a century Urbino was ruled by its second dynasty of the Della Rovere family. In 1626 the last descendant of Francesco, called Francesco Maria II., when old and childless abdicated in favour of Pope Urban VIII., after which time Urbino, with its subject towns of Pesaro, Fano, Fossombrone, Gubbio, Castel Durante, Cagli and about 300 small villages, became part of the papal states until the suppression of the temporal power in 1870.

During the reigns of Federigo and Guidubaldo, Urbino was one of the foremost centres of activity in art and literature in Italy. The palace erected by Federigo has already been mentioned. It was at his court that Piero della Francesca wrote his celebrated work on the science of perspective, Francesco di Giorgio Martini his *Trattato d' architettura* (published by Saluzzo, Turin, 1841), and Giovanni Santi his poetical account of the chief artists of his time. The refined magnificence of Guidubaldo's court is eloquently described by Baldassare Castiglione (*q.v.*) in his *Cortegiano*. When Henry VII. of England conferred the order of the Garter on Guidubaldo, Castiglione was sent to England with a letter of thanks and with the small picture, now in the Louvre, of "St George and the Dragon," painted by Raphael in 1504, as a present to the English king. This painting was among Charles I.'s collection which was sold by order of the Commonwealth in 1649.

Throughout the whole of the 16th century the state of Urbino was one of the chief centres for the production of majolica, especially the towns of Gubbio and Castel Durante. Most of the finest pieces of Urbino ware were made specially for the dukes, who covered their sideboards with the rich storied *piatti di pompa*. Among the distinguished names which have been associated with Urbino are those of the Ferrarese painter and friend of Raphael, Timoteo della Vite, who spent most of his life there, and Bramante, the greatest architect of his age. The Milanese sculptor, Ambrogio, who worked so much for Federigo, married a lady of Urbino, and was the progenitor of the Baroccio family, among whom were many able mathematicians and painters. Federigo Baroccio, Ambrogio's grandson, was a very popular painter, some of whose works still exist in the cathedral and elsewhere in Urbino. This city was also the birthplace of Pope Clement XI., of several cardinals of the Alban family, and of Bernardino Baldi, Fabretti, and other able scholars. An interesting view of Urbino, in the first half of the 16th century, occurs among the pen drawings in the MSS. *Arte del vasajo*, by the potter Piccolpasso, now in the Victoria and Albert Museum.

See also E. Calzini, *Urbino e i suoi monumenti* (1897); G. Lipparini, *Urbino* (Bergamo, 1903).

URBS SALVIA (mod. *Urbisaglia*), an ancient town of Picenum, Italy, about 8 m. S. of the modern Macerata, and 10 m. S. of Ricina. It was the meeting-point of several ancient roads; the road leading south from Ancona through Ricina and Falerio to Asculum was crossed here at right angles by that from Fanum to Tolentinum, Septempeda (S. Severino) and Nuceria Camellaria, while another led north-east from Urbs Salvia to Pausulae and the coast at Potentia (near mod. Porto Recanati). It seems to have been also called Pollentia. The date of its foundation is unknown, but it became a colony in the time of Trajan, and its importance seems to begin from this period. It was utterly destroyed by Alaric, and both Procopius (*B.G.* ii. 16, 17) and Dante (*Paradiso*, xvi. 73) speak of its desolation. The *arx* is occupied by the modern village; below it considerable remains of the city walls and of the buildings within them, alike of brickwork of the imperial period, are preserved —an amphitheatre 328×249 ft., with an arena 190×112 ft., a theatre, baths, tombs, &c. A subterranean aqueduct and a number of inscriptions have been found on the site. Close by is a little chapel with paintings of the early 16th century. The Romanesque abbey church of the Fiastra, about 3 m. to the north, is noticeable. The territory of Urbs Salvia probably extended as far as the old Romanesque church of S. Maria di Rambona, 8 m. to the north-west.

URDŪ, the name of that variety of Hindostani which borrows a great part of its vocabulary from Persia and Arabic, as contrasted with "Hindi," the variety which eschews such words, but borrows from Sanskrit instead. It is spoken by Mussulmans and those Hindus who have come under Mussulman influences, and has a considerable literature. See HINDOSTANI and HINDOSTANI LITERATURE.

UREA, or CARBAMIDE, $CO(NH_2)_2$, the amide of carbonic acid, discovered in 1773 by H. M. v. Rouelle, is found in the urine of mammalia, birds and some reptiles; human urine contains approximately 2–3%, a grown man producing about 30 grammes daily. It is also a constituent of the blood, of milk, and other animal fluids. Its synthesis in 1828 by F. Wöhler (*Pogg. Ann.*, 1828, 12, p. 253) is of theoretical importance, since it was the first organic compound obtained from inorganic materials. Wöhler oxidized potassium ferrocyanide to potassium cyanate by fusing it with lead or manganese dioxide, converted this cyanate into ammonium cyanate by adding ammonium sulphate, and this on evaporation gives urea, thus:—

$$K_4Fe(NC)_6 \rightarrow KCNO \rightarrow NH_4CNO \rightarrow CO(NH_2)_2.$$

It may also be prepared by the action of ammonia on carbonyl chloride, diethyl carbonate, chlorcarbonic ester or urethane; by heating ammonium carbamate in a sealed tube to 130–140° C.; by oxidizing potassium cyanide in acid solution with potassium permanganate (E. Baudrimant, *Jahresb.*, 1880, p. 393); by the action of 50% sulphuric acid on cyanamide: $CN \cdot NH_2 + H_2O = CO(NH_2)_2$; by the action of mercuric oxide on oxamide (A. Williamson): $(CONH_2)_2 + HgO = CO(NH_2)_2 + Hg + CO_2$; by decomposing potassium cyanide with a dilute solution of sodium hypochlorite, followed by adding ammonium sulphate (A. Reychler, *Bull. Soc. Chim.*, 1893 [3], 9, p. 427); and by oxidation of uric acid. It may be obtained from urine by evaporating to dryness on the water bath, taking up the residue in absolute alcohol and evaporating the alcoholic solution to dryness again. The residue is then dissolved in water, decolorized by animal charcoal and saturated at 50° C. with oxalic acid. The urea oxalate is recrystallized and decolorized and finally decomposed by calcium carbonate (J. J. Berzelius, *Pogg. Ann.*, 1830, 18, p. 84). As an alternative method, A. N. E. Millon (*Ann. chim. phys.* [2], 8, p. 235) concentrates the urine and precipitates the urea by nitric acid. The precipitate is dissolved in boiling water, decolorized by potassium permanganate and decomposed by barium carbonate. The solution is then evaporated to dryness and extracted by alcohol.

Urea crystallizes in long needles or prisms which melt at 132° C. and sublime when heated *in vacuo*. It is readily soluble in water and in alcohol, but is insoluble in chloroform and ether. When heated above its melting-point, it yields ammonia, cyanuric acid, biuret and ammelide. On warming with sodium, it yields cyanamide. Dry chlorine gas passed into melted urea decomposes it with formation of cyanuric acid and ammonium chloride, nitrogen and ammonia being simultaneously liberated. Alkaline hypobromites or hypochlorites or nitrous acid decompose urea into carbon dioxide and nitrogen. It is also decomposed by warm aqueous solutions of caustic alkalis, with evolution of ammonia and carbon dioxide. When heated with alcohol in sealed tubes, it yields carbamic esters; with alcohol and carbon bisulphide at 100° C., carbon dioxide is liberated and ammonium sulphocyanide is formed. Acid potassium permanganate oxidizes it to carbon dioxide and nitrogen. It acts as a monacid base.

Urea may be recognized by its crystalline oxalate and nitrate, which are produced on adding oxalic and nitric acids to concentrated solutions of the base; by the white precipitate formed on adding mercuric nitrate to the neutral aqueous solutions of urea; and by the so-called "biuret" reaction. In this reaction urea is heated in a dry tube until it gives off ammonia freely; the residue is dissolved in water, made alkaline with caustic soda, and a drop of copper sulphate solution is added, when a fine violet-red coloration is produced. Several methods are employed for the quantitative estimation of urea. R. Bunsen (*Ann.*, 1848, 65, p. 875) heated urea with an ammoniacal solution of barium chloride to 220° C., and converted the barium carbonate formed into barium sulphate, which is then weighed (see also E. Pflüger and K. Bohland, *Zeit. f. anal. Chem.*, 1886, 25, p. 599; K. A. H. Mörner, *ibid.*, 1891, 30, p. 389). Among the volumetric methods used, the one most commonly employed is that of W. Knop (ibid., 1870, 9, p. 226), in which the urea is decomposed by an alkaline hypobromite and the evolved nitrogen is measured (see A. H. Allen, *Commercial Organic Analysis*). J. v. Liebig (*Ann.*, 1853, 85, p. 289) precipitates dilute solutions of urea with a dilute standard solution of mercuric nitrate, using alkaline carbonate as indicator. In this process phosphates must be absent, and the nitric acid liberated during the reaction should be neutralized as soon as possible. Chlorides also prevent the formation of the precipitate until enough of the mercury solution has been added to convert them into mercuric chloride (see also E. Pflüger, *Zeit. f. anal. Chem.*, 1880, 19, p. 378). E. Riegler (ibid., 1894, 33, p. 49) decomposes urea solutions by means of mercury dissolved in nitric acid, and measures the evolved gas.

Urea chlorides are formed by the action of carbonyl chloride on ammonium chloride (at 400° C.), or on salts of primary amines. They are readily hydrolysed by water, and combine with bases to form alkyl ureas, and with alcohols to form carbamic esters. Substituted urea chlorides are formed by the direct action of chlorine (F. D. Chattaway and D. F. S. Wunsch, *Jour. Chem. Soc.*, 1909, 95, p. 129). Urea chloride, $NH_2 \cdot CO \cdot Cl$ (L. Gattermann, *Ann.*, 1888, 244, p. 30), melts at 50° C. and boils at 61–62° C. In the presence of anhydrous aluminium chloride it reacts with aromatic hydrocarbons to form the amides of aromatic acids. *Nitrourea*, $H_2N \cdot CO \cdot NH \cdot NO_2$, prepared by adding urea nitrate to well-cooled concentrated sulphuric acid (J. Thiele and A. Lachmann, *Ann.*, 1895, 288, p. 281), is a crystalline powder, soluble in water, and which decomposes on heating. It is a strong acid and is stable towards oxidizing agents. Diazomethane converts it into the methyl derivatives of isocyanic acid, and nitramide, NH_2NO_2. *Amidourea*, or semicarbazide, $NH_2{\cdot}CO{\cdot}NH{\cdot}NH_2$, is best prepared from hydrazine sulphate and potassium cyanate (J. Thiele and O. Stange, *Ber.*, 1894, 27, p. 31). It may also be obtained by reducing nitrourea in acid solution with zinc dust. It crystallizes in prisms, which melt at 96° C., and are easily soluble in water. It reduces Fehling's solution in the cold. It reacts with carbonyl compounds, giving *semi-carbazones*, and in consequence is frequently used for characterizing such substances. *Hydroxy-urea*, $NH_2{\cdot}CO{\cdot}NH{\cdot}OH$, is produced from hydroxylamine and cyanic acid (W. F. Dresler and R. Stein, *Ann.*, 1869, 150, p. 242), or from ammonium hypochlorite and potassium cyanate (A. Hantzsch, *Ann.*, 1898, 299, p. 99). It crystallizes in needles, which melt at 128–130° C., and is decomposed on long heating. It is readily soluble in water and reduces warm silver solutions. Hyponitrous acid is formed by passing nitrous fumes into its methyl alcohol solution.

Alkyl ureas are formed by the action of primary or secondary amines on isocyanic acid or its esters: $CONH+NH_2R=R{\cdot}NHCONH_2$; $CONR+NHR_2=NR_2{\cdot}CO{\cdot}NHR$; by the action of carbonyl chloride on amines: $COCl_2+2NHR_2=CO(NR_2)_2+2HCl$; and in the hydrolysis of many ureides. The tetra-alkyl derivatives are liquids, the remainder being solids. Hydrolysis by alkalis decomposes them into carbon dioxide, amines and ammonia. The symmetrically substituted ureas are generally tasteless, while the asymmetrical derivatives are sweet. For example, $\alpha\alpha$-dimethyl urea is sweet, $\alpha\beta$-dimethyl urea is tasteless; *p*-phenetol carbamide or dulcin, $NH_2{\cdot}CO{\cdot}NH{\cdot}C_6H_4{\cdot}OC_2H_5$, is sweet, while the di-*p*-phenetol carbamide, $CO(NH{\cdot}C_6H_4{\cdot}OC_2H_5)_2$, is tasteless.

The derivatives of urea containing acid radicles are known as *ureides*. Those derived from monobasic acids, obtained by the action of acid chlorides or anhydrides on urea, decompose on heating and do not form salts. Those containing more than one acyl group are formed by the action of carbonyl chloride on acid amides:

$$COCl_2+2CH_3CONH_2=CO(NHCOCH_3)_2+2HCl.$$

Acetyl urea, $NH_2{\cdot}CO{\cdot}NH{\cdot}COCH_3$, formed by the action of acetic anhydride on urea, crystallizes in needles which melt at 212° C. and, on heating, strongly decomposes into acetamide and cyanuric acid. *Methyl acetyl urea*, $CH_3NH{\cdot}CO{\cdot}NHCOCH_3$, is formed by the action of potash on a mixture of bromine (1 mol.) and acetamide (2 mols.) (A. W. v. Hofmann, *Ber.*, 1881, 14, p. 2725), or of methylamine on acetylurethane (G. Young, *Jour. Chem. Soc.*, 1898, 73, p. 364). When heated with water it is decomposed into carbon dioxide, ammonia, methylamine and acetic acid. *Bromural* or α-brom-isovaleryl urea, $NH_2{\cdot}CO{\cdot}NH{\cdot}CO{\cdot}CHBr{\cdot}CH(CH_3)_2$, has been introduced as an hypnotic; its action is mild, and interfered with by the presence of pain, cough or delirium.

The ureides of oxy-acids and dibasic acids form closed chain compounds (see ALLANTOIN; ALLOXAN; HYDANTOIN; PURIN). *Parabanic acid* (oxalyl urea), $CO[NH{\cdot}CO]_2$, is formed by oxidizing uric acid; or by condensing oxalic acid and urea in the presence of phosphorus oxychloride. It crystallizes in needles and is readily hydrolysed by alkalis. It behaves as a monobasic acid and forms unstable salts. When heated with urea, it forms oxalyl diureide, $H_2N{\cdot}CO{\cdot}CO{\cdot}NH{\cdot}CO{\cdot}NH{\cdot}CO{\cdot}NH_2$. *Dimethylparabanic acid* (cholesterophane), $CO[NCH_3{\cdot}CO]_2$, is formed by oxidizing caffeine or by methylating parabanic acid. It crystallizes in plates, which melt at 145·5° C., and is soluble in cold water. Hydrochloric acid at 200° C. decomposes into oxalic acid, carbon dioxide and methylamine, whilst an alcoholic solution of a caustic alkali gives dimethyl urea and oxalic acid. *Barbituric acid* (malonyl urea), $CH_2[CO{\cdot}NH]CO{\cdot}2H_2O$, formed by condensing malonic acid with urea (E. Grimaux, *Bull. Soc. Chem.*, 1879, 31, 146), crystallizes in prisms, which decompose on heating. It yields a nitroso derivative, is nitrated by nitric acid to dilituric acid and brominated by bromine. It is a dibasic acid. *Veronal* (*q.v.*) is diethyl malonyl urea. For isobarbituric acid see T. B. Johnson and E. V. McCollum, *Jour. Biol. Chem.*, 1906, 1, p. 437. *Tartronyl urea* (dialuric acid), $CO[NH{\cdot}CO]CH{\cdot}OH$, formed by the reduction of alloxan (J. v. Liebig and F. Wöhler, *Ann.*, 1838, 26, p. 276), or of alloxantin (A. Baeyer, *Ann.*, 1863, 127, p. 12), crystallizes in needles or prisms and possesses a very acid reaction. It becomes red on exposure, and in the moist condition absorbs oxygen from the air, giving alloxantin. *Allophanic acid*, $NH_2{\cdot}CO{\cdot}NH{\cdot}CO_2H$, is not known in the free state, as when liberated from its salts, it is decomposed into urea and carbon dioxide. Its esters are formed by passing the vapours of cyanic acid into alcohols (W. Traube, *Ber.*, 1889, 22, p. 1572):

$$CONH\rightarrow NH_2{\cdot}CO_2R\rightarrow NH_2CO{\cdot}NH{\cdot}CO_2R;$$

by the action of chlorcarbonic esters on urea (H. Schiff, *Ann.*, 1896, 291, p. 367); and by the action of urethanes on urea chloride (L. Gattermann, *Ber.*, 1888, 21, p. 293 R). They are readily decomposed by alkalis, yielding cyanuric acid and ammonia. *Biuret* (allophanamide), $NH_2{\cdot}CO{\cdot}NH{\cdot}CO{\cdot}NH_2$, is formed by heating urea; by the action of ammonia on allophanic ester; and by heating urea to 140° C. and passing chlorine into the melt at 140–150° C. (J. Thiele, *Ann.*, 1898, 303, p. 95 Anm.). It crystallizes in needles which melt at 190° C. (with decomposition), and is readily soluble in hot water. When heated strongly it is decomposed into ammonia and cyanuric acid. Baryta water hydrolyses it to carbon dioxide, ammonia and urea. With silver nitrate and caustic soda it yields a silver salt, $Ag_2C_2H_3N_3O_2$. With nitric acid in the presence of sulphuric acid it yields a nitro derivative.

Thiourea, or sulphocarbamide, $CS(NH_2)_2$, is formed by prolonged fusion of ammonium thiocyanate (E. Reynolds, *Ann.*, 1869, 150, p. 224), by passing sulphuretted hydrogen into an ethereal solution of cyanamide (E. Baumann, *Ber.*, 1873, 6, p. 1375), or by heating isopersulpho-cyanic acid (F. D. Chattaway, *Jour. Chem. Soc.*, 1897, 71, p. 612). It crystallizes in thick prisms which melt at 180° C. and is readily soluble in water. When heated for some time with water to 140° C. in a sealed tube, it is transformed into ammonium thiocyanate, a similar result being obtained by heating the base alone for some hours to 160–170° C. On heating alone for some hours to 170–180° C. it is converted into guanidine thiocyanate. It is hydrolysed by alkalis, giving carbon dioxide, ammonia and sulphuretted hydrogen. It is readily desulphurized by silver oxide, mercuric oxide or lead oxide. Potassium permanganate oxidizes it to urea (R. Maly, *Monats.*, 1890, 11, p. 278). It acts as a weak base and forms salts with one equivalent of an acid.

The alkyl derivatives of thiourea are obtained by the action of ammonia and of primary and secondary amines on the mustard oils (A. W. Hofmann, *Ber.*, 1867, 1, p. 27):

$CSNR+NH_3=NH_2{\cdot}CS{\cdot}NHR$; $CSNR+NH_2R=R{\cdot}NH{\cdot}CS{\cdot}NHR$, or by heating the amide salts of the alkyl dithio-carbaminic acids, viz., $NR{\cdot}CS{\cdot}S(NH_3R)$. The monoalkyl derivatives are desulphurized by lead hydroxide in the presence of sodium carbonate, the $\alpha\beta$ dialkyl and trialkyl derivatives being unaffected (A. E. Dixon, *Jour. Chem. Soc.*, 1893, 63, p. 325). The dialkyl thioureas when digested with mercuric oxide and amines give guanidines. $CS(NHR)_2+NH_2R+HgO\rightarrow HgS+RN{:}C(NHR)_2$.

Thiourea and many of its unsymmetrical derivatives have marked physiological action; thiourea causes a slowing of the pulse and respiration, cardiac failure, and death in convulsions; phenyl-, ethyl- and acetyl-thiourea are actively toxic. The most important derivative pharmacologically is allyl-thiourea, also known as thiosinamine or rhodallin, $NH_2{\cdot}CS{\cdot}NH{\cdot}CH_2{\cdot}CH{:}CH_2$.

Thiosemicarbazide, $NH_2{\cdot}CS{\cdot}NH{\cdot}NH_2$, prepared from hydrazine sulphate, potassium carbonate and thiocyanate (N. Freund, *Ber.*, 1895, 28, p. 946; 1896, 29, p. 2501), crystallizes in long needles, which melt at 181–183° C. The addition of sodium nitrite to an aqueous solution of its hydrochloride converts it into amido-triazsulphol . The hydrochloride with potassium cyanate gives hydrazothio-carbonamide, $NH_2{\cdot}CO{\cdot}NH{\cdot}NH{\cdot}CS{\cdot}NH_2$.

Medicine.—Urea has been given in medicine in doses of 10 to 60 grs. either in mixture or hypodermically. It has been used with success as an antiperiodic and antipyretic in ague, and also as a diuretic in gout and kidney affections. Thiosinamine is given internally in doses of ½ to 1 gr. in capsule. Larger doses usually upset the digestion. It has been used for the cure of lupus and of keloid, in which case it is administered hypodermically. In keloid 20 minims of a 10% solution is injected directly into the part. It causes a local reaction with absorption of the scar tissue. For this reason it is used to remove corneal opacities, deafness due to thickening of the membrane, stricture of the oesophagus and hypertrophy of the pylorus, it has also been successful in the treatment of adhesive parametritis. Fibrolysin is a modified form of thiosinamine made by mixing it with sodium salicylate. Fibrolysin is freely soluble and may be given in hypodermic or intra-muscular injection. Like thiosinamine it has a specific action on scar tissue and has been used in urethral strictures. Both these preparations should only be used in cases where it is possible to exclude any tuberculous foci, or by their action in breaking down protective fibrous tissues they may cause a quiescent lesion to become active. In large doses toxic symptoms are produced, death following on coma.

URETHANE, $NH_2CO_2C_2H_5$, the ethyl ester of carbamic acid, is synthesized from ammonia and chlorcarbonic ester or diethyl carbonate; by prolonged boiling of urea with alcohol (A. W. Hofmann, *Ber.*, 1871, 4, p. 268); by the action of alcoholic hydrochloric acid on cyanogen; by the action of alcohol on urea chloride (L. Gattermann, *Ann.*, 1888, 244, p. 40); and by warming alcoholic hydrochloric acid with an alcoholic solution of potassium cyanate (O. Folin, *Amer. Chem. Jour.*, 1897, 19, p. 341). It crystallizes in large plates, readily soluble in water and melting at 49–50° C. When heated with ammonia to 180° C., it gives urea. Cold alcoholic potash decomposes it into potassium cyanate and alcohol.

Nitroso-urethane, $NO{\cdot}NH{\cdot}CO_2C_2H_5$, formed by reducing ammonium nitro-urethane with zinc dust and glacial acetic acid (J. Thiele, *Ann.*, 1895, 288, p. 304), crystallizes in needles which melt at 51–52° C. (with decomposition). It is decomposed by alkalis and by acids:

$$C_3H_6N_2O_3 = CO_2 + C_2H_5OH + N_2 \quad \text{(alkalis)},$$
$$2C_3H_6N_2O_3 = 2CO_2 + C_2H_5OH + 2N_2 + H_2O + C_2H_4 \quad \text{(acids)}.$$

On oxidation it yields nitro-urethane. With a methyl alcoholic solution of potash it yields a yellow precipitate, which is probably the potassium salt of nitrosocarbamic acid, $NK\cdot NO\cdot CO_2K$. *Nitro-urethane*, $NO_2\cdot NH\cdot CO_2C_2H_5$, formed by dissolving urethane in concentrated sulphuric acid and adding ethyl nitrate to the well-cooled mixture (J. Thiele, ibid.), crystallizes in plates which melt at 64° C. and is soluble in water. It has a strongly acid reaction, its salts, however, being neutral. Its silver salt with methyl iodide gives a methyl ether, which is readily split by ammonia into methyl nitramine and methyl urethane (cf. A. P. Franchimont, *Rec. trav. chim.*, 1894, 13, p. 309). On reduction with zinc dust and acetic acid it yields hydrazine carboxylic ester. *Phenyl urethena*, $C_6H_5NH\cdot CO_2C_2H_5$, is formed by the action of cyanformic ester on aniline at 100° C.; by the action of absolute alcohol on benzoyl azoimide (T. Curtius, *Jour. prak. Chem.* [2], 52, p. 214); and by the action of bromine and sodium ethylate on benzamide (E. Jeffreys, *Amer. Chem. Jour.*, 1899, 22, p. 41). It crystallizes in long needles which melt at 51–52° C. and boil at 227–228° C. (with partial decomposition). It is easily soluble in alcohol and when heated in a sealed tube yields aniline and urea. With phosphorus pentasulphide it yields phenyl mustard oil.

Physiologically urethane has a rapid hypnotic action, producing a calm sleep and having no depressant effect on the circulation. It is much used as an anaesthetic for animals. Di-urethane, $NH(CO_2C_2H_5)_2$, and hedonal, $NH_2CO_2CH(CH_3)\cdot(C_3H_7)$, are also narcotics, the latter being, in addition, a powerful diuretic. Phenyl urethane or euphorin has a physiological action more like that of acetanilide and phenacetin than of urethane. It depresses the temperature and is an analgesic. It is of little value as an hypnotic.

URFÉ, HONORÉ D', MARQUIS DE VALBROMEY, COMTE DE CHÂTEAUNEUF (1568–1625), French novelist and miscellaneous writer, was born at Marseilles on the 11th of February 1568, and was educated at the Collège de Tsarnon. A partisan of the League, he was taken prisoner in 1595, and, though soon set at liberty, he was again captured and imprisoned. During his imprisonment he read Ronsard, Petrarch and above all the *Diana enamorada* of George de Montemayor and Tasso's *Aminta*. Here, too, he wrote the *Epîtres morales* (1598). Honoré's brother Anne, comte D'Urfé, had married in 1571 the beautiful Diane de Châteaumorand, but the marriage was annulled in 1598 by Clement VIII. Anne D'Urfé was ordained to the priesthood in 1603, and died in 1621 dean of Montbrison. Diane had a great fortune, and to avoid the alienation of the money from the D'Urfé family, Honoré married her in 1600. This marriage also proved unhappy; D'Urfé spent most of his time separated from his wife at the court of Savoy, where he held the charge of chamberlain. The separation of goods arranged later on may have been simply due to money embarrassments. It was in Savoy that he conceived the plan of his novel *Astrée*, the scene of which is laid on the banks of the Lignon in his native province of Forez. It is a leisurely romance in which the loves of Céladon and Astrée are told at immense length with many digressions. The recently discovered circumstances of the marriages of the brothers have disposed of the idea that the romance is autobiographical in its main idea, but some of the episodes are said to be but slightly veiled accounts of the adventures of Henry IV. The shepherds and shepherdesses of the story are of the conventional type usual to the pastoral, and they discourse of love with a casuistry and elaborate delicacy that are by no means rustic. The two first parts of *Astrée* appeared in 1610, the third in 1619, and in 1627 the fourth part was edited and a fifth added by D'Urfé's secretary Balthazar Baro. *Astrée* set the fashion temporarily in the drama as in romance, and no tragedy was complete without wire-drawn discussions on love in the manner of Céladon and Astrée. D'Urfé also wrote two poems, *La Sireine* (1611) and *Sylvanire* (1625). He died from injuries received by a fall from his horse at Villafranca on the 1st of June 1625 during a campaign against the Spaniards. The best edition of *Astrée* is that of 1647. In 1908 a bust of D'Urfé was erected at Virien (Ain), where the greater part of *Astrée* was written.

URGA (the Russian form of the Mongol Orgo = palace of a high official), a city of Mongolia, and the administrative centre of the northern and eastern Kalka tribes, in 48° 20′ N., 107° 30′ E., on a tributary of the Tola river. It is the holy city of the Mongols and the residence of the "Living Buddha," metropolitan of the Kalka tribes, who ranks third in degree of veneration among the dignitaries of the Lamaist Church. This "resplendently divine lama" resides in a sacred quarter on the western side of the town, and acts as the spiritual colleague of the Chinese amban, who controls all temporal matters, and who is specially charged with the control of the frontier town of Kiakhta and the trade conducted there with the Russians.

Hurae, as the Mongols call Urga (Chinese name, K'ulun), stands on the high road from Peking to Kiakhta (Kiachta), about 700 m. N.W. of Peking and 165 m. S. of Kiakhta. There are three distinct quarters: the *Kuren* or monastery, the residence of the "Living Buddha"; the Mongol city proper (in which live some 13,000 monks); and the Chinese town, two or three miles from the Mongol quarter. Besides the monks the inhabitants number about 25,000. The Chinese town is the great trading quarter. The houses in this part are more substantially built than in the Mongol town, and the streets have a well-to-do appearance. The law which prohibits Chinamen from bringing their wives and families into the place tends to check increase. There is considerable trade between the Russians, Mongols and Chinese, chiefly in cattle, camels, horses, sheep, piece-goods and milk. Until the second half of the 19th century bricks of tea formed the only circulating medium for the retail trade at Urga, but Chinese brass cash then began to pass current in the markets. The trade of Urga is valued at over £1,000,000 a year.

The temples in the Mongol quarter are numerous and imposing, and in one is a gilt image of Maitreya Bodhisattva, 33 ft. in height and weighing 125 tons. When in 1904, on the occasion of the British expedition to Tibet, the Dalai Lama withdrew from Lhassa he went to Urga, where he remained until 1908. During his residence there the Dalai Lama would have no communication with the Urga Lama—described as a drunken profligate (see *The Chinese Empire*, ed. M. Broomhall, London, 1907, p. 357). The Chinese contemplate building a railway from Peking to Urga. The first section, to Kalgan, was completed in 1909 (see CHINA, § *Communications*).

URI, one of the cantons of central Switzerland, and one of the earliest members of the confederation. The name is probably connected with the same obscure root as Reuss and Ursern, and is popularly derived from Urochs or Auerochs (wild bull), a bull's head having been borne for ages as the arms of the region. The total area of the canton is 415·3 sq. m., of which 184·3 are reckoned as "productive" (forests covering 43·9 sq. m.), while of the rest 44·3 are occupied by glaciers and 7½ sq. m. by the cantonal share of the Lake of Lucerne. The highest summit in the canton is the Dammastock (11,920 ft.). The canton is composed of the upper valley of the Reuss, a mountain torrent that has cut for itself a deep bed, save in case of the basin of Ursern, near its upper end, and the plain of Altdorf, just before it forms the Lake of Lucerne. Hence, save in these two cases, the canton is made up of a wild Alpine valley, very picturesque in point of scenery, but not offering much chance of cultivation. Through nearly the whole of this savage glen runs the main line of the St Gotthard railway (opened in 1882), the part (28½ m.) in the canton being that between Sisikon, on the Lake of Lucerne, and Göschenen, at the northern mouth of the great tunnel (9¼ m.) through the Alps, and at the lower end of the wild Schöllenen gorge that cuts it off from the basin of Ursern. The most remarkable engineering feats are near Wassen. There is also an electric tramway from Altdorf to its port, Flüelen. On the other hand, several magnificent carriage roads are within the borders of the canton, leading to or over the mountain passes that give access either to Glarus (the Klausen Pass, 6404 ft.), or to Ticino (St Gotthard Pass, 6936 ft.), or to the Grisons (Oberalp Pass, 6719 ft.), or to the Valais (Furka Pass, 7992 ft.). Owing to the physical conformation of the canton, it was difficult for it to extend its rule save towards the south (see below), but since very early days it has held the splendid pastures of the Urnerboden, on the other slope of the Klausen Pass, as well as the Blacken Alp, at the head of the Engelberg valley, though the northernmost slope of the St Gotthard Pass still belongs to Ticino. In 1900 the population of the canton was only 19,700, of whom 18,685 were German-speaking, 947 Italian-speaking (this number varied much during the construction of the St Gotthard railway, mainly by Italian navvies), and 24 French-speaking, while 18,924 were Romanists, 773 Protestants, and 1 a Jew. The capital is Altdorf (*q.v.*), indissolubly connected with the legend of William Tell (*q.v.*). The only other important villages are Erstfeld (2416 inhab.), a great railway centre, where the mountain engines are put on, and Silenen (1892 inhab.). The population is all but exclusively pastoral, natural causes limiting much effort in the way of agriculture, save near Altdorf. In the canton there are 102 "alps" or mountain pastures, capable of supporting 10,354 cows, and of an estimated capital value of 5,771,000 fr. Till 1814 Uri formed part of the diocese of Constance (save Ursern, which has always been in that of Coire), while since that date it is administered by the bishop of Coire, though legally in no diocese. The inhabitants are very industrious and saving, though not rich in worldly goods, as their land is so barren. They are extremely conservative, and passionately attached to their religion. Wooden sandals are still commonly worn in the Alpine glens. Of recent years the canton has been much visited by travellers, who have brought much money into it. It forms a single administrative district, which comprises twenty communes. The legislature of the canton is the time-honoured primitive democratic assembly, called the *Landsgemeinde*, composed of all male citizens of 20 years of age, and meeting once annually near Altdorf on the first Sunday in May. It has retained many curious antique ceremonies and customs. It elects the single member of the Federal *Ständerat*, as well as the cantonal executive of seven members (holding office for four years), two of whom are the highest officials, the Landammann and his deputy. There is also a sort of standing committee, called the *Landrat*, which is charged with the administration and minor legislative matters. It is composed of members elected for four years by a popular vote in the proportion of one to every 400 (or fraction over 200) inhabitants, though each commune, even if not attaining this standard of population, is entitled to a member. The single member of the Federal *Nationalrat* is elected by a popular vote. The constitutional details, apart from the *Landsgemeinde*, are settled by the cantonal constitution of 1888 (since revised slightly).

Uri is first mentioned in 732 as the place of banishment of Eto, the abbot of Reichenau, by the duke of Alamannia. In 853 it was given by Louis the German to the nunnery (*Frauenmünster*) at Zürich which he had just founded, and of which his daughter, Hildegard, was the first abbess. Hence the "abbey folk" in Uri enjoyed, as such, the privilege of exemption from all jurisdictions save that of the king's *Vogt* or "steward of the manor" at Zürich, this *Vogtei* being cut off from the country of the Zürichgau. The rule of the abbess was mild, so that the other inhabitants of Uri either became her tenants or obtained similar privileges. Little by little the gathering together of all the inhabitants for the purpose of regulating the customary cultivation of the land created a corporate feeling and led to a sort of local government. On the extinction of the Zäringen dynasty (1218), the *Vogtei* reverted to the king, who gave it to the Habsburgs. But in 1231 King Henry bought Uri from them, and thus it became again immediately dependent on the king, the purchase being perhaps due to the rising importance of the route over the St Gotthard Pass (first distinctly mentioned in 1236). As early as 1243 Uri had a common seal, and in the confirmation of its privileges (1274) granted by Rudolf of Habsburg mention is made of its "head-man" (*Amman*) and of the "commune" (*universitas*). Uri therefore was quite ready to take part, with Schwyz and Unterwalden, in founding the "Everlasting League" (germ of the later Swiss confederation) on the 1st of August 1291, defending its liberty in the fight of Morgarten (1315) and renewing the League of the Three at Brunnen (1315). Later it took part in the victory of Sempach (1386). In 1403, with the help of Obwalden, it won the Val Leventina from the duke of Milan, but it was lost in 1422, though in 1440 Uri alone reconquered it and kept it (winning the bloody fight of Giornico in 1478) till 1798. In 1419, with Obwalden, Uri bought Bellinzona, but lost it at the battle of Arbedo (1422), though, with Schwyz and Nidwalden, it won it back in 1500, keeping it also till 1798. In 1512 Uri shared in the conquest of Lugano, &c., by the Confederates, her natural position forcing her to extend her rule towards the south, though many attempts on and temporary occupations of the Val d'Ossola (1410–1515) ultimately failed. In 1410 a perpetual alliance was made with the valley of Ursern or Val Orsera, the latter being allowed its own head-man and assembly, and courts under those of Uri, with which it was not fully incorporated till 1888. Ursern originally belonged to the great Benedictine monastery of Disentis, at the head of the Vorder Rhine valley, and was most probably colonized in the 13th century by a German-speaking folk from the Upper Valais. At the Reformation Uri clung to the old faith, becoming a member of the "Christliche Vereinigung" (1529) and of the Golden League (1586). In 1798, on the formation of the Helvetic republic, Uri became part of the huge canton of the Waldstätten and lost all its Italian possessions. In September 1799 Suworoff and the Russian army, having crossed the St Gotthard to Altdorf, were forced by the French to pass by the Kinzigkulm Pass into Schwyz, instead of sailing down the lake to Lucerne. In 1803 Uri became an independent canton again, with Ursern, but without the Val Leventina. It tried hard to bring back the old state of things in 1814–15, and opposed all attempts at reform, joining the League of Sarnen in 1832 to maintain the pact of 1815, opposing the proposed revision of the pact, and being one of the members of the Sonderbund in 1845. Despite defeat in the civil war of 1847, Uri voted against the Federal constitution of 1848, and by a crushing majority against that of 1874.

URIC ACID, $C_5H_4N_4O_3$, in organic chemistry, an acid which is one of the penultimate products of the tissue waste in the human body. While the bulk of the nitrogen of the albuminoids passes off through the bladder as urea, a small portion of it stops at the uric acid stage. Human urine contains only a fraction of a per cent. of the acid, chiefly as sodium salt; abundance of uric acid is met with in the excrement of serpents and birds, with whom it is the principal nitrogenous product of tissue waste. For its preparation guano is boiled repeatedly with a solution of borax in 120 parts of water. The filtered solution is acidified with hydrochloric acid, when impure uric acid separates out as a brown precipitate, which is washed with cold water; it is then dissolved in hot dilute caustic potash or soda, the solution filtered, and the filtrate saturated with carbon dioxide. An almost insoluble urate is precipitated, which is filtered, washed and decomposed by hot dilute hydrochloric acid. Uric acid separates as a white precipitate, which is filtered off, washed and dried, to be repurified by a repetition of the alkali process or otherwise. Pure uric acid forms a snow-white micro-crystalline powder, devoid of smell or taste, soluble in 1800 parts of boiling and in 14,000 parts of cold water, but insoluble in alcohol and in ether. For its detection in urine, the urine is mixed with excess of hydrochloric acid, and allowed to stand, when the uric acid separates out, generally coloured reddish by impurities. The precipitate is dissolved in a few drops of nitric acid and the solution cautiously evaporated to dryness. The residue when exposed to ammonia gas assumes the intense purple colour of murexide.

The acid, which was discovered by C. Scheele in 1776 in urinary calculi, was afterwards investigated by Liebig and Wöhler. The determination of its constitution, and its relation to other vegetable and animal products, followed from the researches of A. von Baeyer and E. Fischer (see PURIN).

URICONIUM (more correctly *Viroconium*), a large Romano-British country town, chef-lieu of the Cornovii, now Wroxeter on the Severn, 5. m. E. of Shrewsbury. At first perhaps (A.D. 45–55) a Roman legionary fortress, held by Legio XIV. Gemina against the Welsh hill-tribes, its garrison was soon removed and it became a flourishing town with stately town hall, baths and other appurtenances of a thoroughly civilized and Romanized city. It was larger and probably richer than—for example—Silchester. The lines of its walls can still be traced, enclosing an area of 170 acres, and parts of the town hall and baths have been uncovered. Its originally Celtic name seems to survive in the names of Wroxeter and the neighbouring hill, Wrekin.

See *Victoria History of Shropshire*, i. 215–56. (F. J. H.)

URIM AND THUMMIM, in the Bible. These descriptive terms are applied to one of the methods of divination employed by the ancient Hebrews, which, it is now generally agreed, consisted in a species of sacred lot. Together with "dreams" and the prophetic oracle it formed the recognized channel by which divine communications were given (cf. 1 Sam. xxviii. 6). That some method of casting lots is denoted by the terms is evident from 1 Sam. xiv. 41 f. The Hebrew text in this passage, as emended by the LXX and in this form generally accepted, runs as follows: "And Saul said: 'O Jehovah, God of Israel, why dost Thou not answer Thy servant to-day? If this fault be in me or in Jonathan my son, give Urim, and if it be in Thy people Israel, give Thummim.' And the lot fell upon Saul and Jonathan, and the people escaped. And Saul said: 'Cast (the lot) between me and Jonathan my son, and on whomsoever Jehovah shall cause the lot to fall let him die.' So they cast (the lot) between him and Jonathan his son, and Jonathan was taken."

From this illuminating passage it is clear (*a*) that by means of the Urim and Thummim the guilt or innocence of the suspected parties was determined; (*b*) that this was effected by a series of categorical questions implying the simple alternative of "yes" or "no," or something positive or negative. A further inference (*c*) from a comparison of 1 Sam. xiv. 41 f. with ver. 36 (Greek text) is that this method of casting the sacred lot was closely connected with divination by the ephod (*q.v.*), and was the prerogative of the priests. This last point appears explicitly in the "Blessing of Moses" (Deut. xxxiii.), where the opening words of the Benediction on Levi run thus (text as emended by Ball, following LXX; *P.S.B.A.* 1896, 118 f.):—

"Give to Levi Thy Thummim,
And Thy Urim to the man of Thy favour."

Similar modes of divination were practised, it would seem, among the pre-Islamic Arabs. The following custom is cited by Professor G. F. Moore,[1] on the testimony of Moslem writers, as having been in vogue: "Two arrow shafts (without heads or feathers), on one of which was written 'Command,' on the other 'Prohibition,' or words of similar purport, were placed in a receptacle, and according as one or the other of them was drawn out it was known whether the proposed enterprise was in accordance with the will of the god and destined to succeed or not" (cf. Prov. xvi. 33; Acts i. 26).

Regarding the form and material of the Urim and Thummim no details are given in the Old Testament. They seem to have fallen into desuetude at a comparatively early period. No mention is made of their use in the historical books after the time of David and Solomon, though it is probable that such use is implied in passages where the ephod is mentioned (*e.g.* Hosea iii. 4). In the post-exilic Priestly Code (*i.e.* the bulk of the Levitical legislation of the Pentateuch), however, the Urim and Thummim figure as part of the equipment of the high priest (cf. Ex. xxviii. 30; Lev. viii. 8; Num. xxvii. 21). Here it is stated that they are kept in a square pouch which is worn upon the high priest's breast ("the breastplate of judgment"), and attached to the ephod. Thus the association of the Urim and Thummim with the ephod, which appears in the oldest narratives, is retained in the Priestly Code (P). It is doubtful, however, whether P had any clear notion as to what exactly the Urim and Thummim were. The priestly writer gives no directions as to how they were to be made. They were retained in his ideal legislation, apparently, because their use was already invested with the mystery of a long-vanished past, and they were regarded as having formed one of the most venerable adjuncts of the priesthood. That this method of divination was not in actual use after the Exile is shown by Neh. vii. 65 (Ezra ii. 63; 1 Esdras v. 40) where an important point affecting the priestly families is reserved "till there stood up a priest with Urim and Thummim." Later references (Ecclus. xlv. 10; in Josephus and the Talmud) prove that no real tradition survived on the subject. The identification of them with the jewels of the breastplate and on the shoulders of the high priest (which apparently has the authority of Josephus) is unwarranted; other ancient guesses are equally baseless. Nor has any satisfactory explanation of the names Urim and Thummim been proposed. As vocalized in the Massoretic Hebrew text the names = "Lights and perfection." But the Greek translators read the former *'orim* and connected it with *torah*, "decision"; it would thus = "doctrine"; so Symmachus, cf. 1 Esd. v. 40, where "a high priest wearing Urim and Thummim" (R.V.) is given as "a high priest clothed in doctrine and truth" in A.V. Nor can the attempt of the American scholar Muss-Arnolt to explain them as cognate with the Babylonian Tablets of Destiny be pronounced successful. Perhaps the conjecture least open to objection is that which regards the terms Urim and Thummim as the names of two lots[2] (perhaps actually written on them) of opposite import. In this case the former of the two names might be derived from the root *'arar*, "to curse"; the other from a root meaning "to be without fault." The one would thus signify "that a proposed action was satisfactory to God, the other that it provoked His wrath" (Professor G. F. Moore). But all such explanations are highly precarious.

BIBLIOGRAPHY.—For the older views, see Spencer, *De leg. Hebr. rit.* Diss. VII.; and a useful summary by Plumptre in Smith's *Bib. Dict.* For modern discussions, see the articles "Urim and Thummim" in the Bible dictionaries; the relevant sections in the treatises on archaeology; and W. Muss-Arnolt, *The Urim and Thummim* (reprinted from the *American Journal of Semitic Languages*, July 1900). (G. H. Bo.)

URINARY SYSTEM. The urinary system in the fully developed human being consists of (1) the kidneys, (2) the ureters, (3) the urinary bladder, and (4) the urethra.

As the greater part of the male urethra is a generative as well as a urinary canal, its description will be found in the article on the REPRODUCTIVE SYSTEM.

Kidneys.

The *kidneys* are two bean-shaped granular masses, firm in consistence and reddish brown in colour, about $4\frac{1}{2}$ in. long, and placed obliquely behind the other abdominal viscera—one on each side of the last thoracic and three upper lumbar vertebrae. Each is imperfectly covered on its ventral surface by peritoneum and is moulded to some extent by the viscera which press on it. Around them there is usually a considerable amount of fat and areolar tissue, by which, as well as by the peritoneum and by the presence of the surrounding viscera, the kidneys are retained in their place. In rare cases the kidney may slip from its usual place in the loins to a lower position (movable kidney), and may even be movable

[1] *Encycl. Biblica*, iv. (col. 5236), where further details are given.

[2] The lots may have been small pebbles, or small tablets of wood or bone.

in the abdominal cavity (floating kidney)—a condition often productive of serious consequences. The kidney in the foetus is lobulated, but the intervals between the lobes become smoothed out in later years of childhood. Each gland is invested

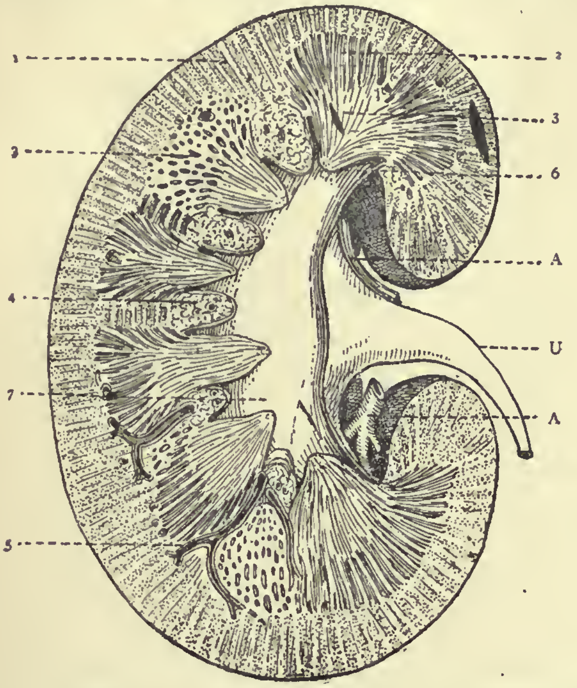

FIG. 1.—Vertical Section through the Kidney. A, branch of renal artery; U, ureter. 1, cortical substance with cortical pyramids, and labyrinth substance of tortuous tubes; 2 and 3, medullary pyramids of straight tubules; 4, fatty masses around blood vessels (5); 6, papilla; 7, pelvis.

FIG. 2.—Diagrammatic Representation of the Structures forming a Kidney Lobe.

In the middle part of the figure the course of one of the kidney tubules is indicated, and in the lateral parts the disposition of the larger arteries. A, cortex; B, intermediate zone; C, papillary portion.

The diagram at the right-hand side of the lower part of the figure illustrates the connexions of the structures composing a Malpighian corpuscle.

by a firm, closely adherent, fibrous capsule, under which is an imperfect lamina of unstriped muscle. The inner and ventral margin of each kidney is concave, and into this *hilum* or concavity the renal artery from the aorta passes. Here also the renal vein escapes and joins the vena cava inferior. The ureter or metanephric duct, always behind and below the blood vessels, emerges here and passes downward to the bladder. When the kidney is longitudinally divided from hilum to outer edge, the cut surface is seen to consist of two parts—an outer layer, the cortex, and an inner part, the medulla (fig. 1). The latter consists of a series of eight to sixteen pyramids, whose bases and sides are invested with cortical matter, and whose apices or papillae project into the hilum, where they are severally surrounded by membranous tubes (calices), which by their union make up the ureter. The part of the ureter situated in the hilum is dilated, and is named the pelvis of the kidney.

In minute structure the kidney is the most complex gland in the body. Each of the papillae consists of a large number of straight tubes—collecting tubules—which open by pores on its surface. When these are traced into the pyramid, they are seen to divide several times, their fine end-branches projecting in little tufts into the cortical matter at the base of each pyramid. Here the branches coming from the tube change in structure and become convoluted in the cortex—the convoluted tubules. Next, each suddenly dips back again as a long straight loop—the loop of Henle—into the pyramid, reaching nearly to the papillary region; then turning sharply on itself, passes back straight to the cortex, where it again becomes convoluted, ultimately ending by dilating into a flask-like bulb called a Malpighian corpuscle. The renal artery, after breaking

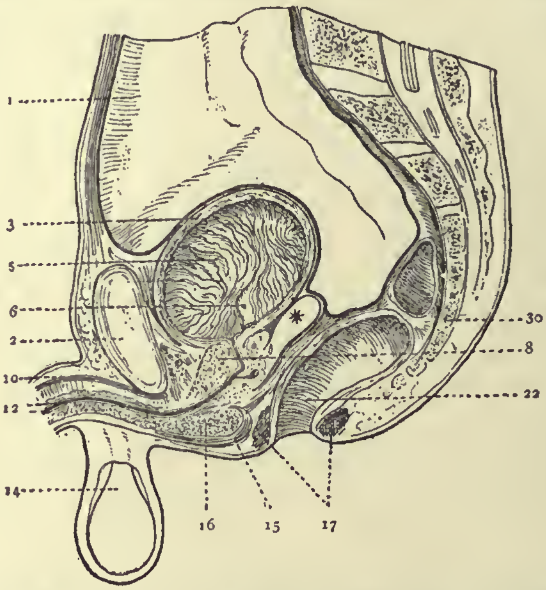

FIG. 3.—Vertical Section through Pelvis, showing urinary bladder and rectum *in situ*. 1, peritoneum; 2, pubic symphysis; 3, muscular coat of bladder; 5, mucous membrane folded and wrinkled; 6, opening of ureter; 8, prostate; 10, vena dorsalis penis; 12, corpus spongiosum; 14, testis in its sac; 15, bulbocavernosus muscle; 16, bulb; 17, sphincters of the anus; 22, anal opening; 30, coccyx; *, vesicula seminalis.

up into branches between the pyramids, ends in minute end-arteries in the cortex. Each of these pierces into one of the flasks just described, and there becomes branched, the branches being collected into a little ball or glomerulus which nearly fills the flask. From this an efferent vessel escapes, which, joining with its neighbouring vessels of the same kind, makes a close network around the convoluted tubes, ultimately ending in the renal vein. It is supposed that the different constituents of the urine are eliminated in different parts of these tubes—some, especially the watery parts, in the flask, and some, especially the more solid constituents, in the convoluted tubular apparatus. A peculiar form of glandular epithelium lines the two convoluted areas of the tubes and the limb of the loop nearer the straight or collecting tubes.

The *ureter* or duct of the kidney begins at the hilum and descends on the back wall of the abdominal cavity to open into the bladder. It is usually about 12 in. in length and as thick as a goose quill. At its termination it passes obliquely through the coats of the bladder, so that when the bladder is distended the lumen of its end is closed.

Bladder and urethra.

The *urinary bladder* is a membranous bag lying in the pelvic cavity directly behind and above the dorsal surface of the pubes. In the foetus and infant, however, the bladder lies in the abdomen, not in the pelvis. During life it is seldom distended so as to hold more than about 10 oz., but when the abdomen is opened it can be dilated to more than double that size. When distended it rises and is applied closely against the back of the ventral abdominal wall. The bladder has a strong muscular investment of unstriped muscle in several layers, which are innervated by branches from the sacral nerves. It has a peculiar epithelial lining of several strata, the superficial cells of which are cubical when the sac is collapsed, but become flattened and scale-like when it is distended. At the lower part of the bladder there is a triangular space known as the trigone, the angles of which are formed by the openings of the two ureters and the urethra. In this space the mucous membrane is smooth and firmly bound to the subjacent muscle; elsewhere it is thrown into numerous folds when the bladder is empty. A muscular band called the torus uretericus

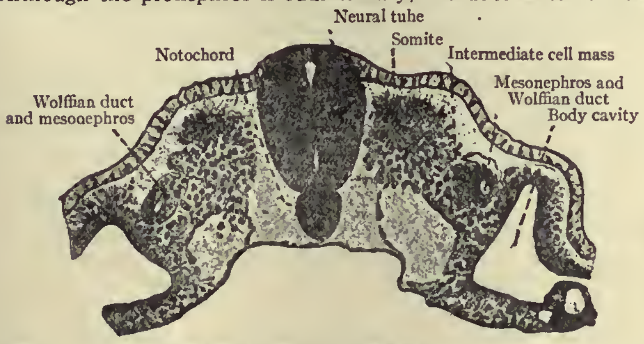
or Mercier's bar joins the orifices of the ureters. The female urethra is only $1\frac{1}{2}$ in. in length and is comparable only with that part of the male urethra which extends from the bladder to the openings of the seminal ducts (fig. 3).

Embryology.

The excretory organs of the embryo are developed as a series of small tubes in the intermediate cell mass (see fig. 5), the ventral part of which projects to form the Wolffian ridge. Three sets of these tubes appear in succession and occupy the whole length of the body from the cervical to the lumbar region. The most anterior—*pronephros* or *head kidney*—is represented in man by only two or three small tubules on each side which appear as ingrowths from the neighbouring coelom (fig. 6, Pro.N.). From the study of comparative anatomy it is probable that these are mere vestiges. Although the pronephros is rudimentary, the duct which in lower



From A. F. Dixon, Cunningham's *Text-Book of Anatomy.*

FIG. 5.—Transverse Section through the Body of a Fowl Embryo.

types carries away its excretion is well developed. This is the *Wolffian duct,* which appears in man before the pronephric tubes are formed, and runs longitudinally back in each intermediate cell mass to open into the cloaca (fig. 6, W.D.). In certain parts of its course it is at an early date in very close relation with the skin on the dorsal side of the intermediate cell mass, and many embryologists hold that it is originally ectodermal in origin, and has sunk into the mesoderm secondarily. Others think that it is primarily mesodermal but has gained secondary connexions with the ectoderm. From a morphological point of view, as will be explained in the comparative anatomy section, the former view seems the more likely.

When the pronephric tubules disappear, which they do at an early stage of the embryo's development, the Wolffian duct persists and acts as the drain for another and much more important series of tubules, which are formed in the intermediate cell mass behind the region of the pronephros, and make up the *mesonephros* or *middle kidney* (fig. 6, M.N.). There is some doubt as to whether these tubes are strictly homologous and in series with those of the pronephros; but they are certainly of later development.

By about the sixth week of intra-uterine life these tubules reach their maximum development and form the *Wolffian body,* which projects into the coelom as the now very definite *Wolffian ridge* and acts as the functional excretory organ of the embryo (see fig. 7). When the permanent kidney is formed this organ degenerates and its ultimate fate is discussed in the article on the REPRODUCTIVE SYSTEM.

The *metanephros* or *hind kidney* begins as a diverticulum from the dorsal side of the Wolffian duct close to its opening into the

cloaca (see fig. 6, Mt.N.); this occurs about the fourth week of intra-uterine life, and the diverticulum grows forward (cephalad), dorsal to the hind end of the Wolffian body. In doing this it forms a duct—the *metanephric duct* or *ureter*—the cephalic end of which enlarges and divides to form the calices of the kidney. From the calices numerous smaller ducts grow into the mesoderm of the hind (caudal) end of the intermediate cell mass and become the collecting

tubes of the kidney. While this is going on another set of tubules, probably in series with the mesonephric tubules, develop independently in the intermediate cell mass and so form all the rest of the tubular system of the kidney. Toward these tubules, at one point, branches from the aorta push their way and invaginate each tube, thus forming the Malpighian corpuscles.

By the eighth week the kidney is definitely formed and takes over the excretory work of the mesonephros, which now atrophies; its surface is distinctly lobulated, a condition which persists until after birth.

At first, as has been stated, the ureters open into the Wolffian ducts, but later on each gains a separate opening into the cloaca, and eventually these shift in a ventral direction until they reach their permanent connexion with the allantoic bladder.

The *bladder* is developed from that part of the cloaca from which the allantois has grown out, and also from that part of the allantois which is nearest the cloaca. At first it is a tubular structure, but after the second month becomes more pyriform, the stalk of the pear corresponding to the fibrous *urachus* which reaches the umbilicus. Most of that part of the tubular allantois which lies between the permanent openings of the ureters and the Wolffian ducts becomes the *urinary sinus* and does not dilate in the same way that the permanent bladder does. This, in the female, forms the whole of the urethra, and in the male the upper part of the prostatic urethra. Behind (caudad) the urinary sinus is the urogenital sinus, which is treated of in the article on the REPRODUCTIVE SYSTEM.

The *Müllerian ducts* (fig. 6, M.D.) are formed after the Wolffian ducts are fully developed. A ridge appears in the intermediate cell mass ventral to the Wolffian duct, and into the anterior (cephalic) end of this a tubular process of the coelom forces its way backward (caudad). Before reaching the cloaca the two Müllerian ducts coalesce and open between the orifices of the two Wolffian ducts. These ducts, as is shown in the article on the REPRODUCTIVE SYSTEM, form the oviducts, uterus and at least part of the vagina.

For further details and literature see Quain's *Anatomy*, vol. i. (Longmans, Green & Co., London, 1908); J. M'Murrich, *The Development of the Human Body* (Rebman, London, 1906), and A. Keith, *Human Embryology and Morphology* (Arnold, London).

Comparative Anatomy.

In the Acrania (Amphioxus) the nephridial tubules are segmentally arranged and are only found in the pharyngeal region; each opens into the coelom by several ciliated funnels called nephrostomes, and also into the atrium, which is practically the exterior of the animal, by an opening called the nephridiopore. There is reason to believe that we have here a pronephros of a very primitive type and arranged on the same plan, in many respects, as the simple nephridia of such lowly forms as the earthworm. There is nothing to indicate that a mesonephros is present, nor are there any Malpighian corpuscles or longitudinal ducts.

Among the Cyclostomata (lampreys and hags) the pronephros persists throughout life in Bdellostoma and probably in the hag (Myxine), but a Wolffian (archinephric) duct has been evolved so that the tubules no longer open on the surface by nephridiopores. It has been surmised that in a transitional type the tubules opened into a groove on each side of the surface of the animal and that the edges of this, coming together, formed a duct. At any rate the superficial openings of the primitive nephridia make it probable that the Wolffian duct was originally of ectodermal origin. A mesonephros has now appeared behind (caudad) the pronephros, though it is not certain whether its tubules (mesonephridia) are in series with those of the pronephros or whether they are structures on a more dorsal plane; but they certainly open into the Wolffian duct, which also drains the pronephros, and so this duct is functionally simply a ureter and has nothing to do with the sexual glands. No Müllerian duct has yet been evolved.

In the Teleostomi (bony and ganoid fish) the pronephros is usually aborted in the adult and the mesonephros is the functional kidney. As the genital glands have special coelomic relations the Wolffian duct is still merely a ureter, and in the Teleostei at least there is no true Müllerian duct.

In the Elasmobranchii (sharks and rays) the pronephros is more completely and more early aborted than in the last subclass, and the mesonephros is divided into an anterior or genital part, which receives the vasa efferentia in the male from the testis and thus is the first appearance phylogenetically of an epididymis and a posterior or renal part. The Wolffian duct therefore acts both as a vas deferens for the sperm and a ureter for the urine, though in the female it is merely a ureter. In the hindmost part of the mesonephros there are separate ducts which are called ureters and open into the lower part of the Wolffian duct in the same way that the metanephric ducts of the Amniota do; it is, however, very doubtful whether they are really homologous with these ducts. The Müllerian duct (see REPRODUCTIVE SYSTEM) is present in elasmobranchs and according to modern views arises as a backgrowth from the coelom as in the Amniota.

The Dipnoi or mudfish are remarkable for having a cloacal caecum which probably functions as an urinary bladder. It is situated on the dorsal wall of the cloaca and is not homologous with the allantoic bladder of higher forms. A good deal of the kidney (mesonephros) as it appears to the naked eye is composed of lymphoid tissue.

In the Amphibia the snake-like forms (Gymnophiona) show a very primitive arrangement of the kidney tubules, each having its nephrostome, Malpighian capsule and short convoluted part leading to the Wolffian duct which acts both as ureter and vas deferens.

In the adult Anura (frogs and toads) the nephrostomes lose their connexion with the nephridia and communicate with the renal veins. In the amphibians a true allantoic bladder first appears as a diverticulum from the ventral wall of the cloaca; in different forms it may be single, bilobed or even double.

In Reptilia the hind kidney or metanephros is developed and takes over all the excretory work; it is usually lobulated, its nephridia are never provided with nephrostomes and its duct (the ureter) opens into the Wolffian duct or vas deferens before reaching the cloaca. The allantoic bladder is present in the Lacertilia (lizards) and Chelonia (turtles), but is absent in others. Birds resemble reptiles very closely in their urinary system except that there is never any bladder and that the ureters and vasa deferentia open independently into the cloaca.

In the Mammalia the bean shape of the kidney is fairly characteristic. In foetal life the organ is always lobulated, and this sometimes persists throughout adult life as in the ox, bear, seal and whale. More often the lobulation disappears on the surface and is only imperfectly represented, on making a section, by the pyramids; even these in some cases fuse so closely that their apices appear as a single papilla. This is the case in many monkeys, carnivores and rodents.

In the Monotremata (Ornithorhynchus and Echidna) there is an allantoic bladder, but the ureters open into the cloaca as they do in birds. In all other mammals they have reached the bladder and open into it by valvular orifices.

On comparing the embryology (ontogeny) of the urinary system with its comparative anatomy (phylogeny) the harmony of the two from a broad point of view is very striking.

For further details see Parker and Haswell, *Text-Book of Zoology* (Macmillan, London, 1897); Wiedersheim's *Comparative Anat. of Vertebrates*, translated by W. N. Parker (London, 1907); Gegenbaur, *Vergleich. Anat. der Wirbeltiere* (Leipzig, 1901).

URMIA (the name as written by the Persians is *Urūmieh* and *Urmieh*; the inhabitants of the place say *Urmi*), a town in the province of Azerbaijan in Persia, situated at an elevation of 4400 ft., in an extremely fertile and highly cultivated plain, 78 m. S.W. of Tabriz (120 by road), 11 to 12 m. from the western shore of the lake of the same name, in 37° 34′ N. and 45° 4′ E. It is surrounded by a wall and deep dry ditch that can be flooded, and is encircled by orchards and gardens which extend all round for miles and even penetrate the heart of the town. The streets are broader than is usual in Persian cities, and most of them have a stream of water running down the middle. There are a busy bazaar and some old mosques. The population is about 35,000, and there are post and telegraph offices. The only building of importance is the ark, or citadel, a walled building in the centre of the town containing an arsenal and barracks for a small garrison. Urmia has for many years been the headquarters of various missions to the Nestorians of the neighbourhood: an American mission (since 1835) representing the "Board of the Foreign Missions of the Presbyterian church of the United States of America"; the French Lazarists (since 1840); British, "The Anglican Mission" founded by Archbishop Benson (1884), and a Russian mission (Orthodox, since 1902). Urmia is the capital of a fertile district 50 m. long and about 20 m. broad, having the same name and containing more than 300 flourishing villages. It exports great quantities of dried fruit and excellent *tutun*, tobacco for chibuks, or Turkish pipes.

URMIA, LAKE OF (also spelt URUMIAH), a lake in north-western Persia, between 37° 10′ and 38° 20′ N. and between 45° 10′ and 46° E., which takes its name (Pers. *Deryacheh i Urmia*, Turk. *Urmi göl*) from the town of Urmia, situated near its western shore, but is also known as the Deryacheh i Shahi and Shahi göl. The limits of the lake vary much, the length, N.–S., from 80 to 90 m., the width, E.–W., from 30 to 45, being greater in the season of high water—in spring when the snows melt—and considerably less in the season of low water. A rise of the level by only a few inches extends the shore of the lake for miles inland, and it may be estimated that the surface covered by the lake during high water is half as much again as that during low water. The Shahi peninsula, which juts out into the lake from the eastern bank, is an island during the season of high water and also sometimes after heavy autumnal rains, separated from the mainland by several miles of shallow water. The mean depth of the lake is 15 to 16 ft., and its greatest depth probably does not exceed 50 ft. The lake has in recent years exhibited extraordinary changes of level, and it is not certain whether some occasional extraordinary rises of level were due to a movement of the earth's crust or merely to an increase of rainfall as compared with evaporation. Günther calculated that the lake covered 1795 sq. m., but he did not state whether during high or low water. De Morgan gives 4000 and 6000 sq. kilometres (1544 and 2317 sq. m.) for low and high water respectively. In the southern half of the lake is a cluster of about fifty rocky islands composed of Miocene strata with marine shells, echinoderms and corals, much resembling the beds of the Vienna basin. The largest of these islands, Koyun daghi, *i.e.* "Sheep-mountain," is 3 to 4 m. long and has a spring of sweet water near which a few people settle occasionally for looking after herds of goats and sheep taken there for grazing. All the islands are uninhabited and some are mere bare rocks of little extent. Although fed by many rivers and streams of sweet water the lake is very saline and its water is about three-fifths as salt as the water of the Dead Sea—far too salt to permit the existence of fish life. The specific gravity of the water is 1·155 during low water and 1·113 during high water. The principal salts contained in solution are sodium chloride, bromide and iodide and sulphates of magnesia, soda and iron. The only organisms living in the lake are a species of artemia, a crustacean known from other brine lakes in Europe and North America, the larva of a species of dipterous insect, probably allied to ephydra, and green vegetable masses composed of bacterial zoogloeae covered with a species of diatom. The rivers which flow into the lake drain an area of nearly 20,000 sq. m.; chub and roach are found in all of them, silurus in some. The lake is navigated by a few round-bottomed boats with round bows and flat sterns, each of about 20 tons burden and carrying an enormous square sail.

Strabo (xi. c. 13, 2) mentions the lake with the name Spauta, a clerical error for Kapauta, from Pers. *Kapaut*, New Pers. *Kebud*, meaning "blue." Old Armenian writers have Kapoit-dzov, "the blue sea." In the *Zendavesta* and *Bundahish* it is called "Chaechasta," and Firdousi in his *Shahnamah* (11th century) has "Chichast."

See J. de Morgan, *Mission scientifique en Perse* (1894); R. T. Günther, "Lake Urmi and its Neighbourhood," *Geogr. Journ.* (November 1899). (A. H.-S.)

URN (Lat. *urna*, either from root of *urere*, to burn, being made of burnt clay, or connected with *urceus*, Gr. *ὕρχα*, jar), a vessel or vase, particularly one with an oviform body and a foot. The Roman term *urna* was used primarily of a jar for carrying or drawing water, but was also specifically applied to the vessel in which the voting-tablets (*tabellae*) and lots (*sortes*) were cast, whence its figurative use for the urn of fate from which are drawn the varying lots of man's destiny. The ashes of the cremated dead were deposited in cinerary urns, a custom perpetuated by the marble or other urns placed upon funeral monuments. The Roman *urna* was also a liquid measure containing half an *amphora*, or about 3½ gallons. Modern usage has given the name to large silver or copper vessels containing tea or coffee with a tap for drawing off the liquids and heated either by a spirit lamp or, as in the older forms, by the insertion of a hot iron in a special receptacle placed in the body of the vessel.

UROTROPIN (hexamethylenetetramine), known also in the United States under the name *Uritone*, a medicinal preparation due to the action of ammonia on formaldehyde. It consists of colourless granular crystals freely soluble in water and having an alkaline reaction. Urotropin is among the most powerful of urinary antiseptics. It was formerly thought that its action was due to the setting free of formaldehyde in the urine, but it is now known by the researches of P. Cammidge that this is not so. It is used to render the urine acid in cases where it is alkaline, loaded with phosphates or purulent, and is thus useful in cases of cystitis. It is slightly diuretic. Experimentally it has been shown to have a solvent action on uric acid, but its action in this direction in the body requires confirmation. Urotropin is very valuable in sterilizing the urine of patients who have suffered from typhoid fever and thus preventing the spread of the disease by what are known as "typhoid carriers." Analogous preparations are cystamine, helmitol and hetralin. Chinotropin is urotropin quinate, and borovertin is urotropin triborate.

URQUHART, DAVID (1805–1877), British diplomatist and publicist, born at Braelangwell, Cromarty. He came of a good Scottish family and was educated in France, Switzerland and Spain, and then at St John's College, Oxford. In 1827 he went under Lord Cochrane (Dundonald) to fight for the Greeks in the War of Independence; he was present at the action of the 28th of September when Captain Hastings destroyed the Turkish squadron in the Bay of Salona, and as lieutenant of the frigate "Hellas" he was severely wounded in the attack on Scio. In November 1828 he left the Greek service. In 1830 he privately examined the new Greek frontier as determined by the protocol of March 22, 1829, and the value of his reports to the government led to his being named British commissioner to accompany Prince Leopold of Coburg to Greece, but the appointment fell to the ground with that prince's refusal of the Greek throne. His knowledge of the local conditions, however, led to his being appointed in November 1831 attaché to Sir Stratford Canning (Lord Stratford de Redcliffe, *q.v.*), ambassador extraordinary to the sultan, for the purpose of finally deliminating the frontiers of Turkey and Greece. On his return to England he published in 1833 *Turkey and its Resources*, a violent denunciation of Russia. In 1833 he was sent on a secret mission to Turkey to inquire into possible openings for British trade, and at Constantinople he gained the complete confidence of the Turkish government. The situation, however, was a delicate one, and Urquhart's outspoken advocacy of British intervention on behalf of the sultan against Mehemet Ali, the policy of Stratford Canning, made him a danger to international peace; he was consequently recalled by Palmerston. At this time appeared his pamphlet *England, France, Russia and Turkey*, the violent anti-Russian character of which brought him into conflict with Richard Cobden. In 1835 he was appointed secretary of embassy at Constantinople, but an unfortunate attempt to counteract Russian aggressive designs in Circassia, which threatened to lead to an international crisis, again led to his recall in 1837. In 1835, before leaving for the East, he founded a periodical called the *Portfolio*, and in the first issue printed a series of Russian state papers, which made a profound impression. From 1847 to 1852 he sat in parliament as member for Stafford, and carried on a vigorous crusade against Lord Palmerston's foreign policy. The action of England in the Crimean War provoked indignant protests from Urquhart, who contended that Turkey was in a position to fight her own battles without the assistance of other Powers. To attack the government, he organized "foreign affairs committees" which became known as "Urquhartite," throughout the country, and in 1855 founded the *Free Press* (in 1866 renamed the *Diplomatic Review*), which numbered among its contributors the socialist Karl Marx. In 1860 he published his book on *The Lebanon*. From 1864 until his death Urquhart's health compelled him to live on the continent, where he devoted his energies to promoting the study of international law. He died on the 16th of May 1877. His wife (Harriet Chichester Fortescue), by whom he had two sons and two daughters, and who died in 1889, wrote numerous articles in the *Diplomatic Review* over the signature of "Caritas."

To Urquhart is due the introduction into Great Britain of hot-air Turkish baths. He advocated their use in his book called *Pillars of Hercules* (1850), which attracted the attention of the Irish physician Dr Richard Baxter (1802–1870), and the latter introduced them in his system of hydropathy at Blarney, Co. Cork. The Turkish baths in Jermyn Street, London, were built under Urquhart's direction.

URQUHART, or URCHARD, **SIR THOMAS** (1611–1660), Scottish author and translator of Rabelais, was the son of Sir Thomas Urquhart of Cromarty, the representative of a very ancient family, and of Christian, daughter of the fourth Lord Elphinstone. Sir Thomas was hard pressed by his creditors, and after part of the family estate had been alienated received a "letter of protection" from his creditors from Charles I. in 1637. In the same year, his son Thomas and a younger one were accused of forcibly detaining their father in an upper room, but the matter was settled without further proceedings. Thomas was educated at King's College, Aberdeen, spending his spare time in the pursuit of physical science. On leaving the university he travelled over Europe, succeeded to his embarrassed inheritance, and got together a remarkable library, which, however, fell into the hands of his creditors. All his later life was disturbed by pecuniary and political difficulties. He was an enthusiastic Royalist; and, so far as religious matters went, his principles may be judged from his favourite signature, "C. P.," for Christianus Presbyteromastix. He took part in the "Trot of Turriff" in 1639, and was rewarded by being knighted on 7th April 1641 by the king's own hand at Whitehall. He took occasion by this visit to London to see through the press his first work, a collection of *Epigrams* of no great merit. Four years later, in 1645, he produced a tract called *Trissotetras*, a treatise on logarithms, adjusted to a kind of memoria technica, like that of the scholastic logic. In 1649 he was proclaimed a rebel and traitor at the Cross of Edinburgh for taking part in the abortive rising at Inverness on behalf of Charles II. in that year; but no active proceedings were taken against him. He took part in the march to Worcester, and was there wounded and taken prisoner. His MSS. were destroyed after the battle, with the exception of a few pages of the preface to his *Universal Language.* Urquhart was imprisoned in the Tower and at Windsor, but was released by Cromwell's orders in 1651. He published in rapid succession during 1652 and 1653 three tracts with quaint titles and quainter contents. *Παντοχρονοχανον* is an amazing genealogy of the house of Urquhart up to Adam, with the names extemporized for the earlier ages in a kind of gibberish. *'Εκσκυβαλαυρον* is supposed to be a treatise on the virtues of a jewel found in the streets of Worcester. The jewel is the recovered sheets of his manuscript. The defence of his system for a universal language was supplemented by a eulogy of the Scottish character, as shown in the Admirable Crichton and others. Finally, in *Logopandecteision* he again handled the subject of a universal language. The *Translation of Rabelais* (Books I. and II.), which Urquhart produced in 1653, is of the highest value as literature, and, by general testimony, one of the great masterpieces of translation. Though by no means a close rendering, it reproduces the spirit of the original with remarkable felicity. The translation was reprinted in 1664; and in 1693 that of the Third Book was added. Next to nothing is known of Urquhart after 1553; it is said that he sought refuge, like other cavaliers, on the continent, and died (1660) of a fit of laughing, brought on by joy at hearing of the Restoration.

His original *Works*, with such scanty particulars of his life as are known, and with reproductions of two original and curious frontispieces, which represent him as a handsome and dandified wearer of full cavalier costume, were published by the Maitland Club (1834). See also *Sir Thomas Urquhart of Cromartie*, by John Willcock (1899), and the articles in the *New Review* (July 1897) and *Dict. Nat. Biog.* The Rabelais has been frequently reprinted; Peter Motteux's translation of the whole appeared in 1708, and Ozell's in 1737, each incorporating Urquhart's portions. Theodore Martin in 1838, and Henry Morley in 1883, published editions of Urquhart's text.

URSA MAJOR ("The Great Bear"), in astronomy, a constellation of the northern hemisphere, supposed to be referred to in the Old Testament (Job ix. 9, xxxviii. 22), mentioned by Homer, *Ἄρκτος θ', ἣν καὶ ἄμαξαν ἐπίκλησιν καλέουσι* (*Il.* 18. 487), Eudoxus (4th century B.C.) and Aratus (3rd century B.C.). The Greeks identified this constellation with the nymph Callisto (*q.v.*), placed in the heavens by Zeus in the form of a bear together with her son Arcas as "bear-warder," or Arcturus (*q.v.*); they named it Arctos, the she-bear, Helice, from its turning round the pole-star. The Romans knew the constellation as *Arctos* or *Ursa*; the Arabians termed the quadrilateral, formed by the four stars α, β, γ, δ, *Na'sh*, a bier, whence it is sometimes known as *Feretrum majus.* The Arabic name should probably be identified with the Hebrew name *'Ash* and *'Ayish* in the book of Job (see G. Schiaparelli, *Astronomy in the Old Testament*, 1905). Ptolemy catalogued 8 stars, Tycho 7 and Hevelius 12. Of these, the seven brightest (α of the 1st magnitude, β, γ, ϵ, ζ, η of the 2nd magnitude, and δ of the 3rd magnitude) constitute one of the most characteristic figures in the northern sky; they have received various names—Septentriones, the wagon, plough, dipper and Charles's wain (a corruption of "churl's wain," or peasant's cart). With the Hindus these seven stars represented the seven Rishis. α and β are called the "pointers," since they are collinear with, or point to, the pole-star. ξ *Ursae majoris* is a beautiful binary star, its components having magnitudes 4 and 5; this star was one of the first to be recognized as a binary— *i.e.* having two components revolving about their common centre of gravity—and the first to have its orbit calculated. ζ *Ursae majoris* is perhaps the best known double star in the northern hemisphere, the larger component is itself a spectroscopic double. The nebula M. 97 *Ursae majoris* is of the planetary type; the earl of Rosse observed two spiral condensations turning in opposite directions,—hence its name,—the "Owl nebula."

URSA MINOR ("The Little Bear"), in astronomy, a constellation of the northern hemisphere, mentioned by Thales (7th century B.C.) and by Eudoxus and Aratus. By the Greeks it was sometimes named *Cynosura* (Gr. *κυνός*, dog's; *οὐρά*, tail), alleging this to be one of the dogs of Callisto, who became *Ursa major*. The Phoenicians named it Phoenice, or the Phoenician constellation, possibly in allusion to the fact that the brightest star is α *Ursae minoris* or the pole-star, which being situated very close to the north pole is of incalculable service to navigators. Ptolemy catalogued 8 stars, Tycho Brahe 7 and Hevelius 12. α *Ursae minoris*, more generally known as the pole-star or *Polaris*, a star of the 2nd magnitude, describes a circle of 2° 25′ daily about the north pole; it has a 9th-magnitude companion, and is also a spectroscopic binary.

URSINS, MARIE ANNE DE LA TRÉMOILLE, Princess des (1642–1722), lady of the Spanish court, was the daughter of the duke of Noirmontier and his wife Renée Julie Aubri. She was born in 1642, and was married young to Adrien Blaise de Talleyrand, Prince de Chalais. Her husband, having been concerned in the duel of four against four, in which the duke of Beauvilliers was killed in 1663, was compelled to fly the country. He died soon afterwards in Spain, and his widow established herself in Rome. In 1675 she married Flavio Orsini, duke of Bracciano. The marriage was far from harmonious, but her husband left her his fortune. It brought her a series of lawsuits and troubles with Livio Odescalchi, who claimed that he had been adopted by the duke. At last the widow sold the title and estates to Odescalchi. She then assumed the title of Princess des Ursins, a corruption of Orsini, and was tacitly allowed to use it, though it had no legal existence. The Princess des Ursins had indulged in a great deal of unofficial diplomacy at Rome, more particularly with Neapolitans and Spaniards of rank, whom it was desirable to secure as French partisans in view of the approaching death of Charles II. of Spain, and the plans of Louis XIV. for placing his family on the Spanish throne. Her services were rewarded in 1699 by a pension which her spendthrift habits made necessary to her. When Philip, duke of Anjou, grandson of the French king, was declared heir by the will of Charles II., the princess took an active part in arranging his marriage with a daughter of the duke of Savoy. Her ambition was to secure the post of *Camarera Mayor*, or chief of the household to the young queen, a mere child of twelve. By quiet diplomacy, and the help of Madame de Maintenon, she succeeded, and in 1701 she accompanied the young queen to Spain. Till 1714 she was the most powerful person in the country. Her functions about the king and queen were almost those of a nurse. Her letters show that she had to put them to bed at night, and get them up in the morning. She gives a most amusing description of her embarrassments when she had to enter the royal bedroom, laden with articles of clothing and furniture. But if the *Camarera Mayor* did the work of a domestic servant, it was for a serious political purpose. She was expected to look after French interests in the palace, and to manage the Spanish nobles, many of whom were of the Austrian party, and who were generally opposed to foreign ways, or to interferences with the absurdly elaborate etiquette of the Spanish court. Madame des Ursins was resolved not to be a mere agent of Versailles. During the first period of her tenure of office she was in frequent conflict with the French ambassadors, who claimed the right of sitting in the council and of directing the government. Madame des Ursins wisely held that the young king should rely as much as possible on his Spanish subjects. In 1704 her enemies at the French court secured her recall. But she still had the support of Madame de Maintenon, and her own tact enabled her to placate Louis XIV. In 1705 she returned to Spain, with a free hand, and with what was practically the power to name her own ministry. During the worst times of the war of the Spanish Succession she was the real head of the Bourbon party, and was well aided by the spirited young queen of Philip V. She did not hesitate to quarrel even with such powerful personages as the Cardinal Archbishop of Toledo, Portocarrero, when they proved hostile, but she was so far from offending the pride of the nation, that when in 1709 Louis the XIV., severely pressed by the allies, threatened, or pretended, to desert the cause of his grandson, she dismissed all Frenchmen from the court and threw the king on the support of the Castilians. Her influence on the sovereigns was so strong that it would probably have lasted all through her life, but for the death of the queen. Madame des Ursins confesses in her voluminous correspondence that she made herself a burden to the king in her anxiety to exclude him from all other influence. She certainly rendered him ridiculous by watching him as if he were a child. Philip was too weak to break the yoke himself, and could only insist that he should be supplied with a wife. Madame des Ursins was persuaded by Alberoni to arrange a marriage with Elizabeth Farnese of Parma, hoping to govern the new queen as she had done the old. Elizabeth had, however, stipulated that she should be allowed to dismiss the *Camarera Mayor*. Madame des Ursins, who had gone to meet the new queen at Quadraque near the frontier, was driven from her presence with insult, and sent out of Spain without being allowed to change her court dress, in such bitter weather that the coachman lost his hand by frostbite. After a short stay in France, she went to Italy, and finally established herself in Rome, where she had the satisfaction of meeting Alberoni after his fall, and where she died on the 5th of December 1722. Madame des Ursins has the credit of having begun to check the overgrown power of the church and the Inquisition in Spain, and of having attempted to bring the finances to order.

A readable life of Madame des Ursins was published in Paris in 1858 by N. F. Combes, and there is an English life by C. Hill, *The Princess des Ursins in Spain* (London, 1899). See her *Lettres inédites*, edited by A. Geoffroy (Paris, 1859), and her correspondence with Madame de Maintenon (Paris, 1826).

URSINUS, ZACHARIAS (1534–1583), German theologian, and one of the authors of the *Heidelberg Catechism* (*q.v.*), was born at Breslau on the 18th of July 1534, and became a disciple of Melanchthon at Wittenberg. He afterwards studied divinity at Geneva under Calvin, and Hebrew at Paris under Jean Mercier. In 1561 he was appointed professor in the Collegium Sapientiae at Heidelberg, where in 1563 at the instance of the elector-palatine, Frederick III., he drew up the *Catechism* in co-operation with Kaspar Olevian. The death of the elector in 1576 led to the removal of Ursinus, who from 1578 till his death in 1583 occupied a professorial chair at Neustadt-an-der-Haardt.

His *Works* were published in 1587–89, and a more complete edition by his son and two of his pupils, Pareus and Reuterus, in 1612.

URSULA, ST, and her companions, virgins and martyrs, are commemorated by the Roman Catholic church on the 21st of October. The *Breviary* gives no legend; but in current works, such as Butler's *Lives of the Saints*, it is to the effect that "these holy martyrs seem . . . to have met a glorious death in defence of their virginity from the army of the Huns. . . . They came originally from Britain, and Ursula was the conductor and encourager of the holy troop." The scene of the martyrdom is placed near the lower Rhine.

The date has been assigned by different writers to 238, *c.* 283 and *c.* 451. The story, however, is unknown both to Jerome and to Gregory of Tours—and this though the latter gives a somewhat detailed description of the Cologne church dedicated to that Theban legion with which the tradition of the martyred virgins was very early associated. The story of their fate is not entered under 21st October in the martyrology of Bede (*ob. c.* 735), of Ado (*c.* 858), of Usuard (*ante* 877), Notker Balbulus (896) or Hrabanus Maurus (845); but a 9th-century life of St Cunibert (*ob.* 663) associates a prominent incident in the life of this saint with the basilica of the sacred virgins at Cologne (Surius vi. 275, ed. 1575). Not only does Archbishop Wichfrid attest a grant to the church of the sacred virgins outside the walls of Cologne (in 927), but he was a large donor in his own person. Still earlier a Cologne martyrology, written, as Binterim (who edited it in 1824) argues, between 889 and 891, has the following entry under 21st October: "xi. virg. Ursule Sencie Gregorie Pinose Marthe Saule Britule Satnine Rabacie Saturie Paladie." Much shorter entries are found in two of the old martyrologies printed in Migne (cxxxviii. 1207, 1275). A more definite allusion to the legend may be found (*c.* 850) in Wandelbert of Prüm's metrical martyrology (21st October):

> "Tunc numerosa simul Rheni per littora fulgent
> Christo virgines erecta tropaea maniplis
> Agrippinae urbi, quarum furor impius olim
> Millia mactavit ductricibus inclyta sanctis."

The full legend first makes its appearance in a festival discourse (*sermo*) for the 21st of October, written, as internal evidence seems to show, between 731 and 839. This *sermo* does not mention St Ursula, but makes Pinnosa or Vinnosa the leader of these spiritual "amazons," who, to avoid Maximian's persecution, left their island home of Britain, following their bridegroom Christ towards that East whence their faith had come a hundred years before. The concurrent traditions of Britain, Batavia, *i.e.* the Netherlands (where many chapels still preserved their memory), and Cologne are called in evidence to prove the same origin. The legend was already very old and the festival "nobis omni tempore celeberrima"; but, as all written documents had disappeared since the burning of the early church erected over the sacred bones, the preacher could only appeal to the continuous and careful memory of the society to which he belonged (*nostrates*). Even in his time there were sceptics who pointed dubiously to the full-grown bones of "widows" and of men among the so-called virgin relics. The author of the *sermo* pointedly rejects the two theories that connected the holy virgins with the Theban band and brought them as pilgrims from the East to the West; but he adds that even in his days there still existed an inscription in the church, showing how it had been restored from its foundations by a certain "*Clematius, vir consularis, ex partibus Orientis.*"

Two or three centuries later the *Passio XI. MM. SS. Virginum*, based apparently on the revelations made to Helentrude, a nun of Heerse near Paderborn, gives a wonderful increase of detail. The narrative in its present form may date somewhere between 900 and 1100, while Helentrude apparently flourished before 1050. According to her account, the son of a powerful pagan king demands in marriage Ursula, the beautiful daughter of Deonotus, a king "in partibus Britanniae." Ursula is warned by a dream to demand a respite of three years, during which time her companions are to be 11,000 virgins collected from both kingdoms. After vigorous exercise in all kinds of manly sports, to the admiration of the populace, they are carried off by a sudden breeze in eleven triremes to Thiel on the Waal in Gelderland. Thence they sail up the Rhine by way of Cologne to Basel, at which place they make fast their vessels and proceed on foot to Rome. Returning, they re-enter their ships at Basel, but are slaughtered by the Huns when they reach Cologne. Their relics are then collected and buried "sicut hodie illic est cernere," in a spot where "to this day" no meaner sepulture is permitted. Then follows the usual allusion to Clematius; the date is expressly fixed at 238, and the whole revelation is seemingly ascribed to St Cordula, one of the 11,000 who, after escaping death on the first day by hiding in one of the vessels, on the morrow gave herself up to death of her own accord. Towards the beginning of the 12th century Sigebert of Gembloux (*ob.* 1112) gives a brief *résumé* of the same story. He is the first to introduce the name of Attila, and dates the occurrence 453.

Passing over the visions and exhumations of the first half of the 12th century, we come to the singular revelations of St Elizabeth of Schönau. These revelations, delivered in Latin, German or a mixed jargon of both languages, were turned into simple Latin by Elizabeth's brother Egbert, from whose words it would seem that in 1156 an old Roman burial-ground had lately been laid open near Cologne. The cemetery was naturally associated with the legend of St Ursula; and, this identification once accepted, it is not unlikely that when more careful investigations revealed male skeletons and tombstones bearing the names of men, other and more definite epitaphs were invented to reconcile the old traditions with the facts of such a damaging discovery. Hence perhaps the barefaced imposture: "Cyriacus, papa Romanus, qui cum gaudio suscepit sanctas virgines et cum eis Coloniam reversus martyrium suscepit." One or two circumstantial forgeries of this kind would form the basis of a scheme for explaining not a few other problems of the case, such as the plain inscription "Jacobus," whom St Elizabeth promptly transformed into a supposititious British archbishop of Antioch, brother to the equally imaginary British Pope Cyriacus. For these epitaphs, with others of a humbler kind, were brought before St Elizabeth to be identified in her ecstatic converse with St Verena, her cousin St Ursula, and others. Elizabeth herself at times distrusted her own revelations: there was no Cyriac in the list of the popes; Antherus, who was said to be his successor (235–36), died more than two centuries before Attila, to whom common report assigned the massacre; and it was hardly credible that James of Antioch could cut 11,000 epitaphs in less than three days. Every doubt, however, was met by the invention of a new and still more improbable detail. According to St Verena, the virgins suffered when Maximus and "Africanus" were *principes* at Rome (? 387–88).

In 1183 the mantle of St Elizabeth fell upon Hermann Joseph, a Praemonstratensian canon at Steinfeld. He had to solve a more difficult problem than St Elizabeth's; for the skeletons of little children, ranging in age from two months to seven years, had now been found buried with the sacred virgins. But even such a difficulty Hermann explains away: the little children were brothers, sisters or more distant relatives of the 11,000. Hermann's revelations are mainly taken up with an attempt to show the mutual relationship of nearly all the characters he introduces. The names are a most extraordinary mixture. Among British bishops we have Michael, William, James and Columbanus. Sovereign princes—an Oliver, a Clovis and a Pepin—start out in every page, till the writer finds it necessary to apologize for the number of his kings and his own blunders. But, for all this, Hermann exposes his own doubts when he tells that often, as he was preparing to write, he heard a voice bidding him lay down the pen, "for whatever you write will be an unmixed lie." Hermann makes St Ursula a native of Brittany, and so approximates to the version of the story given by Geoffrey of Monmouth (*Historia Britonum*), according to whom Maximian, after fleeing from Rome and acquiring Britain by marriage, proceeds to conquer Brittany and settle it with men from the island opposite. For these settlers he has to find British wives, and to this end collects 11,000 noble and 60,000 plebeian virgins, who are wrecked on their passage across. Certain of the vessels being driven upon "barbarous islands," their passengers are slain by Guanius and Melga, "kings of the Huns and Picts," whom Gratian had called in to his aid against Maximian. In this version St Ursula is a daughter of Dionotus, king of Cornwall. Hermann alludes more than once to the *Historia Britonum*, and even to King Arthur.

The legend of St Ursula is perhaps the most curious instance of the development of an ecclesiastical myth. Even in the earliest form known to us this legend is probably the complex growth of centuries, and any claim to the discovery of the first germ can hardly approve itself to the historic sense. These remarks apply especially to that venerable rationalization which evolves the whole legend from a misreading of *Undecimilla*, the name of Ursula's companion, into *undecim millia, i.e.* 11,000. A more modern theory makes St Ursula the Christianized representative of the old Teutonic goddess Freya, who, in Thuringia, under the name of Hörsel or Ursel, and in Sweden Old Urschel, welcomed the souls of dead maidens. Not a few singular coincidences seem to point in the same direction, especially the two virgins, "Martha and Saula," whom Usuard states to have suffered "cum aliis pluribus" on the 20th of October, whence they were probably transferred to the 21st. It is curious to note that Jerome and many of the earliest martyrologies extant have on the 21st of October the entry, "Dasius Zoticus, Gaius *cum duodecim militibus*." Even in copies of Jerome this is transformed into *millibus*; and it is perhaps not impossible that to this misreading we may indirectly owe the "thousands" in the Ursula legend. The two entries seem to be mutually exclusive in all the early martyrologies mentioned in this article, and in those printed in Migne, cxxxvii. The earlier "Dasius" entry seems to disappear steadily, though slowly, as the Ursula legend works its way into current martyrologies.

See H. Crombach, *Vita et Martyrium S. Ursulae* (Cologne, 1647), and the Bollandist *Acta Sanctorum*, 21st October, where the story fills 230 folio pages. The rationalization of the story is to be found in Oscar Schade, *Die Sage von der heiligen Ursula* (Hanover, 1854), of which there is a short *résumé* in S. Baring-Gould's *Lives of the Saints*. See also S. Baring-Gould, *Popular Myths of the Middle Ages*; A. G. Stein, *Die Heilige Ursula* (Cologne, 1879). The credibility of some of the details was doubted as early as the 13th century by Jacobus de Voragine in the *Legenda aurea*. For further works, especially medieval, see A. Potthast, *Bibliotheca hist. med. aevi* (Berlin, 1896), p. 1616. (T. A. A.; A. J. G.)

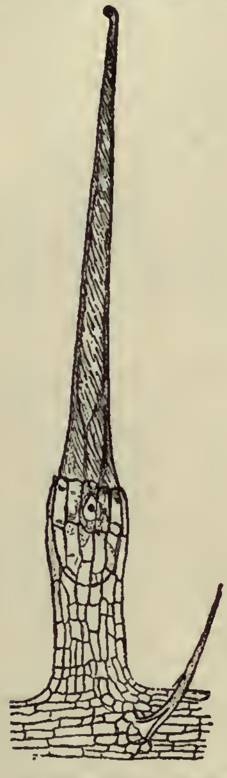
URSULINES, a religious order founded at Brescia by Angela Merici (1470–1540) in November 1535, primarily for the education of girls and the care of the sick and needy. It was approved in 1544 by Paul III., and in 1572 Gregory XIII., at the instance of Charles Borromeo, declared it a religious order under the rule of St Augustine. In the following century it was powerfully encouraged and supported by St Francis of Sales. In most cases, especially in France, the sisters adopted enclosure and took solemn vows; they were called the "religious" Ursulines as distinct from the "congregated" Ursulines, who preferred to follow the original plan. There were Ursulines in Canada in 1639, who taught the catechism to Indian children, and subsequently helped to preserve a religious spirit among the French population and to humanize the Indians and half-breeds. Towards the beginning of the 18th century, the period of its greatest prosperity, the order embraced some 20 congregations, with 350 convents and from 15,000 to 20,000 nuns. The members wear a black dress bound by a leathern girdle, a black sleeveless cloak, and a close-fitting head-dress with a white veil and a longer black veil. Their patron is the St Ursula mentioned above. The founder was beatified by Clement VIII. in 1768 and canonized as St Agnes of Brescia by Pius VII. in 1807. The Irish Ursulines were established at Cork in 1771 by Miss Nano Nagle. The Ursulines do not increase now as rapidly as they did, congregations taking simple vows like the Sisters of Mercy being apparently more adapted to modern needs.

URSWICK, CHRISTOPHER (1448–1522), English diplomatist, was born at Furness in Lancashire and was probably educated at Cambridge. He became chaplain to Margaret, countess of Richmond and Derby, and was employed by her to forward the schemes for securing the English throne for her son, Henry of Richmond, afterwards Henry VII. He crossed from Harfleur to Wales with Henry in August 1485, and was present at the battle of Bosworth; then followed for him a series of ecclesiastical preferments, the most important of which was to the deanery of York. He was sent on several weighty embassies, including one to Ferdinand and Isabella of Spain to arrange the marriage between Prince Arthur and Catherine of Aragon, and another to France in 1492, when he signed the treaty of Etaples. In 1495 he became dean of Windsor, and he died on the 24th of March 1522. Urswick was very friendly with Erasmus and with Sir Thomas More. He did some building at Windsor, and one of the chapels in St George's chapel there is still called the Urswick chapel. Urswick's kinsman, Sir Thomas Urswick, was a Yorkist partisan, who was recorder of London and chief baron of the exchequer.

See Urswick, *Records of the Family of Urwick or Urswick* (1893).

URTICACEAE (nettle family), in botany, an order of Dicotyledons belonging to the series Urticiflorae, which includes also Ulmaceae (elm family), Moraceae (mulberry, fig, &c.) and Cannabinaceae (hemp and hop). It contains 41 genera, with about 500 species, mainly tropical, though several species such as the common stinging nettle (*Urtica dioica*) are widely distributed and occur in large numbers in temperate climates. Two genera are represented in the British Isles, *Urtica* (see NETTLE) and *Parietaria* (pellitory, *q.v.*).

The plants are generally herbs or somewhat shrubby, rarely, as in some tropical genera, forming a bush or tree. The simple, often serrated, leaves have sometimes an alternate sometimes an opposite arrangement and are usually stipulate—exstipulate in *Parietaria*. The position of the stipules varies in different genera; thus in *Urtica* they are lateral and distinct from the leaf-stalk, in other cases they are attached on the base of the leaf-stalk or stand in the leaf-axil when they are more or less united. Stinging hairs often occur on the stem and leaves (fig. 1). The bast-fibres of the stem are generally long and firmly attached end to end, and hence of great value for textile use. Thus in ramie (*q.v.*, *Boehmeria nivea*) a single fibre may reach nearly 9 in. in length, and in stinging nettle as much as 3 in. The small inconspicuous regular flowers (figs. 3 and 4) are arranged in definite (cymose) inflorescences often crowded into head-like clusters. They are unisexual and monoecious or dioecious. The four or five green perianth leaves (or sepals) are free or more or less united; the male flowers (fig. 2) contain as many stamens, opposite the sepals, which bend inwards in the bud stage, but when mature spring backwards and outwards, the anther at the same time exploding and scattering the pollen. The flowers are thus adapted for wind-pollination. The female flower contains one carpel bearing one style with a brush-like stigma and containing a single erect ovule. The fruit is dry and one-seeded; it is often enclosed within the persistent perianth. The straight embryo is surrounded by a rich oily endosperm.



From Strasburger's *Lehrbuch der Botanik*, by permission of Gustav Fischer.

FIG. 1.—Stinging Hair of *Urtica dioica*, with a portion of the epidermis, and, to the right, a small bristle (×60).

FIG. 2.—Male Flower of the Nettle (*Urtica*). The four sepals are arranged symmetrically, an outer median and an inner lateral pair. A stamen is opposite each sepal, and in the centre of the flower is the rudiment of a pistil.

From Vines's *Students' Text-Book of Botany*, by permission of Swan Sonnenschein & Co.

FIG. 3.—*A* staminal (♂), *B* carpellary (♀) flower of the Nettle. *p*, perianth; *a*, stamen; *n'*, rudimentary ovary of the ♂ flower; *ap*, outer, *ip*, inner, whorl of the perianth; *n*, stigma of the ♀ flower (enlarged).

FIG. 4.—*Urtica urens* (after Curtis, *Flora Londinensis*), ½ nat. size. 1, male flower; 2, female flower in fruiting stage—the dry compressed fruit 3 escaping from the persistent perianth; 4, fruit cut open, revealing the seed within the large straight embryo *e*. 1, 2, 3, enlarged.

URUGUAY (officially the *Oriental Republic of the Uruguay*, and long locally called the *Banda Oriental*, meaning the land on the eastern side of the river Uruguay, from which the country takes its name), the smallest independent state in South America. It runs conterminous with the southern border of Brazil, and lies between 30° and 35° S. and between 53° 25′ and 57° 42′ W. (for map, see ARGENTINA). It has a seaboard on the Atlantic Ocean of 120 m., a shore-line to the south on the Rio de la Plata of 235 m., and one of 270 m. along the Uruguay on the west. The boundaries separating it from Rio Grande do Sul, a province of Brazil, are Lake Mirim, the rivers Chuy, Jaguarão and Quarahy, and a *cuchilla* or low range of hills called Santa Ana. The extent of the northern frontier is 450 m. The southern half of the country is mostly undulating grass land, well watered by streams and springs. The northern section is more broken and rugged; barren ridges and low rocky mountain-ranges, interspersed with fertile valleys, being its characteristic features. There is no forest, timber of any size being found only in the valleys near running water. Uruguay is intersected nearly from west to north-east by the river Negro and its affluent the Yi. The Uruguay is navigable all the year by steamers from the island of Martin Garcia at the mouth to Salto (200 m.). Above this place the navigation is interrupted by rapids. The ordinary volume of water in the Uruguay averages 11 millions of cub. ft. per minute. Excluding the Uruguay, the Negro, of which the principal port is Mercedes, is the principal navigable river. Others are navigable only for short distances by steamers of light draught. Besides the rivers mentioned, the chief streams are the Santa Lucia, which falls into the Plata a little west of Montevideo; the Queguay, in Paysandú; and the Cebollati, rising in the sierras in Minas and flowing into Lake Mirim. These rivers as well as the Uruguay are fed by innumerable smaller streams or *arroyos*, such as the Arapey in Salto, the Dayman in Paysandú, the Jaguary (an affluent of the Negro) in Tacuarembo, the Arroyo Grande between the departments of Soriano and San José, and the San José (an affluent of the Santa Lucia). None of the sierras or mountains in Uruguay exceeds (or perhaps even attains) a height of 2000 ft.; but, contrasting in their tawny colour with the grassy undulating plains, they loom high and are often picturesque. They are ramifications of the highlands of Brazil. The main chains are the Cuchilla de Haedo on the north and west and the Cuchilla Grande on the south and east.

Geology.—Little is known of the geology of Uruguay. There is a foundation of schists and crystalline rocks upon which rests a series of sandstones. The latter is, no doubt, identical with the similar sandstone series which is found in the neighbouring Brazilian province of Rio Grande do Sul, and which has there yielded plants which prove it to belong to the Permian or the upper part of the Carboniferous. The plains are covered by a formation similar to that of the Argentine pampas and by the alluvial deposits of the present rivers.

Climate.—Uruguay enjoys the reputation of possessing one of the most healthy climates in the world The geographical position ensures uniformity of temperature throughout the year, the summer heat being tempered by the Atlantic breezes, and severe cold in the winter season being unknown. Endemic diseases are unknown and epidemics are rare. In the interior, away from the sea and the shores of the great rivers, the temperature frequently rises in summer to 86° F. and in winter falls to 35°·6. In the districts bordering on the coast the thermometer seldom falls below 37°; and only for a few moments and at long intervals has it been known to rise as high as 105°. The annual rainfall is about 43 in.

Flora.—The pastoral wealth of Uruguay, as of the neighbouring Argentine Republic, is due to the fertilizing constitutents of "pampa mud," geologically associated with gigantic antediluvian animals, whose fossil remains are abundant. The country is rich in hard woods, suitable for cabinet work and certain building purposes. The principal trees are the alder, aloe, palm, poplar, acacia, willow and eucalyptus. The *montes*, by which are understood plantations as well as native thickets, produce among other woods the algarrobo, a poor imitation of oak; the guayabo, a substitute for boxwood; the quebracho, of which the red kind is compared to sandalwood; and the urunday, black and white, not unlike rosewood. Indigenous palms grow in the valleys of the Sierra José Ignacio, also to some extent in the departments of Minas, Maldonado and Paysandú. The myrtle, rosemary, mimosa and the scarlet-flowered ceibo are common. The valleys within the hill ranges are fragrant with aromatic shrubs. In the plains below, the swards are gay with the scarlet and white verbena and other brilliant wild flowers. The country abounds in medicinal plants. The sarsaparilla even colours the water of the Rio Negro and gives it its name—the "black river."

Fauna.—Among wild animals the tiger or ounce—called in the Guaraní language the *ja-guá* or "big dog"—and the puma are found on the frontier of Brazil and on the wooded islets and banks of the larger rivers. The tapir, fox, deer, wild cat, wild dog, carpincho or water hog and a few small rodents nearly complete the list of quadrupeds. A little armadillo, the mulita, is the living representative of the antediluvian giants *Mylodon*, *Megatherium*, &c. The ostrich—*Rhea americana*—roams everywhere in the plains; and there are a few specimens of the vulture tribe, a native crow (lean, tall and ruffed), partridges and quails. Parakeets are plentiful in the *montes*, and the lagoons swarm with waterfowl. The most esteemed is the *pato real*, a large duck. Of the birds of bright plumage the humming-bird and the cardinal—the scarlet, the yellow and the white—are the most attractive. The fish of the lagoons and streams are coarse, and some of them primitive in type; but two or three kinds, found generally in the large rivers, are much prized. The varieties of fish on the sea coast are many and excellent. More than 2000 species of insects have been classified. The scorpion is rare, but large and venomous spiders are common. The principal reptiles are a lizard, a tortoise, the *vivora de la cruz* (a dangerous viper, so called from marks like a cross on its head) and the rattlesnake in Maldonado and the stony lands of Minas.

Area and Population.—The area of the republic is estimated at 72,210 sq. m., and has a population of 1,042,668 according to the census of 1908 (in 1900 it was 915,647). The country is divided into 19 departments, the area and the population of which, according to the census of 1908, are given in the subjoined table:—

Departments.	Area, Sq. Miles.	Population, 1908.
Artigas	4,392	26,298
Canelones	1,833	87,931
Cerro Largo	5,753	44,806
Colonia	2,192	54,679
Durazno	5,525	42,313
Flores	1,744	16,158
Florida	4,763	45,393
Maldonado	1,584	28,804
Minas	4,844	51,170
Montevideo	256	309,231
Paysandú	5,115	38,528
Rio Negro	3,269	19,909
Rivera	3,790	35,653
Rocha	4,280	34,110
Salto	4,863	46,304
San José	2,687	46,267
Soriano	3,560	39,431
Tacuarembo	8,074	46,927
Treinta-y-Tres	3,686	28,756
Total	72,210	1,042,668

The average density of population on the above figures is 12·9 per sq. m., ranging (exclusive of Montevideo) from 47·9 in Canelones to 5·8 in Tacuarembo and 6 in Artigas. The great majority of the foreign population are Italians or Spaniards, with lesser numbers, in descending scale, of Brazilian, Argentine and French birth. British, Swiss and Germans are comparatively few. In 1907, 26,105 Italian immigrants arrived, 21,927 Spanish, 2355 British, 2315 French and 1823 German.

The natives of Uruguay, though living in conditions similar to those of the Argentine population, are in general more reserved, showing more of the Indian type and less of the Spaniard. In the north there is a strong Brazilian element and the people are intensely conservative. The average annual birth-rate is about 35 per 1000, and the death-rate about 15·5. About 26% of the births are illegitimate. The principal towns are Montevideo, Salto, Paysandú and San José.

Agriculture.—The condition of agriculture is fairly satisfactory. In 1885 Uruguay imported most of her breadstuffs; now not only is wheat grown in sufficient quantities to meet the local demand, but a surplus (about 20,000 metric tons in 1908–9) is annually available for export. Land for farming purposes is expensive, and wages are high, leaving small profit, unless it happens that a man, with his family to assist him, works his own land. The farmers are chiefly Italians, Canary Islanders and Frenchmen. The principal crops in addition to wheat are oats, barley, maize, linseed and bird seed. Since 1890 the cultivation of the grape and the manufacture of wine have considerably extended, especially in the department of Salto, Montevideo, Canelones and Colonia. Red wine, a smaller quantity of white, grape alcohol and wine alcohol are produced. The olive-planting industry is becoming important; the trees thrive well, and the area devoted to their cultivation is annually increasing. Tobacco is also cultivated.

Cattle-breeding and sheep-farming, however, are the principal industries. The lands are admirably adapted for cattle-breeding purposes, although not capable of fattening animals. The cattle are destined chiefly for the *saladero* establishments for the preparation of *tasajo*, or jerked beef, for the Brazilian and Cuban markets, and for the Liebig factory, where large quantities of extract of meat are prepared for the European trade. Cattle-breeding is carried on in all parts of the republic, but chiefly in the departments of Salto, Paysandú and Rio Negro. In the southern districts, where the farmers are Europeans, the breed of cattle is being steadily improved by the introduction of Durham and Hereford bulls. Dairy-farming is making some progress, especially in the Swiss colony near San José.

Sheep-farming flourishes chiefly in Durazno and Soriano. Uruguayan wool is favourably regarded in foreign markets, on account of the clean state in which it is shipped, this being largely due to the natural conditions of the land and climate. The business of shipping live sheep and frozen mutton has not been attempted on a large scale, owing principally to the lack of facilities for loading at the port of Montevideo or elsewhere.

Mining.—Minerals are known to exist in the northern section of the republic, and gold-mining is carried on to a small extent. Expert opinions have been advanced stating that gold-mining in Uruguay is capable of development into an important industry. The other minerals found are silver, lead, copper, magnesium and lignite coal.

Commerce.—The economic development of Uruguay was retarded by the corruption of successive governments, by revolutionary outbreaks, by the seizure of farm stock, without adequate compensation, for the support of military forces, by the consequences of reckless borrowing and over-trading in 1889 and 1890, and also by the transference of commercial undertakings from Montevideo to Buenos Aires between 1890 and 1897, on the opening of the harbour and docks at that port. The annual value of the imports (4·7 dollars taken at £1) was £5,101,740 in 1900 and £7,365,703 in 1908; that of exports was £6,257,600 in 1900 and £7,932,026 in 1908.

The principal imports consist of machinery, textiles and clothing, food substances and beverages, and live stock. The chief exports are animal products and agricultural products. Of the imports about 27% in value are from Great Britain, 14% from Germany, and smaller proportions from France, Argentina, Italy, Spain, the United States and Belgium. Of the exports, France, Argentina, Belgium and Germany take the bulk. Trade is controlled by foreigners, the British being prominent in banking, finance, railway work and the higher branches of commerce; Spaniards, Italians and French in the wholesale and retail trade. Uruguayans find an insignificant place in commerce. The foreign trade passes mainly through Montevideo, where the port has been greatly improved.

In addition to the natural lines of communication provided by the rivers bordering on or belonging to the republic, there are about 2240 m. of national road, besides more than 3000 m. of departmental roads. The railways had a length of 1380 m. open for traffic, and the system is steadily extending. There are over 170 m. of tramway in operation.

Government.—The legislative power of the state rests with the general assembly, consisting of two chambers, one of senators (19 in number) and one of representatives (75). The deputies of the lower house are elected for three years directly by the people, one deputy for every 3000 male adults who can read and write. One senator is named for each department by an electoral college, whose members are elected directly by the people. The senators are elected for six years, and one-third of their number retire every two years. The executive power is exercised by the president of the republic, who is elected by the general assembly for a four years' term. He is assisted by a council of ministers representing the departments of the interior, foreign affairs, finance, war and marine, industry, labour and instruction and public works. Each department or province of the republic has a governor appointed by the executive, and an administrative council, whose members are chosen by popular vote. The judicial power is vested in a high court and many subordinate courts. The general assembly elects the five judges who compose the high court. There are civil, commercial and criminal courts in Montevideo, a departmental court in each departmental capital, and a justice of the peace in each of 205 judicial districts into which the republic is divided, with sub-district courts under deputy judges in addition. The administration of justice in Uruguay has long been of bad repute. It was reformed on the above lines in 1907.

Education is much neglected, and the public-school system is inefficient. The attendance of children at the schools is small, and the instruction they receive is inferior. Primary instruction is nominally obligatory; nevertheless at the beginning of the 20th century nearly half the population over six years of age was illiterate. Montevideo possesses a university and a number of preparatory schools, a state-supported technical school and a military college. The state religion is Roman Catholic, and there is an archbishop of Montevideo with two suffragan bishops. A number of seminaries are maintained throughout the republic. Other religions are tolerated.

Army.—There is a standing army with a peace strength of about 7000 officers and men. Service is nominally voluntary, though it appears that a certain amount of compulsion is exercised. In addition to this there is compulsory service in the National Guard (*a*) in the first class, consisting of men between seventeen and thirty years of age, liable for service with the standing army, and numbering some 15,000; (*b*) in the second class, for departmental service only, except in so far as it may be drawn upon to make up losses in the more active units in time of war, consisting of men from thirty to forty-five years of age, and (*c*) in the third class, for local garrison duty, consisting of men between forty-five and sixty years old. The army and guard are well equipped with modern arms.

Finance.—Of the national revenue nearly half is derived from customs duties, taxes being levied also on real estate, licences, tobacco, stamped paper and in other ways. Nearly half the expenditure goes to meet debt charges, while government, internal development and defence absorb most of the remainder. The receipts for the years specified were as follows, Uruguayan dollars being converted into sterling at the par value, 4·7 = £1:—

Years.	Revenue.	Expenditure.
1894–1895	£3,403,324	..
1899–1900	3,236,300	..
1904–1905	3,438,300	£3,438,510
1909–1910[1]	4,971,660	4,704,500

[1] Estimate.

In 1891, when the debt of the republic amounted to $87,789,973, or about £18,678,710, the government suspended payment of interest, and an arrangement was made with the bondholders. A new consolidated debt of £20,500,000 was issued at 3½% interest, and, as security for payment of interest, 45% of the customs receipts at Montevideo was assigned. At the same time the interest guaranteed to the railway companies was reduced from 7 to 3½%. In 1896 a 5% loan of £1,667,000 was issued, and the debt was subsequently increased, until on January 1, 1909, it was £27,692,795, and in the same year the annual debt charge amounted to £2,185,347.

The Bank of the Republic was established in 1896 with a nominal capital of $12,000,000, and in 1899 it received the right to issue further shares amounting to $5,000,000. Its note issue (for which it has an exclusive right) may not exceed the value of half the subscribed capital. Besides a number of local banks, branches of German, Spanish, French and several British banks are established in Montevideo.

There is no Uruguayan gold coin in circulation, but the theoretical monetary unit is the gold *peso nacional*, weighing 1·697 grammes, ·917 fine. The silver peso weighs 25 grammes, ·900 fine. A half, fifth and tenth of a peso are coined in silver, in addition to bronze coins.

The metric system of weights and measures has been officially adopted, but the old Spanish system is still in general use.

History.—In 1512 Juan Diaz de Solis entered the Paranaguazu or "sealike" estuary of the Plata and landed about 70 miles east of the present city of Montevideo. Uruguay at that time was inhabited by Indians, of whom the dominant tribe was called Charrua, a people described as physically strong and well-formed, and endowed with a natural nobility of character. Their habits were simple, and they were disfigured neither by the worst crimes nor by the primitive superstitition of savages. They are said to have revealed no vestige of religion. The Charruas are generally classified as a yellow-skinned race, of the same family as the Pampa Indians; but they are also represented as tanned almost black by the sun and air, without any admixture of red or yellow in their complexions. Almost beardless, and with thin eyebrows, they had on their heads thick, black, lustrous hair, which neither fell off nor turned grey until extreme old age. They lived principally upon fish, venison and honey. In the Guarani language "Charrua" means turbulent, and by their enemies the Charruas were accounted as such, and even ferocious, although admitted to be generous to their captives. They were a curiously taciturn and reticent race. Their weapons were the bow and arrow and stones.

Solis, on his second visit, 1515–1516, was slain by the Charruas in Colonia. Eleven years later Ramon, the lieutenant of Sebastian Cabot, was defeated by the same tribe. In 1603 they destroyed in a pitched battle a veteran force of Spaniards under Saavedra. During the next fifty years three unsuccessful attempts were made by the Spaniards to subdue this courageous people. The real conquest of Uruguay was begun under Philip III. by the Jesuit missions. It was gradually consummated by the military and commercial settlements of the Portuguese, and subsequently by the Spaniards, who established themselves formally in Montevideo under Governor Zavala of Buenos Aires in 1726, and demolished the rival Portuguese settlement in Colonia in 1777. From 1750 Montevideo enjoyed a provincial government independent of that of Buenos Aires. The American rebellion, the French Revolution and the British invasions of Montevideo and Buenos Aires (1806–7), under Generals Auchmuty (1756–1822) and John Whitelocke (1757–1833), all contributed to the extinction of the Spanish power on the Rio de la Plata. During the War of Independence, Montevideo was taken in 1814 by the Buenos-Airean general Alvear (see further MONTEVIDEO). A long struggle for dominion in Uruguay between Brazil and the revolutionary government of Buenos Aires was concluded in 1828, through the mediation of Great Britain, Uruguay being declared a free and independent state. The republic was formally constituted in 1830. Subsequently Juan Manuel Rosas, dictator of Buenos Aires, interfered in the intestine quarrels of Uruguay; and Montevideo was besieged by his forces, allied with the native partisans of General Oribe, for nine years (1843–52).

After the declaration of independence the history of Uruguay becomes a record of intrigues, financial ruin, and political folly and crime. The two great political factors for generations have been the Colorados and the Blancos. So far as political principles are concerned, there is small difference between them. Men are Colorados or Blancos largely by tradition and not from political conviction. The Colorados have held the government for many years, and the attempts of the Blancos to oust them have caused a series of revolutions. The military element, moreover, has frequently conspired to elect a president amenable to its demands. In 1875 General Latorre headed a conspiracy against President Ellauri and at first placed Dr Varela in power as dictator, but in 1876 proclaimed himself. In the following year Latorre caused himself to be elected president, but political unrest caused him to resign in March 1880. The president of the senate, Dr Vidal, nominally administered the government for two years, when General Santos, who had held the real power, became president. His administration was so vicious and tyrannical that the opposition organized a revolution. Their forces, however, were surprised by the government troops at Quebracho, on the Rio Negro, and defeated. Ultimately the Colorados themselves exiled Santos. He had plundered the national revenues and scorned constitutional government. The Colorados now made General Tajes president, the practical direction of the administration being in the hands of Julio Herrera y Obes. In March 1890 General Tajes handed over the presidency to Herrera y Obes, a clever but unscrupulous man, who filled every official post with his own friends and ensured the return of his supporters to the chamber. In 1891 he was obliged to suspend the service of the public debt and make arrangements by which the bondholders accepted a reduced rate of interest. The country was at this period conducted practically as if it were the private estate of the president, and no accounts of revenue or expenditure were vouchsafed to the public. In 1894 the Colorados nominated Señor Idiarte Borda for the presidency. He seemed at first inclined to govern honestly, but corruption soon became as marked as under the preceding régime. The Blancos, using the fraudulent elections in 1896 as a pretext, now broke out in armed revolt under the leadership of Aparicio Saraiva. The president made no attempt to conciliate them, and in March 1897 a body of government troops suffered a reverse. On the 25th of August 1897 Borda, after attending a Te Deum at the cathedral in Montevideo, was shot dead by a man named Arredondo, who was sentenced in 1899 to two years' imprisonment. The defence was that the murder was a political offence, and therefore not punishable as an ordinary case of assassination for personal motives.

The president of the senate, Juan Cuestas, in accordance with the constitution, assumed the duties of president of the republic. He arranged that hostilities should cease on the conditions that representation of the Blancos was allowed in Congress for certain districts where their votes were known to predominate; that a certain number of the *jefes politicos* should be nominated from the Blancos; that free pardon be extended to all who had taken part in the revolt; that a sufficient sum in money be advanced to allow the settlement of the expenses contracted by the insurgents; and that the electoral law be reformed on a basis allowing the people to take part freely in elections. Cuestas, on attempting to reform corrupt practices, was soon threatened with another revolution, and on the 10th of February 1898 he assumed dictatorial powers, dissolved the Chambers and suspended all constitutional guarantees. In the following year he resigned and was re-elected to the presidency on the 1st of March 1899. His second term was marked by premonitions of further disorder. In July 1902 a plot for his assassination was frustrated, and in 1903, on the election of José Battle to the presidency, civil war broke out. On September 3, 1904, the revolutionary general Saraiva died of wounds received in battle; and later in the year peace was declared. Claudio Williman became president in 1907. The Colorados favoured Battle as his successor, and before the elections to the chamber in November 1910 the Blancos were again in arms.

URUGUAYANA, a city and river port of the state of Rio Grande do Sul, Brazil, on the left bank of the Uruguay river, 348 ft. above sea-level (at the R. R. station) and about 360 m. in a direct line W. of Porto Alegre. Pop. (1900) 13,638. A railway connects with Quarahim (47 m.) on the Uruguayan frontier, and thence by a Uruguayan line with Montevideo by way of Paysandú. The same line extends N. 62 m. to the naval station of Itaquy. A cross-country line was under construction in 1909 to Cacequy, which is in direct communication with Porto Alegre and the city of Rio Grande. The upper Uruguay is navigable from the Quarahim to the town of São Tomé, and small river steamers ply regularly between Ceibo, on the Argentine side, and the latter. Opposite Uruguayana is the Argentine town of Restauracion, or Paso los Libres. The river is 2 m. wide at this point, and 154 ft. above sea-level. Uruguayana is prettily situated on a low hill rising gently from the riverside and its low houses are surrounded by orange groves. There are large military barracks near the shore, a theatre and a custom-house. The surrounding country is chiefly pastoral, but there is a small area under vineyards, and in addition to grapes some other fruits are produced. Uruguayana was captured by a Paraguayan force under General Estigarribia on the 5th of August 1865, and was recaptured without a fight by the allied forces under General Bartolomé Mitre on the 18th of September. The Paraguayan occupation left the town partially in ruins, and it remained in a decadent condition until near the end of the century, when reviving industries in the state and a renewal of railway construction promoted its commercial activity and growth.

USAS (from the root *vas*, to shine, and cognate to Latin *Aurora* and Greek Ἠώς,) in Hindu mythology, the goddess of dawn. She is celebrated in some twenty hymns of the Rig Veda, and is the most graceful creation of Vedic poetry. She is borne on a shining car drawn by ruddy cows or bulls. She is the daughter of the sky and the sun is her lover. She is described as " rising resplendent as from a bath, showing her charms she comes with light . . . ever shortening the ages of men she shines forth . . . she reveals the paths of men and bestows new life . . . she opens the doors of darkness as the cows their stalls." Scarcely the name of the goddess survives to-day, so completely was she associated with the Vedism long dead and gone.

See A. A. Macdonell, *Vedic Mythology* (Strassburg, 1897).

USEDOM, an island of Germany, in the Prussian province of Pomerania, lying off the Baltic coast, and separated by the Swine from the island of Wollin, which together with it divides the Stettiner Haff from the open sea. It is 31 m. in length, 13 broad and 160 sq. m. in area. The surface is generally flat (only a few sand-hills rising to any height) and is diversified by moor, fen, lakes and forest. Agriculture, cattle-rearing, fishing and other maritime pursuits are the chief occupations of the inhabitants. Swinemünde and Usedom (pop. 1700) are the chief towns, and Heringsdorf, Ahlbeck and Zinnowitz are frequented watering-places. Pop. (1900) 33,000.

See Gadebusch, *Chronik der Insel Usedom* (Anklam, 1863), and C. Müller, *Die Seebäder der Inseln Usedom und Wollin* (6th ed., Berlin, 1896).

USELIS (mod. *Usellus*), an ancient town of Sardinia, situated in the hills to the S.E. of Oristano, 900 ft. above sea-level. A bronze tablet of A.D. 158 (a *tabula patronatus*, setting forth that M. Aristius Balbinus had accepted the position of patron of the town for himself and his heirs) speaks of the place as *Colonia Julia Augusta Uselis*. From this it would seem that it had become a colony under Augustus, were it not that Pliny (*H.N.* iii. 85) asserts that Turris Libisonis was the only colony in Sardinia at his time. It may be that civic rights were obtained from Augustus (Th. Mommsen in *Corp. Inscr. Lat.* x. p. 816). The site of the ancient town is marked by the church of S. Reparata, and various antiquities have been found there. The episcopal see was transferred to Ales in the 12th century, though the old name is still officially used.

USES, in law, equitable or beneficial interests in land. In early law a man could not dispose of his estate by will nor could religious houses acquire it. As a method of evading the common law arose the practice of making feoffments to the *use* of, or upon trust for, persons other than those to whom the seisin or legal possession was delivered, to which the equitable jurisdiction of the chancellor gave effect. To remedy the abuses which it was said were occasioned by this evasion of the law was passed the famous Statute of Uses (1536), which, however, failed to accomplish its purpose. Out of this failure of the Statute of Uses arose the modern law of TRUSTS, under which heading will be found a full history of uses. See also CONVEYANCING.

USHAK, a town of Asia Minor, altitude 3160 ft. in the Kutaiah sanjak of the Brusa vilayet, situated in a fertile district, on a tributary of the Menderes, and connected with Smyrna and Konia by rail. Pop. 9000 Moslems and 2000 Christians. It is noted for its heavy pile carpets, *khali*, known as "Turkey carpets." The Oriental character of the carpets has been almost destroyed by the adoption of aniline dyes and the introduction of Western patterns. The town has a trade in valonia, cereals and opium.

USHANT (Fr. *Ouessant*), the most westerly of the islands off the coast of France, about 14 m. from the coast of Finistère, of which department it forms a canton and commune. Pop. (1906) 2761. Ushant is about 3850 acres in extent and almost entirely granitic, with steep and rugged coasts accessible only at a few points, and rendered more dangerous by the frequency of fogs. The island affords pasturage to a breed of small black sheep, and about half its area is occupied by cereals or potatoes. The male inhabitants are principally pilots and fishermen, the women working in the fields. Ushant was ravaged by the English in 1388. The lordship was made a marquisate in 1597 in favour of René de Rieux de Sourdéac, governor of Brest. In 1778 a naval action without decisive result was fought off Ushant between the English under Keppel and the French under the Count d'Orvilliers.

USHER (or USSHER), **JAMES** (1581–1656), Anglican divine and archbishop, was born in the parish of St Nicholas, Dublin, on the 4th of January 1581. He was descended from the house of Nevill, one of whose scions, accompanying John Plantagenet to Ireland in the capacity of usher in 1185, adopted his official title as a surname. James Usher was sent to a school in Dublin opened by two political agents of James VI. of Scotland, who adopted this manner of averting the suspicions of Elizabeth's government from their real object, which was to secure a party for James in Ireland in the event of the queen's death. In 1594 Usher matriculated at the newly founded university of Dublin, whose charter had just been obtained by his uncle, Henry Usher, archbishop of Armagh. He proved a diligent student, devoting much attention to controversial theology, graduated as M.A. in 1600 and became a fellow of Trinity College. On the death of his father in 1598 he resigned the family estate to his younger brother, reserving only a small rent-charge upon it for his own maintenance, and prepared to take orders. When he was but nineteen he accepted a challenge put forth by Henry Fitzsimons, a learned Jesuit, then a prisoner in Dublin, inviting discussion of Bellarmine's arguments in defence of Roman Catholicism, and acquitted himself with much distinction. In 1600 he was appointed proctor of his college and catechetical lecturer in the university, though still a layman, and was ordained deacon and priest on the same day, in 1601, while still under the canonical age, by his uncle the primate. In 1607 he became regius professor of divinity and also chancellor of St Patrick's cathedral, Dublin. He was a frequent visitor to England, and made the acquaintance of contemporary scholars like Camden, Selden, Sir Thomas Bodley and Sir Robert Cotton. In 1613 he published his first printed work, though not his first literary composition—*Gravissimae Quaestionis de Christianarum Ecclesiarum, in Occidentis praesertim partibus, ab Apostolicis temporibus ad nostram usque aetatem, continua successione et statu, Historica Explicatio*, wherein he took up the history of the Western Church from the point where Jewel had left off in his *Apology for the Church of England*, and carried it on from the 6th till past the middle of the 13th century, but never completed it. In 1615 he took part in an attempt of the Irish clergy to impose a Calvinistic confession, embodying the Lambeth Articles of 1595, upon the Irish Church, and was delated to King James in consequence. But on his next visit to England in 1619 he brought with him an attestation to his orthodoxy and high professional standing, signed by the lord deputy and the members of the privy council, which, together with his own demeanour in a private conference with the king, so influenced the latter that he nominated Usher to the vacant see of Meath, of which he was consecrated bishop in 1621. In 1622 he published a controversial *Discourse of the Religion anciently Professed by the Irish and British*, designed to show that they were in agreement with the Church of England and opposed to the Church of Rome on the points in debate between those churches. In 1623 he was made a privy councillor for Ireland, and in the same year was summoned to England by the king that he might more readily carry on a work he had already begun upon the antiquity of the British churches. While he was detained on this business the archbishop of Armagh died in January 1625, and the king at once nominated Usher to the vacant primacy; but severe illness and other causes impeded his return to Ireland until August 1626.

For many years Usher was actively employed both in the government of his diocese and in the publication of several learned works, amongst which may be specified *Emmanuel* (a treatise upon the Incarnation), published in 1638, and *Britannicarum Ecclesiarum Antiquitates*, in 1639. In 1629 he discountenanced Bishop William Bedell's proposal to revive the Irish language in the service. In 1634 he took part in the convocation which drafted the code of canons that formed the basis of Irish ecclesiastical law till the disestablishment of the Irish Church in 1869, and defeated the attempt of John Bramhall, then bishop of Derry and later his own successor in Armagh, to conform the Irish Church exactly to the doctrinal standards of the English. He put the matter on the ground of preserving the independence of the Irish Church, but the real motive at work was to maintain the Calvinistic element introduced in 1615. In 1640 he paid another visit to England on one of his usual scholarly errands, meaning to return when it was accomplished. But the rebellion of 1641 broke out while he was still at Oxford, and he never saw his native country again. He published a collection of tracts at Oxford in that year, including a defence of episcopacy and the doctrine of non-resistance. All Usher's property in Ireland was lost to him through the rebellion, except his books and some plate and furniture, but he was assigned the temporalities of the vacant see of Carlisle for his support. In 1643 he was offered a seat in the Assembly of Divines at Westminster, but declined it publicly in terms which drew upon him the anger of the House of Commons, and an order for the confiscation of his library was averted only by the interposition of Selden. He quitted Oxford in 1645 and went into Wales, where he remained till 1646, when he returned to London, and was in 1647 elected preacher to the Society of Lincoln's Inn, an office which he continued to hold until near his death. During his residence in Wales a hyper-Calvinistic work entitled *A Body of Divinity; or the Sum and Substance of the Christian Religion,* was published under his name by John Downham; and, although he repudiated the authorship in a letter to the editor, stating that the manuscript from which it was printed was merely a commonplace-book into which he had transcribed the opinions of Cartwright and other English divines, often disapproving of them and finding them dissonant from his own judgment, yet it has been persistently cited ever since as Usher's genuine work, and as lending his authority to positions which he had long abandoned, if he ever maintained them. In 1648 he had a conference with Charles I. in the Isle of Wight, assisting him in the abortive negotiations with parliament on the question of episcopacy. About this time Richelieu offered him a pension. In 1650–54 he published the work which was long accounted his most important production, the *Annales Veteris et Novi Testamenti,* in which he propounded a now disproved scheme of Biblical chronology, whose dates were inserted by some unknown authority in the margin of reference editions of the Authorized Version. In 1655 Usher published his last work, *De Graeca LXX Interpretum Versione Syntagma.* He died on the 20th of March 1656, in Lady Peterborough's house at Reigate, and was buried in Westminster Abbey. He was long remembered, not only for his great learning but for his modesty and kindly disposition. His daughter sold his library to the state, and in 1661 it was placed in the library of Trinity College, Dublin, of which it still forms a part.

Usher's works are very numerous, and were first collected by C. R. Elrington and J. H. Todd, Dublin (1847–64, in 17 vols.). See *Life* by Carr (1895); W. B. Wright, *The Ussher Memoirs* (1889).

USHER (O. Fr. *ussier*, *uissier*, mod. *huissier*, from Lat. *ostiarius*, a door-keeper, *ostium*, doorway, entrance, *os*, mouth), properly an official or servant who guards the entrance to a building, admits those who have the right of admission and keeps out strangers; such functions as the introduction of those who are admitted, the conducting them to their seats or to the presence of the persons receiving them and the keeping of order and silence are also performed by them. The "ushers" of a law-court are familiar officials of this kind. The name is also applied to various members of the British royal household, in which there are several "gentlemen-ushers." The four principal British orders of knighthood style one of their chief officers "usher"; thus there is a gentleman-usher of the Black Rod, who is also one of the high officials of the House of Lords (see further, Black Rod, and Knighthood and Chivalry, § *Orders of Knighthood*). A common usage of the word, now obsolescent, is for an undermaster at a school.

USK, THOMAS (d. 1388), the author of *The Testament of Love,* was born in London. His name was first added to the history of English literature in 1897 by Mr Henry Bradley's discovery that *The Testament of Love,* an important prose work hitherto attributed to Chaucer, bore in the initial letters of its chapters a statement of authorship—"Margarete of virtw, have merci on thin Usk." By the light of this perception, various autobiographical statements became luminous, and there remained no possible doubt that the author was Thomas Usk, who was clerk of the closet to John of Northampton when he was mayor of London from 1381 to 1383. In July 1384 Usk was seized and put in prison, but was released on promise of bringing charges against the mayor. Usk had no wish to be what he called "a stinking martyr," and he freely produced evidence which sent John of Northampton to gaol. For this he was not forgiven by the duke of Gloucester's party, although he continued to hold confidential posts in London until the close of 1386, when he was appointed sub-sheriff of Middlesex. But he fell with the king, in the triumph of the duke of Gloucester, and on the 3rd of February 1388 Usk, among others, was tried for treason and condemned. He was sentenced "to be drawn, hung and beheaded, and that his head should be set up over Newgate." John of Malvern, in his continuation of Ralph Higden's *Polychronicon,*[1] gives a horrid description of his execution, which occurred on the 4th of March 1388, in circumstances of rude barbarity; it took thirty blows of a sword to sever Usk's head from his shoulders. Professor Skeat has shown that the date of his book must be about 1387, for in it he reviews the incidents of his career, including the odd facts that, after his first imprisonment in 1384, he challenged any one who "contraried" his "saws"—that is to say, denied his allegations—to fight, but that no one took up his wager of battle. From 1381 to 1383, while Chaucer was comptroller of customs, Usk was collector, and they were doubtless acquainted. In *The Testament of Love,* the god is made to praise "mine own true servant, the noble philosophical poet in English," who had composed "a treatise of my servant Troilus." Usk had at one time been a Lollard, but in prison he submitted to the Church and thought he was forgiven. His solitary work is remarkable, and the most elaborate production in original English prose which the end of the 14th century has bequeathed to us. It is, however, excessively tedious, and of its obscurity and dullness a very amusing proof is given by the fact that successive editors—and even Dr Henry Bradley and Professor Skeat—did not discover till too late that the leaves of the original MS. had been shuffled and the body of the treatise misarranged. No MS. of *The Testament of Love* has been preserved; it was first printed by W. Thynne in his edition of *Chaucer,* 1532. In 1897 Professor Skeat, with cancelled sheets to cover the unlucky mistake above referred to, issued a revised and annotated text in his *Chaucerian and other Pieces.*

(E. G.)

USK, a river of Wales and England, rising on the borders of Carmarthenshire and Brecknockshire, and flowing to the Bristol Channel with a course of 70 m., and a drainage area of 540 sq. m. The source lies at an elevation of 1700 ft. on the north flank of Carmarthen Van, a summit of the Brecon Beacons; and the course is at first northerly, but soon turns east through a beautiful valley closely beset with lofty hills. The river passes the finely situated town of Brecon, and then turns south-east past Crickhowell and south past Abergavenny. Between these towns it forms a short stretch of the Welsh boundary before entering England (Monmouthshire). The valley now broadens, and the course of the river becomes sinuous as it flows by the ancient towns of Usk and Caerleon. The scenery throughout is most beautiful. Not far from the mouth lies Newport, with its extensive docks, to which the estuary gives access. Except in this part, the Usk is not used for navigation, but the Monmouthshire and Brecon and Abergavenny canals, in part following the valley, carry a small trade up to Brecon. The Usk is noted for its salmon and trout fishing.

USK, a small market town, is beautifully situated on the right bank of the Usk river, 10 m. N.N.E. of Newport. Pop. of urban district (1901), 1476. It unites with Newport and Monmouth to form the Monmouth parliamentary district of boroughs, returning one member. It is of high antiquity, occupying the site of a Roman-British village or fort; and there are picturesque ruins of an ancient castle erected in defence of the Welsh marches, and as such, a scene of frequent strife from Norman times until the days of the warlike Owen Glendower, about 1400. The church of St Mary originally belonged to a Benedictine nunnery of the 12th century.

USKOKS, or Uscocs. During the early years of the 16th century, the Turkish conquest of Bosnia and Herzegovina

[1] Ed. J. R. Lumby, Rolls Series (1886), vol. ix. p. 147.

drove large numbers of the Christian inhabitants from their homes. A body of these *Uskoks*, as they were called, from a Serbo-Croatian word meaning "refugee," established itself in the Dalmatian fortress of Clissa, near Spalato, and thence waged continual war upon the Turks. Clissa, however, became untenable, and the Uskoks withdrew to Zengg, on the Croatian coast, where, in accordance with the Austrian system of planting colonies of defenders along the Military Frontier, they were welcomed by the Emperor Ferdinand I., and promised an annual subsidy in return for their services. Their new stronghold, screened by mountains and forests, was unassailable by cavalry or artillery, but admirably suited to the light-armed Uskoks, whose excellence lay in guerilla warfare. The Turks, on their side, organized a body of equally effective troops called *Martelossi*, for defence and reprisals. Thus, checked on land, and with their subsidy rarely paid, the Uskoks turned to piracy. Large galleys could not anchor in the bay of Zengg, which is shallow and exposed to sudden gales, so the Uskoks fitted out a fleet of swift boats, light enough to navigate the smallest creeks and inlets of the Illyrian shore, and easily sunk and recovered, if a temporary landing became necessary. With these they preyed upon the commerce of the Adriatic. Their ranks were soon swelled by outlaws from all nations, and by their own once peaceful neighbours, from Novi, Ottočac and other Croatian towns. After 1540, however, Venice, as mistress of the seas, guaranteed the safety of Turkish merchant vessels, and provided them with an escort of galleys. The Uskoks retaliated by ravaging the Venetian islands of Veglia, Arbe and Pago, and by using the Venetian territories in Dalmatia as an avenue of attack upon the Turks. Meanwhile the corsairs of Greece and Africa were free to raid the unprotected southern shores of Italy; and Venice was besieged with complaints from the Porte, the Vatican, the Viceroy of Naples and his sovereign, the king of Spain. An appeal to Austria met with little success, for the offences of the Uskoks were outweighed by their services against the Turks; while, if Minucci may be trusted, a share of their spoils, in silk, velvet and jewels, went to the ladies of the Archducal Court of Graz, where the matter was negotiated. From 1577 onwards, Venice endeavoured to crush the pirates without offending Austria, enlisting Albanians in place of their Dalmatian crews, who feared reprisals at home. For a time the Uskoks only ventured forth by night, in winter and stormy weather. In 1592 a Turkish army invaded Croatia, hoping to capture Zengg, but it was routed and dispersed in the following year. Austria being thus involved in war with Turkey, the Venetian Admiral Giovanni Bembo blockaded Trieste and Fiume, whither the pirates forwarded their booty for sale. They also erected two forts to command the passages from Zengg to the open sea. In 1602 a raid by the Uskoks upon Istria resulted in an agreement between Venice and Austria, and the despatch to Zengg of the energetic commissioner Rabatta with a strong bodyguard. All these measures, however, availed little. Rabatta was murdered, the fugitive Uskoks returned to Zengg and piracy was resumed, with varying fortunes, until 1615, when a grosser outrage than usual led to open war between Venice and Austria. By the treaty of peace concluded at Madrid, in 1617, it was arranged that the Uskoks should be disbanded, and their ships destroyed. The pirates and their families were, accordingly, transported to the interior of Croatia, where they gave their name to the *Uskoken Gebirge*, a group of mountains on the borders of Carniola. Their presence has also been traced near Monte Maggiore, in Istria, where such significant family names as *Novlian* (from Novi), *Ottocian* (from Ottočac) and *Clissan* (from Clissa), were noted by Franceschi in 1879.

See Minuccio Minucci, *Historia degli Uscochi* (Venice, 1603); enlarged by P. Sarpi, and translated into French as a supplement to Amelot de la Houssaye's *Histoire du gouvernement de Venise* (Amsterdam, 1705). Minucci was one of the Venetian envoys at Graz. See also the conciser narratives in C. de Franceschi's *L'Istria*, chap. 37 (Parenzo, 1879); and T. G. Jackson's *Dalmatia, the Quarnero and Istria*, chap. 27 (Oxford, 1887).

USKÜB, Uscup, or Skopia (anc. *Scupi*, Turk. *Üshküb*, Slav. *Skoplye*), the capital of the vilayet of Kossovo, European Turkey; on the left bank of the river Vardar, and at the junction of the railways from Nish and Mitrovitza to Salonica. Pop. (1905) about 32,000, consisting chiefly of Slavs (Serbs and Bulgars), Turks, Albanians and a few gipsies. Usküb occupies a picturesque and strategically important position at the foot of a valley which severs two mountain ranges, the Shar Planina and Kara Dagh. Main roads radiate N.W. to Prizren, W. to Gostivar, an important centre of distribution, E.N.E. to Kumanovo, and thence into Bulgaria, and S. to Koprülü and Monastir. The city is the headquarters of an army corps, and the see of an Orthodox Greek archbishop, of the archbishop of the Roman Catholic Albanians and of a Bulgarian bishop. Its principal buildings are the citadel, the palace of the vali or provincial governor, the Greek and Bulgarian schools, numerous churches and mosques and a Roman aqueduct. The industries include dyeing, weaving, tanning and the manufacture of metal-work, wine and flour, but Usküb is chiefly important as the commercial centre of the whole vilayet of Kossovo (*q.v.*). The Imperial Ottoman Bank and the Banque de Salonique have branches in the city, and French is to a remarkable extent the language of commerce. Usküb retains in a modified form the name of Scupi, one of the chief cities of northern Macedonia. A few unimportant ruins mark the ancient site, about $1\frac{1}{2}$ m. N.W. Scupi was destroyed by an earthquake in A.D. 518, but was rebuilt by Justinian under the name of Justiniana Prima. Up to the 14th century it was at times the capital of the Servian tsars.

USTARANA, a Pathan tribe who inhabit the outer hills opposite the extreme south portion of Dera Ismail Khan district in the North-West Frontier Province of India. Originally the Ustaranas were entirely a pastoral and trading tribe; but a quarrel with their neighbours, the Musa Khel, put a stop to their annual westward immigration, and they were forced to take to agriculture, and have since acquired a good deal of the plain country below the hills. Their territory includes only the eastern slopes of the Suliman mountains, the crest of the range being held by the Musa Khel, Isots and Zmarais (see Suliman Hills). The Ustaranas are venturesome traders, carrying goods from Kandahar as far as Bengal. They are a fine manly race, quiet and well-behaved, and many of them enlist in the Indian army and police.

USTICA, an island off the N. coast of Sicily, $41\frac{1}{2}$ m. N.N.W. of Palermo. Pop. (1861) 2231; (1901) 1916. It is the Osteodes of the Greeks, but in Roman times was known as Ustica. The island is entirely volcanic and subject to earthquakes, and is fertile. There is a considerable penal colony. There are some Roman tombs excavated in the rock.

USTYUG VELIKIY, a town of Russia, in the government of Vologda, 216 m. N.E. from the city of Vologda, on the navigable Sukhona river, near its confluence with the Yug. Pop. (1885) 8119; (1897) 11,309. It manufactures hosiery, woollens and linens, has sawmills, and carries on an active trade in corn, hemp, flax, bristles and butter, which it exports. It has two important yearly fairs. Its artisans are famous for their jewelry, for engraving upon silver and the fabrication of boxes with secret locks.

USURY. An ancient legal conception, it has been said, corresponds not to one but to several modern conceptions; and the proposition is equally true when economic is substituted for legal. Until quite recent times the term "usury" (Lat. *usura*, use, enjoyment, interest, from *usus*, use) covered a number of essentially different social phenomena. "Thou shalt not lend upon usury to thy brother; usury of money, usury of victuals, usury of anything that is lent upon usury. Unto a stranger thou mayest lend upon usury; but unto thy brother thou shalt not lend upon usury, that the Lord thy God may bless thee" (Deut. xxiii. 19, 20). In this sentence we find interest of all kinds blended together, and the natural economic tendencies directly counteracted by the moral and religious law. At the present day, "usury," if used in the old sense of the term, would embrace a multitude of modes of receiving interest upon capital to which not the slightest moral taint is attached.

The man who does not in some shape or other lend his capital upon "usury" is, in the modern world, generally considered as lacking in his duty to himself or his family. The change in the moral attitude towards usury is perhaps best expressed by saying that in ancient times so much of the lending at interest was associated with cruelty and hardship that all lending was branded as immoral (or all interest was usury in the moral sense), whilst at present so little lending takes place, comparatively, except on commercial principles, that all lending is regarded as free from an immoral taint. This change in the attitude of common-sense morality in respect to "anything that is lent upon usury" is one of the most peculiar and instructive features in the economic progress of society.

"It is worthy of remark," says Grote (*History of Greece*, iii. 144), "that the first borrowers must have been for the most part men driven to this necessity by the pressure of want, and contracting debt as a desperate resource without any fair prospect of ability to pay; debt and famine run together in the mind of the poet Hesiod. The borrower is in this unhappy state rather a distressed man soliciting aid than a solvent man capable of making and fulfilling a contract; and if he cannot find a friend to make a free gift to him in the former character he would not under the latter character obtain a loan from a stranger except by the promise of exorbitant interest and by the fullest eventual power over his person which he is in a position to grant." This remark, though suggested by the state of society in ancient Greece, is largely applicable throughout the world until the close of the early middle ages. Borrowers were not induced to borrow as a rule with the view of employing the capital so obtained at a greater profit, but they were compelled of necessity to borrow as a last resort. The conditions of ancient usury find a graphic illustration in the account of the building of the second temple at Jerusalem (Neh. v. 1–12). The reasons for borrowing are famine and tribute. Some said, "We have mortgaged our lands, vineyards and houses, that we might buy corn, because of the dearth." Others said, "We have borrowed money for the king's tribute, and that upon our lands and vineyards . . . and, lo, we bring into bondage our sons and our daughters to be servants, . . . neither is it in our power to redeem them, for other men have our lands and vineyards." In ancient Greece we find similar examples of the evil effects of usury, and a law of bankruptcy resting on slavery. In Athens about the time of Solon's legislation (594 B.C.) the bulk of the population, who had originally been small proprietors or metayers, became gradually indebted to the rich to such an extent that they were practically slaves. Those who still kept their property nominally were in the position of Irish cottiers: they owed more than they could pay, and stone pillars erected on their land showed the amount of the debts and the names of the lenders. Usury had given all the power of the state to a small plutocracy. The remedy which Solon adopted was of a kind that we are accustomed to consider as purely modern. In the first place, it is true that according to ancient practice he proclaimed a general *seisachtheia*, or shaking off of burdens: he cancelled all the debts made on the security of the land or the person of the debtor. This measure alone would, however, have been of little service had he not at the same time enacted that henceforth no loans could be made on the bodily security of the debtor, and the creditor was confined to a share of the property. The consequence of this simple but effective reform was that Athens was never again disturbed by the agitation of insolvent debtors. Solon left the rate of interest to be determined by free contract, and sometimes the rate was exceedingly high, but none of the evils so generally prevalent in antiquity were experienced.

When we turn to Rome, we find exactly the same difficulties arising, but they were never successfully met. As in Athens in early times, the mass of the people were yeomen, living on their own small estates, and in time they became hopelessly in debt. Accordingly, the legislation of the XII. Tables, about 500 B.C., was intended to strike at the evil by providing a maximum rate of interest. Unfortunately, however, no alteration was made in the law of debt, and the attempt to regulate the rate of interest utterly failed. In the course of two or three centuries the small free farmers were utterly destroyed. By the pressure of war and taxes they were all driven into debt, and debt ended practically, if not technically, in slavery. It would be difficult to overestimate the importance of the influence of usury on the social and economic history of the Roman republic. In the provinces the evils of the system reached a much greater height. In 84 B.C. the war tax imposed by Sulla on the province of Asia was at first advanced by Roman capitalists, and rose within fourteen years to six times its original amount. It is interesting to observe that the old law of debt was not really abolished until the dictatorship of Julius Caesar, who practically adopted the legislation of Solon more than five centuries before; but it was too late then to save the middle class. About this time the rate of interest on first-class security in the city of Rome was only about 4%, whilst in the provinces from 25 to 50% were rates often exacted. Justinian made the accumulation of arrears (*anatocismus*) illegal, and fixed the rate at 6%, except for mercantile loans, in which the rate received was 8%. On the whole, it was truly said of usury during the republic and early years of the empire: "Sed vetus urbi faenebre malum et seditionum discordiarumque creberrima causa." Even when it came to be authorized by Roman law under certain restrictions, it was still looked upon as a pernicious crime. "Cicero mentions that Cato, being asked what he thought of usury, made no other answer to the question than by asking the person who spoke to him what he thought of murder."

It was only natural, considering the evils produced by usury in ancient Greece and Rome, that philosophers should have tried to give an a priori explanation of these abuses. The opinion of Aristotle on the barrenness of money became proverbial, and was quoted with approval throughout the middle ages. This condemnation by the moralists was enforced by the Fathers of the church on the conversion of the empire to Christianity. They held usury up to detestation, and practically made no distinction between interest on equitable moderate terms and what we now term usurious exactions.[1] The consequence of the condemnation of usury by the church was to throw all the dealing in money in the early middle ages into the hands of the Jews. A full account of the mode in which this traffic was conducted in England is given by Madox in chapter vii. of his *History of the Exchequer* (London, 1711). The Jews were considered as deriving all their privileges from the hand of the king, and every privilege was dearly bought. There can be no doubt that they were subjected to most arbitrary exactions. At the same time, however, their dealings were nominally under the supervision of the Jews' exchequer, and a number of regulations were enforced, partly with the view of protecting borrowers and partly that the king might know how much his Jews could afford to pay. It was probably mainly on account of this money-lending that the Jews were so heartily detested and liable to such gross ill-treatment by the people. A curious illustration of this popular animosity is found in the insertion of a clause in the charters granted by Henry III. to Newcastle and Derby, forbidding any Jew to reside in either place. Ultimately in 1290 the Jews were expelled in a body from the kingdom under circumstances of great barbarity, and were not allowed to return until the time of Cromwell. Before the expulsion of the Jews, however, in spite of canonical opposition, Christians had begun to take interest openly; and one of the most interesting examples of the adaptation of the dogmas of the Church of Rome to the social and economic environment is found in the growth of the recognized exceptions to usury. In this respect the canonical writers derived much assistance from the later Roman law. Without entering into technicalities, it may be said generally that an attempt was made to distinguish between usury, in the modern sense of unjust exaction, and interest on capital. Unfortunately, however, the modifications

[1] For a popular account of the reasons given in support of the canonical objections to usury, and of the modifications and exceptions admitted in some quarters, see W. Cunningham's *Usury*.

which were really admitted were not openly and avowedly made by a direct change in the statutes, but for the most part they were effected (as so many early reforms) under the cover of ingenious legal fictions. One of the most curious and instructive results of this treatment has been well brought out by Walter Ross in the introduction to his *Lectures on the Law of Scotland* (1793). He shows, in a very remarkable manner and at considerable length, that "to the devices fallen upon to defeat those laws (*i.e.* against usury) the greatest part of the deeds now in use both in England and Scotland owe their original forms" (i. 4). One of the consequences of this indirect method of reforming the law was that in some cases the evil was much exaggerated. "The judges," says Ross, "could not award interest for the money; that would have been contrary to law, a moral evil, and an oppression of the debtor; but, upon the idea of damages and the failure of the debtor in performance, they unmercifully decreed for double the sum borrowed." He may well remark that imagination itself is incapable of conceiving a higher degree of inconsistency in the affairs of men (compare Blackstone, iii. 434, 435).

In the limits assigned to this article it is impossible to enter further into the history of the question (see also MONEYLENDING), but an attempt may be made to summarize the principal results so far as they bear upon the old controversy, which has again been revived in some quarters, as to the proper relation of law to usury and interest. (1) The opinion of Bentham that the attempt directly to suppress usury (in the modern sense) will only increase the evil is abundantly verified. Mere prohibition under penalties will practically lead to an additional charge as security against risk. The evils must be partly met by the general principles applicable to all contracts (the fitness of the contracting parties, &c.) and partly by provisions for bankruptcy. Peculiar forms of the evil, such as mortgaging to excessive amounts in countries largely occupied by peasant proprietors, may be met by particular measures, as, for example, by forbidding the accumulation of arrears. (2) The attempt to control interest in the commercial sense is both useless and harmful. It is certain to be met by fictitious devices which at the best will cause needless inconvenience to the contracting parties; restraints will be placed on the natural flow of capital, and industry will suffer. (3) In the progress of society borrowing for commercial purposes has gradually become of overwhelming importance compared with borrowing for purposes of necessity, as in earlier times. By far the greater part of the interest now paid in the civilized world is, in the language of the English economists, only a fair reward for risk of loss and for management of capital, and a necessary stimulus to saving.

See *Capital and Interest* (Eng. trans., 1890), by E. Boehm von Bawerk; *Nature of Capital and Income*, by Irving Fisher (1906).

(J. S. N.)

UTAH,[1] one of the Central Western states of the United States of America. It lies between latitudes 37° and 42° N. and between longitudes 32° and 37° W. from Washington (*i.e.* about 109° 1′ 34″ and 114° 1′ 34″ respectively W. of Greenwich). The state is bounded wholly by meridians and parallels, and is bordered on the N. by Idaho and Wyoming, on the E. by Wyoming and Colorado, on the S. by Arizona, and on the W. by Nevada. Utah has an area of 84,990 sq. m., of which 2806 sq. m. are water surface, including Great Salt, Utah and other lakes. The state has a maximum length of 345 m. N. and S., and a maximum width of about 280 m. E. and W.

Physical Features.—The eastern portion of Utah consists of high plateaus, and constitutes a part of the Colorado Plateau province. The remaining western portion of the state is lower, belongs in the Great Basin province, and is characterized by north-south mountain ranges separated by desert basins. The high plateaus consist of great blocks of the earth's crust which are separated from each other by fault-lines, and which have been uplifted to different heights. Erosion has developed deep and sometimes broad valleys along the fault-lines and elsewhere, so that many of the blocks and portions of blocks are isolated from their neighbours. As a rule the blocks have not been greatly tilted or deformed, but consist of nearly horizontal layers of sandstone, shales and limestone. In some cases these sedimentary rocks lie deeply buried under lavas poured out by volcanoes long extinct. The plateau summits rise to elevations of 9000, 10,000 and 11,000 ft., are generally forested, but are too difficult of access to be much inhabited. The people live along the streams in the valleys between the plateaus. In the southern part of the state the high plateaus are terminated by a series of giant terraces which descend to the general level of the Grand Canyon Platform in northern Arizona. The terraces represent the out-cropping edges of hard sandstone layers included in the series of plateau sediments, and are named according to the colour of the rock exposed in the south-facing escarpments, the Pink Cliffs (highest), White Cliffs and Vermilion Cliffs. A still lower terrace, terminating in the Shinarump Cliffs, is less conspicuous; but the higher ones afford magnificent scenery. The northernmost member of the high plateaus is a broad east-west trending arch known as the Uinta Mountains. Local glaciation has carved the higher levels of this range into a maze of amphitheatres containing lakes, separated from each other by *arêtes* and alpine peaks. Among the peaks are King's Peaks (13,498 ft. and 13,496 ft.), the highest points in the state; Mt. Emmons (13,428 ft.); Gilbert Peak (13,422 ft.); Mt. Lovenia (13,250 ft.); and Tokewanna Peak (13,200 ft.). In the south-eastern part of the state are lower desert plateaus, and several mountain groups which do not properly belong to the plateau system. Most interesting among these are the Henry Mountains, formed by the intrusion of molten igneous rock between the layers of sediments, causing the overlying layers to arch up into dome mountains. Stream erosion has dissected these domes far enough to reveal the core of the igneous rock and to give a rugged topography. The highest peaks exceed 11,000 ft. By far the greater part of the high plateau district is drained by the Colorado river and its branches, the most important of which are the Green, Grand and San Juan, portions of whose courses lie in canyons of remarkable grandeur. The western members of the high plateaus drain into the Great Basin for the most part, and in this drainage system the Sevier river is perhaps most prominent. Inasmuch as the streams entering the basin have no outlet to the ocean, their waters disappear by evaporation, either directly from alluvial slopes over which they pass, or from saline lakes occupying depressions between the mountain ranges.

The lower basin portion of Utah is separated from the high plateaus by a series of great fault scarps, by which one descends abruptly to a level of but 5000 or 6000 ft. One of the fault scarps is known as the Hurricane Ledge, and continues as a prominent landmark from a point south of the Grand Canyon in Arizona to the central part of Utah, where it is replaced by other scarps farther east. The floor of the Basin Region is formed of alluvium washed from the high plateaus and mountain ranges, a part of which has accumulated in alluvial fans, and part in the greatly expanded lakes which existed here in the glacial period. This alluvium gives gently sloping or level desert plains, from which isolated mountain ranges rise like islands from the sea. The barren "mud flats," frequently found on the desert floor, result from the drying up of temporary shallow lakes, or playas. Lake Bonneville is the name given to the most important of the much greater lakes of the glacial period, whose old shore-lines are plainly visible on many mountain slopes. Great Salt Lake (*q.v.*) is a shrunken remnant of Lake Bonneville. The mountain ranges of the Basin Region are most frequently formed by faulted and tilted blocks of the earth's crust, which have been carved by stream erosion into rugged shapes. Oquirrh, Tintic, Beaver, House and Mineral Mountains are typical examples of these north-south "basin ranges," which rise abruptly from the desert plains and are themselves partial deserts. The Wasatch Mountain range constitutes the eastern margin of the Great Basin in central and northern Utah, and resembles the true basin ranges in that it is formed by a great block of the earth's crust uptilted along a north-south fault-line. Its steep fault scarp faces west, and rises from 4000 to 6000 ft. above the basin floor; the eastern slope is more gentle, but both slopes are much scored by deep canyons, some of which have been modified in form by ancient glaciers. Among the highest summits are Timpanogos Peak (11,957 ft.), Mt. Nebo (11,887 ft.), Twin Peak (11,563 ft.), and Lone Peak (11,295 ft.). At the western base of the Wasatch are Salt Lake City, Ogden, Provo and other smaller towns, situated where streams issue from the mountains, soon to disappear on the desert plains. In such places agriculture is made possible by irrigation, and the Mormon villages, both here and farther south along the base of the Hurricane Ledge, depend largely on this industry. Important mining operations are carried on in the Wasatch Mountains and in a number of the basin ranges. Mercur, Tintic, Bingham and Park City are well-known mining centres.

Fauna.—In the open country the mule deer, the pronghorn antelope and the coyote are found, and the bison formerly ranged over the north-eastern part of the state; the side-striped ground-squirrel, Townsend's spermophile, the desert pack-rat and the desert pack-rabbit inhabit the flat country. In the mountainous districts and high plateaus are the grizzly, formerly more common, the black bear, the four-striped chipmunk and the yellow-haired

[1] The name is that of a Shoshonean Indian tribe, more commonly called Ute.

porcupine. Various species of small native mice and voles are abundant.

In the marshes of the Salt Lake breed grebes, gulls and terns, and formerly the white pelican. Many ducks breed here, and many others pass through in migration: of the former, the most numerous are mallard and teal; of the latter, pintail, shoveler, scaup, ring-neck ducks, and mergansers. Wood and glossy ibises are commonly seen, and the white ibis breeds in numbers; the sand-hill crane is less common than formerly. A few varieties of shore birds breed here, as the Western willet, the Bartramian sandpiper, and the long-billed curlew. Gambel's partridge is resident in the southern part of the state, and the sage-hen and sharp-tail grouse on the plains. The dusky grouse and grey ruffed grouse are confined to the mountains and plateaus. The California vulture is very rare; various species of hawks and golden and bald eagles are common. The burrowing owl is found on the plains, and various species of small birds are characteristic of the different physical divisions of the state. A few lizards are found in the arid districts. The trout of the Utah mountain streams is considered a distinct species.

Flora.—Western Utah and vast areas along the Colorado river in the east and south-east are practically treeless. The lower plateaus and many of the basin ranges, as well as the basins themselves, are deserts. The higher plateaus, the Uinta and Wasatch mountains, bear forests of fir, spruce and pine, and the lower slopes are dotted with piñon, juniper, and scrub cedar. On the slopes of mountain valleys grow cedars, dwarf maples and occasional oaks. Willows and cottonwoods grow along streams. The west slope of the Wasatch has been largely denuded of its forests to supply the demands of the towns at its base. Among other plants common to the state are the elder, wild hop, dwarf sunflower, and several species of greasewood and cacti. The sagebrush, artemisia, is characteristic of the desert areas. Bunch grass is abundant on the hillsides the year round, and affords valuable pasturage.

Climate.—On account of its great diversity in topography, the state of Utah is characterized by a wide range in climatic conditions. Extremely cold weather may occur on the lofty plateaus and mountain ranges, while the intervening valleys and basins have a milder climate. The mean temperature of the state ranges from 58° in the extreme south to 42° in the north. Winter temperatures as low as 36° below zero are known for the higher altitudes; in the south, summer temperatures of 110° and higher have been recorded. At Salt Lake City the mean winter temperature is 31°, the mean summer temperature 73°. Corresponding figures for St George, in the south-western part of the state, are 38° and 80°. In general Utah may be said to have a true continental climate, although the presence of Great Salt Lake has a modifying effect on the climate of that portion of the Basin Region in which it lies. Killing frosts occur early in September and as late as the last of May, and in the higher valleys they may occur at any time. The mean annual precipitation is only 11 in., the greater part of which occurs in the form of snow in the winter months, summer being the dry season. At Salt Lake City the annual precipitation is 15.8 in., of which 2 in. fall in summer. For St George the figures are: annual precipitation, 6.6 in.; summer, 1.3 in. Both Salt Lake City and St George are near the boundary between the Basin Region and the high plateaus. Well out in the basin deserts the precipitation is still less; and the same holds true for the low desert plateaus in the south-eastern part of the state, where Hite has an annual precipitation of only 2.3 in., of which 0.4 in. falls in the summer. On the other hand, the precipitation on the high plateaus probably exceeds 30 in. in places. In the inhabited parts of the state, irrigation is generally necessary for agriculture.

Soil.—The alluvium of the desert basins furnishes much good soil, which produces abundant crops where irrigated. Alkali soils are also common in the basins, but where water is available they can often be washed out and made productive. Very rich floodplain soils occur along the larger streams. Vast areas of unreclaimable desert exist in the west and south-east. In the protected valleys between the high plateaus alluvial soils are cultivated; but the plateau summits are relatively inaccessible, and, being subject to summer frosts, are not cultivated. Comparatively poor, sandy soil is found on the lower desert plateaus in the south-east, where population is scanty.

Forests.—The forest resources of Utah are of little value: the total wooded area was about 10,000 sq. m. in 1900, or about 12½ % of the land area of the state. The only timber of commercial importance is found in the Uinta Range in the north-eastern corner of the state, and is chiefly yellow pine. The timber of the Wasatch Range is small and scattering. In 1910 there were in the state fourteen national forests varying in size from 1,250,610 acres (the Uinta reserve), 947,490 acres (the Ashley reserve), and 786,080 acres (the Manti reserve), down to the smallest Pocatello (10,720) on the Idaho border. The total area of these reserves was 7,436,327 acres.

Irrigation.—Under the Federal Reclamation Fund, established in 1902, $830,000 was allotted to Utah in 1902–9, and $200,000 more in 1910, for the development of the Strawberry Valley project. This project, which was about one-third completed in the beginning of 1910, provides for the irrigation in Strawberry Valley (Utah and Wasatch counties, S. of Provo), of 60,000 acres, by a 6800-acre reservoir of 110,000 acre-feet capacity, on Strawberry river; by a tunnel, 19,000 ft. long, connecting the reservoir with Diamond Fork, a tributary of Spanish Fork river; by a storage dam, 50 ft. high, of 60,000 cub. yds. contents, diverting water from Spanish Fork river into two canals, one on each side of the river, for the irrigation of land in the valley of Utah lake; by a hydro-electric power plant about 3 m. below the diversion dam; and by the enlargement of existing canal systems. The diversion dam, the power canal, and the first unit of the power plant were completed in 1909. Irrigation of the arid western regions of the United States began in the Great Basin of Utah when the Mormon pioneers in 1847 diverted the waters of City Creek upon the parched soil of Salt Lake Valley. In 1900 nearly 90 % of the land reclaimed by irrigation in the whole state lay within the Great Basin. Between 1889 and 1899 the number of irrigators in the state (exclusive of Indian reservations) increased from 9724 to 17,924, or 84.3 %, and the number of acres irrigated from 263,473 to 629,293, or 138.8 %. In 1900, of the total improved acreage (1,029,226 acres) 61.2 % (629,293 acres) was irrigated; and in 1899, of the 686,374 acres in crops, 537,588 acres, or 78.3 %.

Agriculture.—The number of farms in Utah (not including those of less than 3 acres and of small productivity) in 1880 was 9452; in 1890, 10,517; and in 1900, 19,007: their average size in 1880 was 69.4 acres; in 1890, 125.9 acres; and in 1900, 216.6 acres. The total number of all farms in the state in 1900 was 19,387; and the number of white farmers, 19,144. The greatest number of farms were between 100 acres and 500 acres—1916 in 1880, and 5565 in 1900. Other holdings were as follows: between 20 acres and 50 acres, 3688 in 1880, and 5261 in 1900; between 50 acres and 100 acres, 2056 in 1880 and 3741 in 1900; less than 10 acres, 434 in 1880 and 1622 in 1900; 1000 acres and more, 9 in 1880 and 248 in 1900. The proportion of farms operated by owners decreased from 95.4 % (9019 farms) in 1880 to 91.2 % (17,674 farms) in 1900; those operated by cash tenants increased from 0.6 % (60 farms) in 1880 to 2.6 % (506 farms) in 1900, and those operated by share tenants from 4 % (373 farms) in 1880 to 6.2 % (1207 farms) in 1900. The total area of farms increased from 655,524 acres in 1880 to 4,116,951 acres in 1900, but the proportion of improved land decreased from 63.5 % (416,105 acres) in 1880 to 25.1 % (1,032,117 acres) in 1900, indicating the great increase in land used for grazing.

The value of farm property, including land with improvements, implements and machinery, and live-stock was $19,333,569 in 1880 and $75,175,141 in 1900; the average value per farm was $2045 in 1880 and $3878 in 1900; and the average value per acre of farm land was $29.49 in 1880 and $18.26 in 1900. The value of all farm products was $3,337,410 in 1879 and $16,502,051 in 1899, and the amount expended for fertilizers increased only from $11,394 to $14,300.

In 1899 hay and grain furnished the principal income from 35.4 % of all farms in the state, and live-stock from 28.1 % of all farms. In 1899, 255,699 acres, or 37.3 % of the acreage of all crops, was sown to cereals, which were valued at $2,386,789, or 29 % of the value of all crops. The production of cereals (which grow chiefly in the northern counties of the state) was 130,842 bu. in 1849, 770,287 bu. in 1869, 2,395,744 bu. in 1889, and 5,381,125 bu. in 1899. The principal cereal was wheat, the value of which was $1,575,064 (3,413,470 bu.) in 1899, and $5,481,000 (6,090,000 bu.) in 1909.[1] The value and product of oats in 1899 was $553,847 (1,436,225 bu.), and in 1909, $1,319,000 (2,536,000 bu.); of Indian corn, in 1899, $121,872 (250,020 bu.), and in 1909, $355,000 (408,000 bu.); of barley, in 1899, $121,826 (252,140 bu.), and in 1909, $343,000 (520,000 bu.); of rye in 1899, $13,761 (28,630 bu.), and in 1909, $46,000 (66,000 bu.). The value of the hay and forage crop in 1899 was $3,862,820, or 46.9 % of the value of all crops, and its acreage was 388,043 acres, or 56.5 % of the acreage of all crops; in 1909, the acreage in hay was 375,000 acres, and its value was $9,792,000. Alfalfa (or lucerne) formed the principal part of the hay crop in 1899, and was produced chiefly in the counties of Utah (95,316 tons), Salt Lake (91,266 tons), Cache (64,543 tons) and Boxelder (50,019 tons), all in the northern part of the state.

The vegetable crop in 1899 occupied 24,042 acres, or 3.5 % of the acreage of all crops, and its value was $1,250,713, or 15.2 % of the value of all crops. The product of potatoes increased very rapidly from 519,497 bu. in 1889 to 1,483,570 bu. valued at $487,816 in 1899, and to 2,700,000 bu. valued at $1,161,000 in 1909. The production of other vegetables in 1899 was as follows: water-melons, 620,440; musk-melons, 516,500; tomatoes, 254,052 bu.; cabbages, 997,690 heads, and sweet corn, 16,192 bu. For the important sugar-beet crop, see below under *Manufactures*. On Gunnison and Hat islands in Great Salt Lake are valuable guano deposits which are used as fertilizers for vegetable gardens.

The value of live-stock on farms and ranges in 1890 was $9,914,766; on farms in 1900, $21,474,241. The number of neat cattle in 1900 was 343,690, valued at $7,152,844; on January 1, 1910,[2] 415,000,

[1] 1909 statistics are from the *Year Book* of the U.S. Department of Agriculture.

[2] These 1910 figures for live-stock are taken from the *Year Book* (1909) of the United States Department of Agriculture.

Carl Hentschel Ltd. sc.

valued at $8,976,000, of which 88,000 were milch cows valued at $2,992,000. The number and value of other live-stock were as follows: sheep, in 1900, 3,818,423 ($10,256,488), and on January 1, 1910, 3,177,000 ($13,026,000); horses, in 1900, 115,884 ($3,396,313), and in 1910, 130,000 ($11,050,000); mules, in 1900, 2116 ($58,850), and in 1910, 3000 ($240,000); swine, in 1900, 65,732 ($293,115), and in 1910, 61,000 ($549,000).

The total value of dairy products in 1899 was $1,522,932. The principal products were: milk, in 1890, 8,614,694 gals., and in 1899, 25,124,642 gals. (received from sales, $645,550); butter, in 1890, 1,759,354 ℔ and in 1899, 2,812,122 ℔ (received from sales, $214,910); cheese, in 1890, 163,539 ℔, and in 1899, 169,215 ℔ (received from sales, $122,933). The value of all poultry raised in 1899 was $262,503; the product of eggs was 3,387,340 doz., and their value, $424,628.

The product of wool in 1890 (exclusive of wool shorn after the 1st of June) was 9,685,513 ℔, in 1900, 17,050,977 ℔, and in 1910, 14,850,000 ℔. The value of the honey and wax produced in 1899 was $94,364. Honey was a large crop with the early settlers, who put a hive and honey-bees on the state-seal of Deseret and of Utah.

Mining.—The mineral resources of Utah are varied and valuable, but their development was retarded for many years by the policy of the Mormon Church, which practically forbade its members to do any mining; more recently the development has been slow because of inadequate transportation facilities, and the inaccessibility of some of the deposits. In 1902 the state ranked fourteenth among the states in the value of its mineral products, $12,378,350, and took thirteenth rank in 1907, with a product of $38,099,756, but dropped to the fifteenth rank in 1908, when the total value of its product was $26,422,121.[1] The value of products manufactured from minerals in 1902 was $9,123,228, or 43·1 % of all the manufactures in the state. The relative importance of mining and manufacturing may be shown thus: in 1902 the mines and quarries of the state employed 5712 wage-earners and paid to them $5,089,122, and in 1900 manufacturing industries employed 6615 wage-earners, who received $3,388,370 in wages.

Systematic prospecting for the precious metals did not begin in Utah until 1862, when Colonel Patrick E. Connor (1820–1891) of the Third California Infantry established Camp Douglas near Salt Lake City. He permitted many members of his regiment who had been prospectors in California to prospect the territory, with the result that mines were located at Stockton, Bingham Canyon, Little Cottonwood and elsewhere; but attempts to smelt lead-silver ore near Stockton about 1866 were not successful, and the mining of precious metals did not become an established industry in the Territory until about 1870. Ores of good quality are now known to be quite generally distributed throughout the state. In 1902 the state ranked third in the value of its gold and silver production, $8,500,904; in 1908 it ranked sixth in gold, $3,946,700 (a decrease of $1,174,900 since 1907), and fourth in silver, $4,520,600 (a decrease of $3,007,900 since 1907). In 1908 the richest producers of gold were Salt Lake (60,872·63 oz.), Juab (58,679·17 oz.) and Tooele (41,969·96 oz.) counties, which produced about nine-tenths of the total for the state; in Salt Lake and Juab counties the principal source was copper ore, but in Tooele county almost all the gold was from siliceous ores. For the whole state, of a total of 179,054·60 oz. in 1908, 111,086·12 were from copper ore, 47,439·15 from siliceous ores, and 19,986·36 from lead ores. In the same year the largest producing gold mines were the Centennial Eureka in Juab county, the Mercur in Tooele county, and the Utah Consolidated and the Utah Copper in Salt Lake county. The principal silver regions in 1908 were the Tintic, in Juab and Utah counties, and the Park City, in Summit and Wasatch counties. Of the total production, 8,451,338 oz. (valued at $4,479,209) in 1908, 2,748,289 oz. (of which more than two-thirds was from copper ores) were from Juab county; 2,463,735 oz. (all but 9586 oz., which were from lead zinc ore, being from lead ores) were from Summit and Wasatch counties; 1,561,983 oz. (all from lead ore, except 1158 oz. from copper ore) were from Utah county; 1,125,209 oz. (704,358 from copper ore, 329,276 from lead ore, 47,130 from copper-lead ore and 44,445 from siliceous ore) were from Salt Lake county; and 378,373 oz. (of which 341,375 oz. were from lead ore) were from Tooele county. The principal source of the silver was the lead ores mined, from which in 1908 about two-thirds of the total of the silver was secured.

Far larger in value than either gold or silver, and larger than both together, was the output of copper in Utah in 1907 ($12,851,377) and in 1908 ($11,463,383). Up to 1905 the output of silver in the state was greater than that of copper. In the production of copper in 1908 Utah ranked fourth among the states. Most of the metal was produced in the Bingham, or West Mountain district, Salt Lake county, where there were four mines in 1908 with an output of more than 1,000,000 ℔; the Tintic district in Juab county; the Frisco district in Beaver county; and the Lucin district in Boxelder county. In 1908 more than two-thirds of the total output was from the low-grade porphyry ores mined at Newhouse, Beaver county, and at Bingham, Salt Lake county. There are copper smelters at Garfield, Copperton and Binghamton. An anti-smoke injunction in 1908 closed the furnaces in the immediate vicinity of Salt Lake City. The production of copper in 1883 was 341,885 ℔; in 1890, 1,006,636 ℔; in 1895, 2,184,708 ℔; in 1900, 18,354,726 ℔; in 1904, 46,417,234 ℔; in 1907, 64,256,884 ℔; and in 1908, 81,843,812 ℔.[2]

Third in value (less than copper or silver) in 1908, but usually equalling silver in value, was the state's output of lead. The maximum production, 125,342,836 ℔, was in 1906; in 1908 the output was 88,777,498 ℔ (valued at $3,728,655). The decrease in output and value is largely due to the lower price of lead in the market and the higher smelting rate. In 1908 the following mines produced more than 5,000,000 ℔ each of lead: Silver King at Park City, the Colorado in the Tintic district, the Daly West and the Daly Judge in the Park City district, and the Old Jordan and the Telegraph at Bingham, and there were fifteen other mines that produced between 1,000,000 and 3,000,000 ℔ of lead.

Zinc has been produced in commercial quantities in Summit, Tooele and Beaver counties. In 1906 the output was 6,474,615 ℔, valued at $394,952; in 1908 it was 1,460,554 ℔, valued at $68,646, and almost the entire output was from Summit county.

The apparently inexhaustible supplies of iron ore in southern Utah, and especially in Iron county, had been little worked up to 1910 on account of their inaccessibility. The beds of magnetite and hematite, in the southern portion of the Wasatch Mountains, are the largest in the western United States; in 1902 the four productive mines in Milford, Juab and Utah counties produced 16,240 tons of ore, valued at $27,417. There are valuable manganese deposits in the sandstone of the eastern plateau.

Coal was first discovered in Utah in 1851 along Coal Creek near Cedar City (in what is now Iron county) in the south-western part of Utah, and there was some mining of coal at Wales, Sanpete county, as early as 1855, but there was no general mining until about twenty years later, and the industry was not well established until 1888. Thereafter its development was rapid, and the discovery of outcroppings throughout the central and southern parts of the state gave evidence of the existence of great bodies of the mineral. The only important region of coal mining in the state up to 1910 was in Carson county, where more than nine-tenths of the total output of the state was mined in 1907 and in 1908. The production in 1870 was 5800 tons; in 1880, 14,748 tons (probably an under-estimate); in 1890, 318,159 tons; in 1900, 1,147,027 tons; in 1903, 1,681,409 tons; in 1907, 1,947,607 tons (the maximum); and in 1908, 1,846,792 tons. The total production from 1870 to 1908 was 20,683,974 tons, or allowing for coal lost, about 31,000,000 tons, which is estimated to represent 0·016 % of the original supply. In 1909 the United States Geological Survey reported workable beds of coal aggregating 13,130 sq. m. in area, and 2000 sq. m. more in which it seemed probable that coal might be found. The shales of Utah, Sanpete, Juab and San Juan counties may furnish a valuable supply of petroleum if transportation facilities are improved; and there are rich supplies of asphalt—19,033 tons (valued at $100,324) was the output for 1908.

Salt is obtained by solar evaporation chiefly of the waters of Great Salt Lake and other brine found in that vicinity; at Nephi City, Juab county; near Gunnison, Sanpete county; in Sevier and Millard counties, and at Withee Junction in Weber county. The value of this product in 1907 was $199,779 (345,557 bbls.), and in 1908, $169,833 (242,678 bbls.).

Of other non-metallic products, among the most important were limestone—valued in 1902 at $186,663, and in 1908 at $253,088—and sandstone—valued in 1902 at $105,011 and in 1908 at $25,097. Some marble is quarried at Beaver in Beaver county, and Utah onyx has been used for interior decoration, notably in the city and county building of Salt Lake City. The clay products of the state in the same year were valued at $658,517. There are considerable deposits of sulphur, of varying degrees of richness, near Black Rock in Beaver county. Many semi-precious and precious stones are found in Utah, including garnet (long sold to tourists by the Navaho Indians), amethyst, jasper, topaz, tourmaline, opal, variscite (or "Utahlite"), malachite, diopside and Smithsonite. In 1908 the reported value of precious stones from Utah was $20,350.

Manufactures.—The manufacturing industry was long comparatively unimportant, being largely for local markets. It is still largely dependent on local raw material. But, with the growth of the mineral industry and of the cultivation of sugar beets, there was a remarkable growth in manufacturing between 1900 and 1905: the amount of capital increased from $13,219,039 to $26,004,011, or 96·7 %; the average number of wage-earners from 5413 to 8052, or 48·8; and the value of factory products from $17,981,648 to $38,926,464, or 116·5 %. In the period under

[1] The 1907 and 1908 statistics are from the *Mineral Resources of the United States*, published by the United States Geological Survey.

[2] These statistics for 1904, 1907 and 1908 are from *Mineral Resources of the United States for 1908*.

discussion, urban establishments (*i.e.* those in the two municipalities—Salt Lake City and Ogden—having a population in 1900 of at least 8000), increased in number from 205 to 256 or 24·9%, and rural establishments decreased in number from 370 to 350 (5·4%); the capitalization of urban establishments increased from $4,212,972 to $7,700,750 (82·8%), and that of the rural from $9,006,067 to $18,303,361 (103·2%); the average number of wage-earners in urban establishments increased from 2832 to 3859 (36·3%), and those in rural establishments from 2581 to 4193 (62·5%); the value of the products of urban establishments increased from $5,521,140 to $10,541,040 (90·9%) and that of rural establishments from $12,460,508 to $28,385,424 (127·8%). This unusual predominance of rural over urban manufacturing is further shown by the fact that in 1900, 64·3% of the establishments reporting, and 69·3% of the value of their products were from factories classified as rural, and in 1905 the proportion of rural factories was 58·8%, and the value of their products 72·9% of the total. This predominance was largely due to the smelting and refining industry, the smelters being chiefly in the rural districts.

The flour and grist mill industry was the most important in the state, with products valued at $1,659,223 in 1900, and $2,425,791 in 1905. The values of the products of other industries in 1900 and 1905, in the order of their importance, were as follows: Car and general shop construction and repairs by steam railway companies, in 1900, $1,306,591, and in 1905, $1,886,651; printing and publishing, in 1900, $770,848, and in 1905, $1,466,549; confectionery, in 1900, $403,379, and in 1905, $1,004,601; canning and preserving fruit and vegetables in 1900, $300,349, and in 1905, $801,958. The value of the products of industries of lesser importance in 1905 were: slaughtering and meat packing (wholesale), $653,314; malt liquors, $636,688; and foundry and machine shop products, $587,484.

The beet sugar industry is one of growing importance in Utah: there were in 1900 3 refineries, having a daily total capacity of 1100 tons of beets; in 1905, 4, with a daily total capacity of 2850 tons; and in 1909,[1] 5, which treated 455,064 tons of beets and produced 48,884 tons of sugar. In 1853 a sugar factory bought in England was erected at Provo, but no sugar was manufactured there, and none was successfully refined until 1889. Sugar beets were first grown by irrigation in Utah; under that system it becomes possible to estimate closely the tonnage of the product. Slicing stations established at distances of from 12 to 25 m. from a factory receive the beets, extract the juice and force it through pipes to the factory.

Transportation.—The first trade route to be established by white men within the present boundaries of Utah was the old Spanish trail from Santa Fé to Los Angeles. The trail entered what is now Utah, just east of the Dolores river, crossed the Grand river near the Sierra La Salle and the Green river at the present crossing of the Denver & Rio Grande railway, proceeded thence to the Sevier river and southward along its valley to the headwaters of the Virgin river, which it followed southward, and then westward, so that its line left the present state near its south-west corner. The presence of this and other trails to California was of great importance during the gold excitement of 1849, when many miners outfitted at Salt Lake City and the Mormons grew rich in this business. The first considerable railway enterprise in the territory was the Union Pacific, which was completed to Ogden in 1869. This system (which includes the Oregon Short line) has since been supplemented by the Denver & Rio Grande, the Southern Pacific, the San Pedro, Los Angeles & Salt Lake, and various connecting lines. The railway mileage in 1870 was 257 m.; in 1890, 1265 m.; and in 1909, 1962·87 m.

Population.—The population in 1850 was 11,380; in 1860, 40,273; in 1870, 86,786; in 1880, 143,963; in 1890, 207,905; in 1900, 276,749; and in 1910, 373,351. Of the population in 1900, 219,661 were native whites, 53,777, or 19·4%, were foreign-born, 2623 were Indians (of whom 1472 were not taxed), 672 were negroes, 572 were Chinese and 417 were Japanese. The reservation Indians in 1909 were chiefly members of the Uinta, Uncompahgre and White River Ute tribes on the Uinta Valley reservation (179,194 acres unallotted) in the north-eastern part of the state.[2] Of the 1900 native-born population 3870 were born in Illinois, 3032 in New York, 2525 in Ohio and 2519 in Pennsylvania. Of the foreign-born by far the largest number, 18,879, were natives of England, 9132 were Danes, 7025 were Swedes; and natives of Scotland, Germany, Wales and Norway were next in numbers. The large English immigration is to be ascribed to the successful proselytizing efforts of the Mormons in England. The same influence may be traced in the other immigration figures. There was, however, a relative decrease in the number of foreign-born in the state from 1890 to 1900. Of the total 1900 population 169,473 were of foreign parentage (*i.e.* either one or both parents were foreign-born), and 42,735 were of English, 18,963 of Danish and 12,047 of Swedish parentage, both on the father's and on the mother's side. The Latter-Day Saints (Mormons) are far more numerous than any other sect, this church having a membership in 1906 of 151,525 (of these 493 were of the Reorganized Church of Jesus Christ of Latter-Day Saints) out of a total of 172,814 in all denominations; there were 479 members of this denomination to every 1000 of the population in the state, and the next largest sect, the Roman Catholics, had only 26 per 1000 of population and no Protestant body more than 6 per 1000. In the same year there were 8356 Roman Catholics, 1902 members of the Northern Presbyterian Church, 1537 members of the Northern Methodist Episcopal Church, 1174 Congregationalists, and 987 Baptists (of the Northern Conference). The state in 1900 had 3·4 inhabitants to the sq. m. While this approached the average—3·5 for all the states west of the Rocky Mountains taken together, with the exception of Colorado, which had 5·2—it was noticeably higher than that of its immediate neighbours, Idaho (1·9), Arizona (1·1) and Nevada (0·4). At the census of 1880 the density of the population was 1·8 and in 1890 it was 2·6. From 1890 to 1900 the urban population (*i.e.* the population of places having 4000 inhabitants or more) increased from 69,456 to 81,480, or 17·3%, the urban population in 1900 being 29·4% of the total; the semi-urban population (*i.e.* population of incorporated places, or the approximate equivalent, having less than 4000 inhabitants) increased from 36,867 to 83,740, 71·1% of the total increase in population; while the rural population (*i.e.* population outside of incorporated places) increased from 104,456 to 111,529, 10·7% of the total increase. The principal cities of the state are: the capital, Salt Lake City, pop. (1910) 92,777; Ogden, 25,580; Provo, 8925; and Logan, 7522.

Administration.—The state is governed under the first constitution adopted on the 5th of November 1895, and amended in November 1900, November 1906, and November 1908. An amendment may be submitted to the people at the next general election by a two-thirds vote of the members elected to each house of the legislature, and only a majority of the electors voting thereon is required for approval. By a two-thirds majority the legislature may recommend that a constitutional convention be called; and if a majority of the electors at the next general election approve, the legislature shall provide for the convention, but the approval of a majority of the electors voting is necessary for ratification of the work of the convention. Article III., which guarantees religious freedom, forbids sectarian control of public schools, prohibits polygamy and defines the relation of the state to the public lands of the United States, is irrevocable except by consent of the United States. Every citizen of the United States, male or female, twenty-one years old or over, who has lived one year within the state, four months within the county and sixty days within the precinct has the right of suffrage, except that idiots, insane, and those convicted of treason or crime against the elective franchise are disfranchised; but in elections levying a special tax, creating indebtedness or increasing the rate of state taxation, only those who have paid a property tax during the preceding year may vote. A form of the Australian ballot with party columns is provided at public expense. As in so many of the newer Western states, the constitution specifies minutely many details which in the older instruments are left to be fixed by statute. For example, the employment of women or of children under fourteen in mines and the leasing of convict labour by contract are forbidden, and eight hours must constitute a day's work in state, county or municipal undertakings.

Executive.—The executive department consists of the governor, secretary of state, auditor, treasurer, attorney-general and superintendent of public instruction, all elected by the people at the time of the presidential election, and

[1] *Year Book* of the United States Department of Agriculture.

[2] The *Report* of the commissioner of Indian Affairs for 1909 gives the following figures for the Indian population: under the Panguitch School, Kanab Kaibab, 81, Shivwitz Paiute, 118; under the Uinta and Puray Agency, Uinta Ute, 443, Uncompahgre Ute, 469, White River Ute, 296; not under agency, Paiute 370.

holding office for four years from the first day of January following. All these officers must be qualified electors and must have resided within the state for five years preceding their election. The auditor and treasurer may not succeed themselves, and governor and secretary of state must be at least thirty years old. The governor may call the legislature in extraordinary session or may summon the Senate alone. With the consent of the Senate he appoints all officers whose election or appointment is not otherwise provided for, including the bank examiner, state chemist, dairy and food commissioners, the boards of labour and health, the directors of the state institutions, &c., and fills all vacancies in elective offices until new officers are chosen and qualified. The governor, justices of the supreme court and the attorney-general constitute a board of pardons. The governor and other state officers form other boards, but the legislature is given power to establish special boards of directors. The veto of the governor, which extends to separate items in appropriation bills, can be overcome only by a two-thirds vote of each house of the legislature; but if the bill is not returned to the legislature, within five days it becomes a law without the governor's approval. The governor may not be elected to the United States Senate during his gubernatorial term.

Legislative.—The legislative power is vested in (1) the legislature, consisting of the Senate and House of Representatives, and (2) in the people of Utah. The legislature meets biennially on the second Monday in January of the odd-numbered years. No person is eligible to either house who is not a citizen of the United States, twenty-five years of age, a resident of the state for three years and of the district from which he is chosen for one year. Senators are elected for four years, but one-half the membership of the Senate retires every two years. The representatives are elected for two years. No person who holds any office of profit or trust under the state or the United States is eligible to the legislature, and no member, during the term for which he was chosen, shall be appointed or elected to any office created, or the emoluments of which have been increased during his term. Each house is the judge of the election and qualification of its own members. The membership of each house is fixed by law every five years, but the number of senators must never exceed thirty, and the number of representatives must never be less than twice nor more than three times the number of senators. In 1909 the Senate had eighteen and the House forty-five members. The legislature is forbidden to pass any special act where a general law can be made applicable, and is specifically forbidden to pass special acts on a number of subjects, including divorce, the rate of interest, and the incorporation of cities, towns or villages, or the amendment of their charters, &c. Neither the state nor any political subdivision may lend its credit or subscribe to the stock of any private corporation. The powers of the houses are the same, except that the Senate confirms or rejects the governor's nominations and sits as an impeachment court, while the Representatives initiate impeachments. By an amendment of 1900, the legislature was instructed to provide that a fixed fraction of the voters might cause any law to be submitted to the people, or that they might require any legislative act (except one passed by a two-thirds vote of each house) to be so submitted before going into effect, but up to 1910 no law had been passed putting the amendment into force.

Judiciary.—The judicial power is vested in the Senate sitting as a court of impeachment, in the Supreme Court, the district courts, in justices of the peace, and in "such inferior courts as may be established by law." The Supreme Court is composed of three justices (but the number may be increased to five whenever the legislature shall deem it expedient) each of whom must be thirty years old, learned in the law, and a resident of the state for five years preceding his election. They are elected by the people for a term of six years, but the term of one expires every two years, and that justice who shall have the shortest time to serve acts as chief justice. The court has original jurisdiction to issue writs of *mandamus*, *certiorari*, prohibition, *quo warranto* and *habeas corpus*. Otherwise its jurisdiction is exclusively appellate, and every final decision of a district court is subject to review. The court holds three terms yearly in the capital. The state is divided into seven districts, in which from one to four judges are elected for terms of four years. They must be twenty-five years old, residents of the state for three years, and of the district in which they are chosen. They have original jurisdiction of civil, criminal and probate matters, not specifically assigned to other tribunals, and appellate jurisdiction from the inferior courts. At least three terms yearly must be held in each county. In cities of the second class (5000–30,000 inhabitants) municipal courts may be established. In cities of the first class (30,000 or more) a city court was established in 1901. Special juvenile courts may be established in cities of the first and second class. Each precinct elects a justice of the peace, who has civil jurisdiction when the debt or damage claimed does not exceed three hundred dollars, and has primary criminal jurisdiction.

Local Government.—The county is the unit of local government. The chief fiscal and police authority is the Board of County Commissioners of three members, two elected every two years, one for two years and one for four. They create and alter subdivisions, levy taxes, care for the poor, construct, maintain and make regulations for roads and bridges, erect and care for public buildings, grant franchises, issue licences, supervise county officers, make and enforce proper police regulations (but the authority does not extend to incorporated towns or cities), and perform such other duties as may be authorized by law. Other county officers are the clerk (who is *ex officio* clerk of the district court and of the commissioners), sheriff, treasurer, auditor, recorder, surveyor, assessor, attorney and superintendent of district schools, but where the assessed valuation of any county is less than $20,000,000 the clerk is *ex officio* auditor, and the commissioners may consolidate offices. The precincts are laid off by the commissioners and each elects a justice of the peace and a constable. Cities are divided into classes (see above) according to population, and are governed by a mayor and a council. In cities of the first class fifteen, and of the second ten, councilmen are elected by wards, while in cities of the third class (all having less than 5000 inhabitants) five councilmen are elected on a general ticket.

Miscellaneous Laws.—Men and women may hold and dispose of property on the same terms, except that a husband cannot devise more than two-thirds of real estate away from his wife without her consent, and that a woman attains her majority at eighteen or when she marries. The property of an intestate leaving a widow or widower, but no issue, goes to the survivor if not over $5000 in value; if over that amount, one-half the excess goes to the survivor and one-half to the father and mother of the deceased or to either of them. If neither father nor mother survives, their share goes to the brothers and sisters of the deceased or to their descendants. If there are no descendants, the whole goes to the surviving husband or wife. If a husband or wife and one child survive, they share the estate equally; if more than one child, the surviving husband or wife takes one-third and the children divide the remainder. If the intestate leaves issue but no husband or wife, the issue takes the whole. Failing all these, the estate goes to the next of kin. An illegitimate child is an heir of its mother and of the person who acknowledges himself to be its father. Estates exceeding $10,000 pay an inheritance tax of 5% on the excess. A homestead not exceeding $1500 for the head of the family and $500 additional for the husband or wife and $250 additional for each other member of the family is not subject to execution except for the purchase price, or mechanic's and labourer's liens, lawful mortgage or taxes. The district courts have exclusive jurisdiction in divorce, which may be granted because of impotency at time of marriage, adultery, wilful desertion for more than one year, wilful neglect to provide the necessities of life, habitual drunkenness, conviction for felony, intolerable cruelty, and permanent insanity which has existed for at least five years. An interlocutory decree is entered which becomes absolute at the end of six months, unless appeal is entered. The guilty party forfeits all rights acquired through marriage. Children over ten years of age may select the parent to whom they will attach themselves. A marriage may be annulled on ground of idiocy, insanity, bigamy, loathsome disease at time of marriage, epilepsy, miscegenation (white and negro or white and Mongolian), or when a male is less than sixteen or a female less than fourteen years of age. A marriage licence is required. No female and no male under fourteen may work in a mine. Eight hours is the limit of a day's work in mines and smelters. A person sentenced to death may choose one of two methods of execution—hanging or shooting.

Education.—Before 1890 some districts in the state under a local option law had established free schools, but the general free school system was founded in 1890 by a law which consolidated all the districts in each city into one large school district and classified Salt Lake City as a city of the first class, and Ogden, Logan and

Provo as cities of the second class for school purposes; in 1908–9 six county school districts of the first class were formed. In 1892–1893 text-books and supplies were first furnished free to pupils in the grades; and in the same year supervisory work was introduced. At the head of the public school system is a state superintendent of public instruction, elected for four years, and a board of education, composed of the state superintendent, the president of the state university, the president of the Agricultural College, and two appointees of the governor serving for four years. There is a county superintendent whose term is two years. And in each district there is a board of three trustees, one retiring each year. Two or more contiguous districts may unite to form a high school district. School attendance is compulsory for twenty weeks each year in rural districts and for thirty weeks each year in cities of the first and second class for all children between eight and sixteen years. In 1900 the percentage of illiterates at least ten years old was 3·1. In 1909 there were 685 public schools in the state; the total number of pupils of school age (six to eighteen years) was 102,050, the number enrolled in the public schools was 84,804, and the average daily attendance was 66,774; the total number of teachers was 2255 (1645 women), and the average monthly salary of men teachers was $88·13 and of women $57·44; and the total expenditure for public education was $2,762,581 for the year, being more than twice as much as was expended by the state ten years before. The laws of the state provide for a commission, in cities and counties, for the retirement of public school teachers on a pension. The university of Utah at Salt Lake City was opened in 1850 as the state university of the "state of Deseret." The State Agricultural College and Experiment Station (1888) is at Logan. At Cedar City, in Iron county, is a branch normal school, connected with the state university. There is a state school for the deaf and the blind (1884) at Ogden. The Art Institute at Salt Lake City has an annual art exhibit, a state art collection, and a course of public lectures on art. There is a state commission which promotes the establishment of free libraries and gymnasiums. The Mormons control Brigham Young University (1876) at Provo, Brigham Young College (1878) at Logan, the Latter-day Saints University (1887) at Salt Lake City, and academies at Ogden, Ephraim, Castle Dale, Beaver and Vernal. Other denominational schools are: St Mary's Academy (1875; Roman Catholic) in Salt Lake City; All Hallows College (1886; Roman Catholic) in Salt Lake City; Westminster College (1897; Presbyterian) in Salt Lake City, and Presbyterian academies at Logan, Springville and Mt. Pleasant; Rowland Hall Academy (1880; Protestant Episcopal) for girls at Salt Lake City; and Gordon Academy (1870; Congregational) at Salt Lake City.

Charitable and Penal Institutions.—The state supports a Mental Hospital (1884, with provision for feeble-minded and non-insane epileptics since 1907) at Provo, a state Industrial School (1889) at Ogden and a state prison (1850) at Salt Lake City. Under a law of 1905, amended in 1907 and 1909, provision is made for separate juvenile courts in all districts in which there are cities of the first (Salt Lake City) or the second class (Ogden, Logan and Provo) with jurisdiction over children under eighteen years of age; and similar jurisdiction is given to district courts elsewhere. In connexion with the juvenile court detention homes have been established, and in certain conditions justices of the peace are empowered to act as judges of the juvenile court in their respective precincts. There are many denominational charities, especially Mormon, the entire state being divided into ecclesiastical units or "stakes" for charity organization.

Finance.—The principal source of public revenue is the property tax. An amendment of 1908 provides for the taxation of mines and mining property. The state assumed the Territorial debt of $700,000, and has added to it a bonded indebtedness of $200,000; the bonds, formerly 5%, have been refunded at 3½ and 3%. There were only private banks until 1872, when Brigham Young organized a national bank. The first savings bank was organized in 1873, and state banks now outnumber national banks. The banking business for many years was largely in the hands of high Mormon officials, and the loyalty of church members built up a remarkable financial confidence, so that no Utah banks failed even in the panic of 1893.

History.—Existing documents seem to indicate that Francisco Vasquez de Coronado, the Spanish explorer, sent out an expedition of twelve men under Captain Garcia Lopez de Cardenas in 1540, which succeeded in reaching the Colorado river at a point now within the state of Utah. But more extended exploration was conducted by two Franciscan friars, Francisco Atanasio Dominguez and Silvestre Velez de Escalante, who, on the 29th of July 1776, left Santa Fé with seven others to discover a direct route to Monterey on the coast of Alta California. This party came in sight of Utah lake on the 23rd of August. Almost half a century later, in the winter of 1824–25, James Bridger, a trapper, discovered the Great Salt Lake while seeking the source of the Bear river. Many trappers in their skin boats followed his lead, notably William H. Ashley, of the Rocky Mountain Fur Company, who, in 1825, at the head of about 120 men and a train of horses, left St Louis and established the fort named for him at Lake Utah. In 1843 General John C. Frémont with Kit Carson and three others explored the Great Salt Lake in a rubber boat. With Brigham Young and his little band of Mormon followers (between 140 and 150 members), who entered the Great Salt Lake Valley in July 1847, begins the story of settlement and civilization (see MORMONS). Before the end of 1848 about 5000 Mormons had settled in the Salt Lake Valley. The treaty of Guadalupe Hidalgo (Feb. 2, 1848) ceded to the United States the vast western territory which included Utah. Early in 1849 the Mormon community was organized as the state of Deseret[1] with Brigham Young as governor. Deseret then comprised not only the present state of Utah, but all Arizona and Nevada, together with parts of New Mexico, Colorado, Wyoming and California. Application was made to Congress to admit it as a state or Territory, and on the 9th of September 1850 the Territory of Utah, then comprising the present state and portions of Nevada, Colorado and Wyoming, was established under an Act, which provided that it should be admitted as a state, with or without slavery, as the constitution adopted at the time of admission prescribed. (See COMPROMISE OF 1850.) The Republican party and (less violently) the Democratic in their national platforms and in Congress attacked and opposed the Mormon institution of polygamy. Statehood, therefore, was not granted until the 4th of January 1896, owing to the apparent hostility of the Mormon authorities to non-Mormon settlers and to repeated clashes between the Mormon Church and the United States government regarding extent of control, polygamous practices, &c. And even after the admission of the state these questions arose in the matter of seating prominent Mormons who were elected to Congress. For a detailed account of these difficulties and of the growth of the "Gentile" or non-Mormon element see the article MORMONS.

Through irrigation experiments agriculture became the industrial foundation of the desert community. The waters of City Creek were at first diverted and a canal was built; and the results were encouraging, though in the summer of 1848 crops were destroyed by a swarm of black crickets; but in turn this pest was devoured by sea-gulls, and the phrase "gulls and crickets" has become one of peculiar historic significance in Utah. After 1849 the gold-fever horde bound for California furnished a source of revenue to the Mormons, as their settlement afforded an admirable post for supplies.

The division of land among the Mormons was singularly equitable. Each city block consisted of 10 acres divided into eight 1¼-acre lots, which were assigned to professional and business men. Then a tier of 5-acre lots was apportioned to mechanics, and 10- and 20-acre parcels of land were given to farmers, according to the size of their families. As Great Salt Lake City grew all landholders benefited, either by the location of their property or because of its size, the smaller lots being closer to the business centre and the larger tracts being in the outlying districts.

In 1847 Brigham Young had succeeded Joseph Smith as president of the Mormons, and he held that position of veritable dictator until his death (1877); John Taylor succeeded him, and Wilford Woodruff in 1890 was chosen head of the organization; then Lorenzo Snow was president in 1898–1901, and Joseph Fielding Smith was elected in 1901.

From time to time the Indians have risen against the Mormons. Between 1857 and 1862 outbreaks were frequent, and on the 29th of January 1863 occurred the battle of Bear river, where some 300 Shoshones and Bannocks and about 200 of Colonel P. E. Connor's command participated in a bloody engagement. In April 1865 an Indian war broke out under the leadership of Blackhawk, which lasted intermittently until the end of 1867. But in June 1865 treaties were concluded with the majority

[1] According to the Book of Mormon, "Deseret" means "land of the working bee."

of Utah tribes, whereby they agreed to remove to Uinta Valley, where a reservation had been made for them. One other important reservation, the Uncompahgre, has also been opened for the Indians of the state.

The state has chosen Republican governors and, except in 1896, when it gave its electoral vote to W. J. Bryan, the Democratic candidate for the presidency, has voted for the Republican nominees in presidential elections.

GOVERNORS

State of Deseret

Brigham Young	1849–1850

Territorial

Brigham Young	1850–1857
Alfred Cumming	1857–1861
John W. Dawson	1861
Frank Fuller (Acting Governor)	1861–1862
Stephen S. Harding	1862–1863
James Duane Doty	1863–1865
Charles Durkee.	1865–1869
Edwin Higgins (Acting Governor)	1869–1870
S. A. Mann (Acting Governor).	1870
J. Wilson Schaffer	1870
Vernon H. Vaughan (Acting Governor)	1870–1871
George L. Woods	1871–1874
S. B. Axtell	1874–1875
George B. Emery	1875–1880
Eli H. Murray	1880–1886
Caleb W. West	1886–1889
Arthur L. Thomas	1889–1893
Caleb W. West	1893–1896

STATE GOVERNORS

Heber M. Wells (Republican)	1896–1905
John C. Cutler (Republican)	1905–1909
William Spry (Republican)	1909–

Powell, *Geology of the Uinta Mountains* (ibid., 1876), *Exploration of the Colorado River of the West* (ibid., 1875), and *The Lands of Utah* (ibid., 1879); W. M. Davis, "An Excursion to the Plateau Province of Utah and Arizona" and "The Mountain Ranges of the Great Basin," in vol. 42 (1903) of *Bulletin* of the Harvard Museum of Comparative Zoology; S. F. Emmons, "Uinta Mountains," in vol. 18 (1907) of the *Bulletin* of the Geological Society of America; C. E. Dutton, *The High Plateaus of Utah* (Washington, 1880); and G. K. Gilbert, Lake Bonneville (ibid., 1890), Monograph I. of the U.S. Geological Survey. On mineral wealth see Nichols, *Mineral Resources of Utah* (Pittsburg, 1873). For administration see James T. Hammond and Grant H. Smith (edd.), *Compiled Laws of the State* (Salt Lake City, 1908). The important titles for the history of the state are those given in the article MORMONS, especially H. H. Bancroft, *History of Utah* (San Francisco, 1889), and O. F. Whitney, *History of Utah* (4 vols., Salt Lake City, 1892–98).

UTAMARO (1754–1806), one of the best known of the Japanese designers of colour-prints, was born at Kawayoye. His father was a well-known painter of the Kanō School, Toriyama Sekiyen (Toyofusa), a pupil of Kanō Chikanobu; and Utamaro traced his descent from the old feudal clans of the Minamoto, whose war with the Taira family belongs to the romantic period of Japanese history. Utamaro's personal name was Yusuke; and he first worked under the signature Toriyama Toyo-aki; but after a quarrel with his father substituted the name Kitagawa for the former appellation. His distinct style was the outcome of that of his father, tempered with the characteristics of the Kanō school. As a painter, his landscapes and drawings of insects are most highly considered by Japanese critics; but his fame will always rest among Europeans on his designs for colour-prints, the subjects of which are almost entirely women—professional beauties and the like. These were done for the most part while he lived, in a sort of bondage, in the house of a publisher, Tsutaya Shigesaburo. His talents were wasted by an unbroken career of dissipation, culminating in a term of imprisonment for a pictorial libel on the shogun Iyenari, in 1804. From this he never recovered, and died on the third day of the fifth month, 1806. The colour-prints of Utamaro are distinguished by an extreme grace of line and of colour. His composition is superb; and even in his lifetime he achieved such popularity among his contemporaries as to gain the title Ukiyo-ye Chūkō-no-so, "great master of the Popular School." His work has a considerable reputation with the Dutch who visited Nagasaki, and was imported into Europe before the end of the 18th century. His book illustrations are also of great beauty. Three portraits of him are known: two colour-prints by himself, and one painting by Chobunsai Yeishi (in the collection of Mr Arthur Morrison). His prints were frequently copied by his contemporaries, especially by the first Toyokuni and by Shunsen; and many of those bearing his name are really the work of Koikawa Harumachi, who had been a fellow-student, and afterwards married his widow. That artist is known by the name of Utamaro II. Most of these imitations were made between 1808 and 1820. Utamaro II., who afterwards changed his name to Kitagawa Tetsugorō, died between 1830 and 1843.

See E. de Goncourt, *Outamaro* (1891); E. F. Strange, *Japanese Illustration* (1897); and Japanese Colour-Prints (Victoria and Albert Museum *Handbook*, 1904). (E. F. S.)

UTE, or UTAH, a tribe of North American Indians of Shoshonean stock. They originally ranged over central and western Colorado and north-eastern Utah. They were divided into five sub-tribes, all acknowledging the authority of one chief. They were a wild warlike people, constantly fighting the Plain Indians and raiding as far south as New Mexico. Their relations with the whites have been generally friendly. The outbreak of the White River Band in 1879 is almost the only exception. They are now on reservations in Utah and Colorado, and number over 2000.

UTICA, a city of ancient Africa on the *sinus Uticensis*, 15½ m. N.W. of Carthage and Tunis, on the route from Carthage to Hippo Diarrhytus (Bizerta) and Hippo Regius (Bona). The modern marabout of Sidi Bu Shater, at the foot of Jebel Menzel el Gul, occupies the site of the ruins of Utica, which in ancient times stood at the mouth of the Bagradas (Mejerda). The mouth of the river is now 12 m. to the north, owing to alluvial deposits, and the level of the ancient town is covered with low-lying meadows, pools of water and marshes. The name *Utica* is of uncertain origin; the coins give the form אתק (*Atag, Ätig*); it is therefore with justification that Movers, Tissot and other scholars have suggested a form עתיקא (*Atiqa*) meaning "the ancient" or "the magnificent," or *Statio nautarum* (Movers, *Die Phönizier*, ii. 2nd part, p. 512; Olshausen in *Rheinisches Museum*, 1853, p. 329; Tissot, *Géogr. comp. de l'anc. prov. d'Afrique*, ii. p. 58). The Greeks transliterated the Punic name as Ἰτύκη, Οὐτίκη, Οὐτίκα and the Romans by *Utica*. According to tradition, Utica was one of the oldest Phoenician settlements on the African coast, founded three centuries before Carthage. It soon acquired importance as a commercial centre, and was only partially eclipsed by Carthage itself, of which it was always jealous, though it had to submit to its authority. It is mentioned in the commercial treaty of 348 B.C. between Rome and Carthage (Polyb. iii. 24). Agathocles easily captured it in his expedition to Africa in 310. It remained faithful to Caesar during the First Punic War (Polyb. i. 82), but soon withdrew its support in view of the revolt of the Mercenaries. In the Third Punic War it declared for the Romans (Livy, *Epit.* xlix.; Polyb. xxxvi. 1; Appian viii. 75). After the destruction of Carthage it received the rank of a *civitas libera* with an accession of territory (Appian viii. 135; *C.I.L.* i. 200; Caesar, *De bell. civ.* ii. 36; A. Audollent, *Carthage romaine*, p. 30). Having become the city of an administration of the new Roman province up to the time of the rebuilding of Carthage, it played an important part in the wars at the end of the Republic. After the battle of Thapsus in 46 Cato shut himself up in Utica for the final struggle against Caesar, and there committed suicide. Augustus gave the town the rank of *municipium* with full civic rights (Dio Cass. xlix. 16; Pliny, *Hist. nat.* v. 4, 24); its inhabitants were enrolled in the Quirinal tribe (*municipium Julium Uticense*). Under Hadrian it became a *colonia romana*, with the title *Colonia Julia Aelia Hadriana Augusta Utica* (Aul. Gell. *Noct. Attic.* xiii. 4; *C.I.L.* viii. 1181 and 1183).

Septimius Severus conferred upon it the *Ius Italicum* (*Digest.* 50. 15; 8. 11).

We find evidence of the African Church at Utica as early as at Carthage; it was the seat of a bishop and had its martyrs from the 3rd century onwards. But its harbour was beginning to silt; the *Stadiasmus Maris Magni* (cxxvi.) states that already it was no longer a harbour but merely an anchorage. It was captured by Genseric and the Vandals in 439, reconquered by the Byzantines in 534, and finally, in 698, it fell into the hands of the Arabs and was depopulated. The last inhabitants were driven away by fever after the 8th century.

The ruins of the left bank of the Mejerda are often visited by travellers, but very little is left above the level of the ground. In 1869 A. Daux, the French engineer, explored them and made some important investigations. He was able to distinguish the fortifications, the acropolis, the quays of the commercial harbour and also of the military harbour or Cothon. Conjectural attempts have been made to identify the remains of large buildings with a temple of Apollo, the municipal Curia, the Arsenal and the Palace. The only certain identification, however, is that of the ruins of the amphitheatre, which was capable of holding 20,000 spectators, of the theatre, the baths, the reservoirs and the aqueduct which brought drinking water to the city. Subsequently there was found a Punic cemetery dating from the 5th century B.C. (Delattre, *Comptes-rendus de l'Acad. des Inscrip. et Belles Lettres*, 1906, p. 60). A number of coins have been found with Punic legends with the name Utica and heads of the Dioscuri Castor and Pollux. For the Roman period the coins have Latin legends and heads of Livia and Tiberius; they have also the names of the pro-consuls of the African province and of the local Duumvirs.

UTICA, a city and the county-seat of Oneida county, New York, U.S.A., on the Mohawk river, about 45 m. E. of Syracuse and about 85 m. W. of Albany. Pop. (1890) 44,007; (1900) 56,383, of whom 13,470 were foreign-born, including 3696 Germans, 2458 Irish, 1661 Italians and 1165 Welsh; (1910, census) 74,419. Utica is served by the New York Central & Hudson River and several lines leased by it, including the Rome, Watertown & Ogdensburg; the Delaware, Lackawanna & Western; the New York, Ontario & Western; and the West Shore railways; by the Erie Canal, and by interurban electric railways. The city is situated on ground rising gradually from the river. There are many fine business and public buildings, especially on Genesee Street, the principal thoroughfare, and Utica is known for the number of its institutions, public and private. Those of an educational character include, in addition to the public schools and the Utica Free Academy, the New School (for girls) and the Utica Catholic Academy. Among the libraries are included the Public Library (1893) with 54,000 volumes in 1909, the library of the Oneida Historical Society (which occupies the Munson-Williams Memorial Building), the Utica Law Library and the Deutscher Leserverein. The city is the seat of a State Hospital for the Insane (1843). Among its many charitable institutions are a Masonic Home and School (1893), a Home for the Homeless (1867), St Elizabeth's Home (1886), St Luke's Home (1869), a Home for Aged Men and Couples (1879), Utica Orphan Asylum (1830), St Joseph's Infant Home (1893) and St John's Female Orphan Asylum (1834), both under the Sisters of Charity; the House of the Good Shepherd (1872; Protestant Episcopal); and the General (1873; City of Utica), Homeopathic (1895), St Luke's (1869; supported by the Protestant Episcopal Churches), St Elizabeth's (1866; Sisters of the Third Order of St Francis) and Faxton (1873) hospitals. Among the public buildings are a Federal building, the city hall, the County Court House, a Y.M.C.A. building, a Masonic Temple, an Odd-Fellows' Temple and a State Armoury and Arsenal. The city has a number of fine parks. In Forest Hill Cemetery are the graves of Horatio Seymour and Roscoe Conkling. On West Canada creek, about 15 m. N. of Utica, are Trenton Falls, which descend 312 ft. in 2 m., through a sandstone chasm, in a series of cataracts, some of them having an 80 ft. fall. From the geological formation here the name Trenton is applied to the upper series of the Ordovician (or Lower Silurian) system, and, particularly, to the lowest stage of this series.

Utica has varied and extensive manufactures. In 1905 the capital invested in manufacturing industries was $21,184,033, and the total value of the factory products was $22,880,317, an increase of 38·8% since 1900. Of this product, hosiery and knit goods, with a total value of $5,261,166, comprised 23% of all, and cotton goods ($4,287,658), 18·7%. The hosiery and knit goods constituted 3·9% of the total value of that product of the entire country. Other important products were: men's clothing ($2,943,214); foundry and machine-shop products ($1,607,258); steam fittings and heating apparatus ($1,010,755); malt liquors ($933,278); and lumber products ($869,000). Among the other manufactures are food preparations, wooden ware, wagons and carriages, stoves and furnaces, boots and shoes, tobacco and cigars, flour, candy, gloves, bricks, tile and pottery, furniture, paper boxes and firearms. Utica is a shipping point for the products of a fertile agricultural region, from which are exported dairy products (especially cheese), nursery products, flowers (especially roses), small fruits and vegetables, honey and hops.

The territory on which Utica was built was part of the 22,000-acre tract granted in 1734 by George II. to William Cosby (*c.* 1695–1736), colonial governor of New York in 1732–36, and to his associates, and it was known as Cosby's Manor. During the Seven Years' War a palisaded fort was erected on the south bank of the Mohawk at the ford where Utica later sprung up. It was named Fort Schuyler, in honour of Colonel Peter Schuyler, an uncle of General Philip Schuyler. A fort subsequently built at Rome also was at first called Fort Schuyler (and afterwards Fort Stanwix), and the fort at Utica was then distinguished from it by the prefix "old" and it was as "Old Fort Schuyler" that Utica was first known. The most used trade route to the western country crossed the Mohawk here. In default of payment of arrears of rent Cosby's Manor was sold at sheriff's sale in 1792 and was bid in by General Philip Schuyler, General John Bradstreet, John Morin Scott and others for £1387, or about 15 cents an acre. Soon after the close of the War of Independence a settlement was begun, most of the newcomers being Palatine Germans from the lower Mohawk. In 1786 the proprietors had the manor surveyed. An inn was erected in 1788, and new settlers, largely New Englanders, began to arrive. Among these, in 1789, was Peter Smith (1768–1837), later a partner of John Jacob Astor, and father of Gerrit Smith, who was born here in 1797. In 1792 a bridge was built across the Mohawk. In 1797 Oneida county was established, and the village was incorporated under the name of Utica. The first newspaper, the *Gazette*, began publication in the same year, and the first church, Trinity (Protestant Episcopal), was built. The Erie Canal, completed in 1825, added to Utica's prosperity. Utica was chartered as a city in 1832.

See Pomroy Jones, *Annals and Recollections of Oneida County* (Rome, N.Y., 1851); M. M. Bagg, *Pioneers of Utica* (Utica, 1877); *Outline History of Utica and Vicinity* (Utica, 1900); and the publications of the Oneida Historical Society (Utica, 1881 sqq.).

UTILITARIANISM (Lat. *utilis*, useful), the form of ethical doctrine which teaches that conduct is morally good according as it promotes the greatest happiness of the greatest number of people. The term "utilitarian" was put into currency by J. S. Mill, who noticed it in a novel of Galt; but it was first suggested by Bentham. The development of the doctrine has been the most characteristic and important contribution of British thinkers to philosophical speculation. While British philosophizing up to a recent date has been notably lacking in width of metaphysical outlook, it has taken a very high place in its handling of the more practical problems of conduct. This is due in part, no doubt, to national character; but in the main, probably, to religious and political freedom, and the habit of discussing philosophical questions with regard to their bearing upon matters of religious and political controversy. The British moralists who wrote with political prepossessions are interesting, not merely as contributors to speculation, but as exponents of spiritual tendencies which were expressed practically in the political agitations of their times.

The history of utilitarianism (if we may use the term for the earlier history of a philosophic tendency which appeared long before the invention of the term) falls into three divisions, which may be termed theological, political and evolutional respectively. Hobbes, when he laid it down that the state of nature is a state of war, and that civil organization is the source of all moral laws, was under the influence of two great aversions, political anarchy and religious domination. It is in a clerical work written to refute Hobbes, Bishop Cumberland's *De Legibus Naturae* (pub. in 1672), that we find the beginnings of utilitarianism. Hobbes's conception of the state of nature antecedent to civil organization as a state of war and moral anarchy was obviously very offensive to churchmen. Their interest was to show that the gospel precept of universal benevolence, which owes nothing to civil enactment, was both agreeable to nature and conducive to happiness. Cumberland, therefore, lays it down that "The greatest possible benevolence of every rational agent towards all the rest constitutes the happiest state of each and all. Accordingly common good will be the supreme law"; and this supreme and all-inclusive law is essentially a law of nature. This important principle was developed by Cumberland with much originality and vigour. But his handling of it is clumsy and confused; and he does not make it sufficiently clear *why* the law of nature should be obeyed. He does, however, lay much stress upon the naturally social character of man; and this points forward to that treatment of morality as a function of the social organism which characterizes modern ethical theory. The further development of theological utilitarianism was conditioned by opposition to the Moral Sense doctrine of Shaftesbury and Hutcheson. Both these writers, more particularly the latter, had postulated in controverting Hobbes the existence of a moral sense to explain the fact that we approve benevolent actions, done either by ourselves or by others, which bring no advantage to ourselves. There was a general feeling that the advocates of the moral sense claimed too much for human nature and that they assumed a degree of unselfishness and a natural inclination towards virtue which by no means corresponded with the hard facts. The fire of human enthusiasm burnt low in the 18th century, and theologians shared the general conviction that self-interest was the ruling principle of men's conduct. Moral sense seemed to them a subjective affair, dangerous to the interests of religion. For, if the ultimate ground of obligation lay in a refined sensitiveness to differences between right and wrong, what should be said to a man who might affirm that, just as he had no ear for music, he was insensitive to ethical differences commonly recognized? Moreover, if mere sense were sufficient to direct our conduct, what need had we for religion? Such considerations prevailed where we might least expect to find them, in the mind of the idealist Berkeley. And it was another clergyman, John Gay, who in a dissertation prefixed to Law's translation of Archbishop King's *Origin of Evil* (pub. in 1731) made the ablest and most concise statement of this form of doctrine. What he says comes to this: that virtue is benevolence, and that benevolence is incumbent upon each individual, because it leads to his individual happiness. Happiness arises from the rewards of virtue. The mundane rewards of virtue are very great, but need to be reinforced by the favour or disfavour of God. Further advances along the same line of thought were made by Abraham Tucker in his *Light of Nature Pursued* (pub. 1768–74). Gay and Tucker supplied nearly all the important ideas of Paley's *Principles of Moral and Political Philosophy* (pub. in 1785), in which theological utilitarianism is summarized and comes to a close. Paley, though an excellent expositor and full of common sense, had the usual defect of common-sense people in philosophy—that of tame acquiescence in the prejudices of his age. His two most famous definitions are that of virtue as "the doing good to mankind, in obedience to the will of God and for the sake of everlasting happiness," and that of obligation as being "urged by a violent motive resulting from the command of another": both of which bring home to us acutely the limitations of 18th-century philosophizing in general and of theological utilitarianism in particular. Before we proceed to the next period of utilitarian theory we ought to go back to notice Hume's *Inquiry concerning the Principles of Morals* (pub. in 1751), which though utilitarian is very far from being theological. Hume, taking for granted that benevolence is the supreme virtue, points out that the essence of benevolence is to increase the happiness of others. Thus he establishes the principle of utility. "Personal merit," he says, "consists entirely in the usefulness or agreeableness of qualities to the person himself possessed of them, or to others, who have any intercourse with him." This is plain enough; what remains doubtful is the reason why we approve of these qualities in another man which are useful or agreeable to others. Hume raises the question explicitly, but answers that here is an ultimate principle beyond which we cannot hope to penetrate. For this reason Hume is sometimes classed as a moral-sense philosopher rather than as a utilitarian. From his point of view, however, the distinction was not important. His purpose was to defend what may be called a humanist position in moral philosophy; that is, to show that morality was not an affair of mysterious innate principles, or abstract relations, or supernatural sanctions, but depended on the familiar conditions of personal and social welfare.

The rise of political utilitarianism illustrates most strikingly the way in which the value and dignity of philosophical principles depends on the purpose to which they are applied. Abstractly considered, Bentham's interpretation of human nature was not more exalted than Paley's. Like Paley, he regards men as moved entirely by pleasure and pain, and omits from the list of pleasures most of those which to well-natured men make life really worth living: and he treats all pleasures as homogeneous in character so that they can be measured into equal and equally desirable lots. But his purpose was the exalted one of effecting reforms in the laws and constitution of his country. He took up the greatest happiness principle not as an attractive philosopheme, but as a criterion to distinguish good laws from bad. Sir John Bowring tells us that when Bentham was casting about for such a criterion "he met with Hume's *Essays* and found in them what he sought. This was the principle of utility, or, as he subsequently expressed it with more precision, the doctrine that the only test of goodness of moral precepts or legislative enactments is their tendency to promote the greatest possible happiness of the greatest possible number." These opinions are developed in his *Principles of Morals and Legislation* (pub. in 1789) and in the *Deontology* (published posthumously in 1834). Philosophically Bentham makes but little advance upon the theological utilitarians. His table of springs of actions shows the same mean-spirited omissions that we notice in his predecessors; he measures the quantity of pleasures by the coarsest and most mechanical tests; and he sets up general pleasure as the criterion of moral goodness. It makes no considerable difference that he looked for the moral sanction not to God but to the state: men, in his scheme, are to be induced to obey the rules of the common good by legally ordained penalties and rewards. He never faced the question how a man is to be induced to act morally in cases where these governmental sanctions could be evaded or did not exist in the particular state in which a man chanced to find himself. These principles of Bentham were the inspiration of that most important school of practical English thinkers, the Philosophic Radicals of the early 19th century; these were the principles on which they relied in those attacks upon legal and political abuses. From Bentham the leadership in utilitarianism passed to James Mill, who made no characteristic addition to its doctrine, and from him to John Stuart Mill. John Mill wrote no elaborate treatise on the subject. But he did something better than this. His essay *Utilitarianism* (pub. in 1863) sums up in brief and perfect form the essential principles of his doctrine, and is a little masterpiece worthy to be set beside Kant's *Metaphysic of Morals* as an authoritative statement of one of the two main forms of modern ethical speculation. Though in its abstract statement John Mill's doctrine may not differ very greatly from that of his predecessors, actually there is a vast change. To say that pleasure is the moral end is a merely formal statement: it makes all the difference what experiences you regard as pleasant and which pleasures you regard as the most important. Mill belonged to a generation in which the most remarkable feature was the growth of sympathy. He puts far greater stress than his predecessors upon the sympathetic pleasures, and thus quite avoids that appearance of mean prudential selfishness that is such a depressing feature in Paley and Bentham. Moreover, it is in sympathy that he finds the obligation and sanction of morality. "Morality," he says, "consists in conscientious shrinking from the violation of moral rules; and the basis of this conscientious sentiment is the social feelings of mankind; the desire to be in unity with our fellow-creatures, which is already a powerful principle in human nature, and happily one of those which tend to become stronger from the influences of advancing civilization." Such passages in Mill have their full significance only when we take them in connexion with that rising tide of humanitarian sentiment which made itself felt in all the literature and in all the practical activity of his time. The other notable feature of John Mill's doctrine is his distinction of value between pleasures: some pleasures, those of the mind, are higher and more valuable than others, those of the body. It is commonly said that in making this distinction Mill has practically given up utilitarianism, because he has applied to pleasure (alleged to be the supreme criterion) a further criterion which is not pleasure. But the validity of this criticism may fairly be questioned. Pleasure is nothing objective and objectively measurable: it is simply feeling pleased. The merest pleasure-lover may consistently say that he prefers a single glass of good champagne to several bottles of cooking-sherry; the slight but delicate experience of the single glass of good wine may fairly be regarded as preferable to the more massive but coarser experience of the large quantity of bad wine. So also Mill is justified in preferring a scene of Shakespeare or an hour's conversation with a friend to a great mass of lower pleasure. The last writer who, though not a political utilitarian, may be regarded as belonging to the school of Mill is Henry Sidgwick, whose elaborate *Methods of Ethics* (1874) may be regarded as closing this line of thought. His theory is a sort of reconciliation of utilitarianism with intuitionism, a position which he reached by studying Mill in combination with Kant and Butler. His reconciliation amounts to this, that the rule of conduct is to aim at universal happiness, but that we recognize the reasonableness of this rule by an intuition which cannot be further explained.

Even before the appearance of Sidgwick's book utilitarianism had entered upon its third or evolutional phase, in which principles borrowed from biological science make their entrance into moral philosophy. The main doctrine of evolutional or biological ethics is stated with admirable clearness in the third chapter of Darwin's *Descent of Man* (pub. in 1871). The novelty of his treatment, as he says, consists in the fact that, unlike any previous moralist, he approached the subject "exclusively from the side of natural history." Theological and political utilitarianism alike had been individualistic. But Darwin shows how the moral sense or conscience may be regarded as derived from the social instincts, which are common to men and animals. To understand the genesis of human morality we must study the ways of sociable animals such as horses and monkeys, which give each other assistance in trouble, feel mutual affection and sympathy, and experience pleasure in doing actions that benefit the society to which they belong. Both in animals and in human societies individuals of this character, being conducive to social welfare, are encouraged by natural selection: they and their society tend to flourish, while unsociable individuals tend to disappear and to destroy the society to which they belong. Thus, in man, do sentiments of love and mutual sympathy become instinctive and, when transmitted by inheritance, innate. When man has advanced so far as to be sensitive to the opinions of his fellow-men, their approbation and disapprobation reinforce the influence of natural selection. When he has reached the stage of reflection there arises what we know as conscience. He will approve or disapprove of himself according as his conduct has fulfilled the conditions of social welfare. "Thus the imperious word *ought* seems merely to imply the consciousness of a persistent instinct, either innate or partly acquired, serving as a guide, though liable to be disobeyed."

The most famous of the systematic exponents of evolutional utilitarianism is, of course, Herbert Spencer, in whose *Data of Ethics* (1879) the facts of morality are viewed in relation with his vast conception of the total process of cosmic evolution. He shows how morality can be viewed *physically*, as evolving from an indefinite incoherent homogeneity to a definite, coherent heterogeneity; *biologically*, as evolving from a less to a more complete performance of vital functions, so that the perfectly moral man is one whose life is physiologically perfect and therefore perfectly pleasant; *psychologically*, as evolving from a state in which sensations are more potent than ideas (so that the future is sacrificed to the present) to a state in which ideas are more potent than sensations (so that a greater but distant pleasure is preferred to a less but present pleasure); *sociologically*, as evolving from approval of war and warlike sentiments to approval of the sentiments appropriate to international peace and to an industrial organization of society. The sentiment of obligation Spencer regards as essentially transitory; when a man reaches a condition of perfect adjustment, he will always do what is right without any sense of being obliged to it. The best feature of the *Data of Ethics* is its anti-ascetic vindication of pleasure as man's natural guide to what is physiologically healthy and morally good. For the rest, Spencer's doctrine is valuable more as stimulating to thought by its originality and width of view than as offering direct solutions of ethical problems. Following up the same line of thought, Leslie Stephen with less brilliance but more attention to scientific method has worked out in his *Science of Ethics* (1882) the conception of morality as a function of the social organism: while Professor S. Alexander in his *Moral Order and Progress* (pub. in 1889) has applied the principles of natural competition and natural selection to explain the struggle of ideals against each other within society: moral evil, says Professor Alexander, is in great part a defeated variety of moral ideal. There is no doubt that much remains still to be done in illustrating human morality by the facts and principles of biology and natural history. A. Sutherland's *Origin and Growth of the Moral Instinct* (pub. in 1898) is a capable piece of work in this direction. Professor L. T. Hobhouse's *Morals in Evolution* and Professor Westermarck's *Origin and Development of the Moral Ideas* (both published in 1906) deal with the matter from the side of anthropology.

See E. Albee's *History of English Utilitarianism* (1902), a complete and painstaking survey. Leslie Stephen's *English Utilitarians* (pub. in 1900) deals elaborately with Bentham and the Mills, but more as social and political reformers than as theoretic moralists. See also ETHICS. (H. ST.)

UTMAN KHEL, a Pathan tribe who occupy the hills to the north of Peshawar in the North-West Frontier Province of India. Their country lies between the Mohmands and the Ranizais of Swat, to the west and south-west of the junction of the Swat and Panjkora rivers. They claim to be descendants of Baba Utman, who accompanied Mahmud of Ghazni in his expedition into India in 997. The Utman Khel are a tall, stout and fair race, but in their dress and general customs have assimilated themselves to the neighbouring peoples of Bajour. They have none of the vices of the Yusafzais. Their country is very hilly and difficult, but well cultivated in terraces. They number some 40,000, and their fighting strength is about 8000 men. British expeditions were necessary against them in 1852, 1878 and 1898.

UTOPIA, an ideal commonwealth, or an imaginary country whose inhabitants are supposed to exist under the most perfect conditions possible. Hence the terms *Utopia* and *Utopian* are also used to denote any visionary scheme of reform or social theory, especially those which fail to recognize defects inherent in human nature. The word first occurs in Sir Thomas More's *Utopia*, which was originally published in Latin under the title *De Optimo Reipublicae Statu, deque Nova Insula Utopia* (Louvain, 1516). It was compounded by More (*q.v.*) from the Greek οὐ, not, and τόπος, a place, meaning therefore a place which has no real existence, an imaginary country.

The idea of a Utopia is, even in literature, far older than More's romance; it appears in the *Timaeus* of Plato and is fully developed in his *Republic*. The idealized description of Sparta in Plutarch's life of Lycurgus belongs to the same class of literary Utopias, though it professes to be historical. A similar idea also occurs in legends of world-wide currency, the best known of these being the Greek, and the medieval Norse, Celtic and Arab legends which describe an earthly Paradise in the Western or Atlantic Ocean (see ATLANTIS). Few of these survived after the exploration of the Atlantic by Columbus, Vasco da Gama and others in the 15th century; but in literature More's *Utopia* set a new fashion. An ideal state of society is described in the writings of Hobbes, Sir Robert Filmer and J. J. Rousseau. In Bacon's *New Atlantis* (1624–29) science is the key to universal happiness; Tommaso Campanella's *Civitas Solis* (1623) portrays a communistic society, and is largely inspired by the *Republic* of Plato; James Harrington's *Oceana* (1656), which had a profound influence upon political thought in America, is a practical treatise rather than a romance, and is founded on the ideas that property, especially in land, is the basis of political power, and that the executive should only be controlled for a short period by the same man or men. Bernard de Mandeville's *Fable of the Bees* is unique in that it describes the downfall of an ideal commonwealth. Other Utopias are the "Voyage en Salente" in Fénelon's *Télémaque* (1699); Étienne Cabet's *Voyage en Icarie* (1840); Bulwer Lytton's *The Coming Race* (1871); Samuel Butler's *Erewhon* (1872) and *Erewhon Revisited* (1901); Edward Bellamy's *Looking Backward* (1888); William Morris's *News from Nowhere* (1890); H. G. Wells's *Anticipations* (1901), *A Modern Utopia* (1905) and *New Worlds for Old* (1908). Many Utopias, such as the *Fable of the Bees* and *Erewhon*, are designed to satirize existing social conditions as well as to depict a more perfect civilization. There are separate articles on all the authors mentioned above. A large number of the more recent Utopias have been inspired by socialistic or communistic ideals; among these may be mentioned *Freiland, ein soziales Zukunftsbild* (1890) and *Reise nach Freiland* (1893), by the Austrian political economist Theodor Hertzka (b. Budapest, 1845), which portray an imaginary communistic colony in Central Africa.

UTRECHT, a town of northern Natal, 30 m. by rail E. by N. of Newcastle. Pop. (1904) 1315. It is the chief place in a district of the same name, originally settled in 1848 by emigrant Boers from Natal. They formed an independent community and in 1854 obtained, in exchange for a hundred head of cattle, formal cession of the territory from Panda, the Zulu king. In 1858 the district was united with the republic of Lydenburg, and in 1860, with Lydenburg, became part of the South African Republic. In 1903 it was, with the neighbouring district of Vryheid, annexed to Natal. The town of Utrecht is built in a hollow among the foothills of the Drakensberg. In the neighbourhood are extensive coal-fields.

UTRECHT, the smallest province of Holland, bounded S. by Gelderland and South Holland, W. by South Holland, N. by North Holland and the Zuider Zee and E. by Gelderland. It has an area of 534 sq. m. and a pop. (1905) of 276,543. It belongs chiefly to the basin of the Rhine; the Lower Rhine, which skirts its southern border, after sending off the Crooked Rhine at Wijk, becomes the Lek, and the Crooked Rhine in its turn, after sending off the Vecht at Utrecht to the Zuider Zee, becomes the Old Rhine. The north-eastern portion of the province is drained by the Eem, which falls into the Zuider Zee. The watershed between the Rhine and the Eem is formed by a plateau of sand and gravel hills which extend from the south-east corner on the Rhine to Zeist near Utrecht, and also northwards to Huizen on the Zuider Zee. On its western side the plateau declines into the clay lands (and in the north-west low fen) which characterize the western half of the province. The region of sand and gravel is covered with bare heaths and patches of woods, and the occupations of the scanty population are chiefly those of buckwheat cultivation and peat-digging, as in Drente. Amersfoort is here the only town of any size, but along the western edge of this tract there is a row of thriving villages, namely, Amerongen, Leersum, Doorn, Driebergen and Zeist. Bunschoten on the Zuider Zee is a fishing village; Venendaal, on the south-eastern border, originally a fen-colony, is now a market for the bee-keeping industry in the east. On account of the picturesqueness of this part of the province, many country houses and villa residences are found scattered about it. The western half of the province is flat and often below sea-level. Cattle-rearing and the making of cheese (of the Gouda description) and butter are here the chief occupations. Agriculture is practised along the Crooked Rhine, wheat, barley, beans and peas being the chief products, and there is considerable fruit-farming in the south-west. The development of towns, however, has here been restricted by the rise of Utrecht, the chief town of the province, as a commercial centre. A number of small old towns are found along the Rhine, the Lek and the Holland Ysel, such as Rhenen (or Reenen), Wyk-by-Duurstede, Yselstein, Montfoort. Rhenen was once the seat of an independent lordship, though afterwards joined to the bishopric of Utrecht. The ancient church has a fine tower (1492–1531). Wyk-by-Duurstede, originally a Roman settlement, was of some commercial importance as early as the 7th and 8th centuries, but decayed owing to Norman raids in the 10th century. The ruined castle of the bishops of Utrecht still remains. The lordship of Yselstein can be traced back to the younger brother of Gysbrecht IV. of Amstel, who bought lands and built a castle here before 1279. In the beginning of the next century it had grown to the size of a small town and was granted civic rights and surrounded with walls, and in the course of the following centuries was frequently attacked and even devastated. About 1377 Ystelstein descended to the house of Egmont, and in 1551 to the house of Orange, and by paying an annual contribution to the United Provinces remained an independent barony till 1795. The remains of the castle are picturesque. Montfoort owes its origin to a castle built by the bishop of Rhenen in 1170, which was frequently besieged in the 14th and 15th centuries. In 1833 it was bought by the government, and now serves as a reformatory for women. Vreeland on the Vecht has a similar origin in the castle built by Bishop Hendrik of Vianen in 1253–59 as a protection to the province against the lords of Amstel. The castle was demolished in 1529 when the province came under Burgundian rule. The province is traversed by the main railway lines, which all converge at Utrecht, and is also amply provided with navigable waterways.

The province represents the bulk of the territories once comprised in the ancient prince-bishopric of the same name, *het Sticht* (the see) of Dutch historians. The see was founded in 722 by St Willibrord, and the diocese thus formed, saving for a short time when it was an archbishopric, was subordinate to the see of Cologne. It covered all the northern Netherlands between the Scheldt and the Ems. The bishops, in fact, as the result of grants of immunities by a succession of German kings, and notably by the Saxon and Franconian emperors, gradually became the temporal rulers of a dominion as great as the neighbouring counties and duchies. Bishop Balderic (918–76) successfully defended the see against the Northmen, and received from the emperor Otto I. the right to coin money and all the land between the Leck and the Zuider Zee. The bishopric was weak, however, as compared with the neighbouring states, Holland, Gelderland and Brabant, from the mere fact of its ecclesiastical character. The bishop had no hereditary or dynastic interest in his land, and, as a temporal ruler, his powers were limited by the necessity of having to secure the goodwill of the higher clergy, of the nobles and of the cities, and also because of his relations to the German king and the pope as an ecclesiastical prince of the empire. The middle ages were marked by constant wars between the bishops of Utrecht and the counts of Holland and Gelderland. The growth of the power of Holland, however, under a succession of strong and capable rulers led to the bishopric becoming, during the 14th century, almost a dependency of the county. The death of every bishop was always the signal for violent disputes among the neighbouring feudal states, each of them intriguing to secure the election of its own candidate; but, as stated above, Brabant and Gelderland had at last to recognize the fact of the supremacy of Holland over the see. In the 15th century this supremacy passed to the dukes of Burgundy, and finally, in 1527, Bishop Henry of Bavaria sold his temporal rights to the emperor Charles V. In 1559 the see of Utrecht was by Pope Paul IV. raised to the dignity of an archbishopric. At the time of the revolt against Spain Utrecht took the Protestant side, and was one of the seven provinces which signed the Union of Utrecht in 1579. Each of these provinces retained in a large measure its sovereign rights and its own laws, privileges and customs. During the republican period the estates of Utrecht consisted of three "members." The chapter of the see was secularized, and out of the members of the five colleges a certain number, known as "the Elected" (*Geëligerden*), were chosen by the other two "members" of the estates. They held office for life, and were reckoned as the "first member" of the estates. The knights formed the "second member," the representatives being chosen by co-option. The city of Utrecht, with the four smaller towns of Amersfoort, Rheenen, Wijk-by-Duurstede and Montfoort, made up the "third member."

(G. E.)

The later history of the see of Utrecht is of considerable ecclesiastical interest. The last archbishop of Utrecht, Frederick van Schenk van Toutenburg, died in 1580, a few months before the suppression of Roman Catholic public worship by William of Orange. Two successors were nominated by Spain, both of whom were unable from political causes to take possession of the see. In 1583 the chapter elected Sasbold Vosmeer, Catholic priest at the Hague, vicar-general; the election was confirmed in 1590 by the papal nuncio at Brussels, and in 1602 Vosmeer was consecrated at Rome archbishop of Philippi *in partibus*. After Vosmeer's death (1612) Philip Rovenius van Ardensul was elected by the chapter and confirmed by the pope. In 1631 he formed the surviving members of the chapters of Utrecht and Haarlem into a collegiate body which became known as the chapter of Utrecht. Rovenius was succeeded as vicar-general in 1651 by Jacob de la Torre, consecrated as archbishop of Ephesus. Under his vicariate trouble with Rome began, the pope insisting on his right as universal bishop to appoint the vicar-general's coadjutor and successor. It was not, however, until the vicariate of Peter Codde, consecrated vicar-general with the title of bishop of Sebaste *in partibus* in 1669, that the quarrel came to a head. Codde was the nominee of the Dutch secular clergy, and these had for years past been at violent odds with the Jesuits, the champions of the ultramontane principle. The publication of an anonymous pamphlet in 1697, entitled "A Short Memoir on the State and Progress of Jansenism in Holland" (*Kort gendenkschrift van den staat en voortgang van het Jansenisme in Holland*), gave the latter their opportunity. Codde was accused of being its author, and though he successfully refuted this charge, he was ultimately deposed for Jansenism (1702), his opponent, Theodor de Kock, being appointed in his place. The result was a schism which was only temporarily checked by the expulsion of de Kock from the country by the states-general. Codde himself died in 1710. The Church of Utrecht was now without a bishop, and it was believed at Rome that the movement of revolt would soon perish for want of priests, especially as, with the constant influx of regulars, the number of Codde's adherents had steadily decreased. As a result of the publication of the bull *Unigenitus* by Pope Clement VII. in 1713, however, many French Jansenist priests took refuge in Holland, and so kept the church alive. In 1723 the chapter of Utrecht, in order to preserve the canonical succession of the Dutch clergy, elected Cornelius Steenoven archbishop. He was consecrated (15th October 1724) by Dominique Varlet, bishop of Babylon *in partibus*, who, having been deposed by the pope for Jansenism, had settled in Amsterdam in 1720. The pope replied to this by excommunicating all those who had taken part in the election and consecration. Undeterred by this, the chapter, on the death of Steenoven, elected as archbishop Cornelis Jan Burchman, who was consecrated by the bishop of Babylon on the 30th of September 1725. From this time onward the Jansenist Church of Holland has continued as an independent body, accepting the authority of the general councils, up to and including that of Trent, but basing itself on the Gallican theory of Episcopacy (*q.v.*) and rejecting the Vatican council, the infallibility of the pope and the papal dogma of the Immaculate Conception. Under Archbishop Peter Jan Meindaerts (d. 1767) two suffragan sees were created, that of Haarlem in 1742, that of Deventer in 1757. The Church had shrunk considerably since the 18th century, but in the first decade of the 20th showed signs of revival as a *point d'appui* for Catholics restive under the yoke of the ultramontanism dominant in the Roman Church. With the Church of Utrecht the Old Catholic movement in Germany at first established close relations, the first German Old Catholic bishop, Dr Reinkens, being consecrated by H. Heykamp, bishop of Deventer, in 1873. The Jansenist Church is, however, intensely conservative, and viewed with extreme disapproval the departures made by the German Old Catholics from Catholic tradition, notably in the matter of clerical celibacy. It refused, moreover, to recognize the validity of Anglican orders, and consequently to follow the example of the other Old Catholics in establishing intercommunion with the Church of England. This attitude towards the English Church was accentuated by the consecration, on the 28th of April 1908, of Mr Arnold Harris Mathew[1] as bishop of the Old Catholics in England by Dr Gerard Gul, Jansenist archbishop of Utrecht. The singular offshoot of the Church of Utrecht thus created established its headquarters in a former Congregational chapel (dedicated significantly to the Englishman St Willibrord, the first bishop of Utrecht) in River Street, London, N., the minister of which had joined the movement with his congregation. In 1910 Bishop Mathew claimed that his community numbered between 500 and 600, with ten priests, and that he had had many inquiries from both Roman Catholic priests, discontented with the Vatican policy, and Anglican clergy, uneasy about the validity of their orders (see an "interview" in the *Daily Graphic*, September 4, 1910). Meanwhile, in Holland itself the Roman Catholic hierarchy had been restored by Pope Pius IX. in 1851, with Utrecht as the archiepiscopal see. (W. A. P.)

For the Old Catholic Church see the article "Jansenistenkirche," by Dr J. A. Gerth van Wijk, in Herzog-Hauck, *Realencyklopädie* (3rd ed., Leipzig, 1900), pp. 599–606, where further references are given.

UTRECHT, a city of Holland, capital of the province of Utrecht, on the Crooked Rhine, which here divides into the

[1] Bishop Mathew (b. 1855) about the year 1892 claimed and for a while assumed the title of earl of Llandaff (*sic*), as grandson of Arnold Nesbit Mathew (d. 1820), who was said to have been the eldest son of the first earl of Llandaff, though neither he nor his eldest son ever claimed the title (see G. E. C(okayne)), *Complete Peerage*; corrigenda to vol. v. in vol. viii. p. 450).

Old Rhine and the Vecht. Pop. (1905) 114,321. It is an important junction station 22 m. by rail S.S.E. of Amsterdam. Tramways connect it with Vreeswyk on the Lek (where are the large locks of the Merwede canal), Amsterdam, and by way of De Bilt with Zeist, and thence with Arnhem. It is a picturesque and interesting old town with more regular streets and shady squares and fewer canals than most Dutch towns. It is an important fortress, forming the principal *point d'appui* of the line of defensive inundations called the "New Holland Water Line," in addition to its position as a railway centre. The defences consist of an inner line of works which preserve the place against surprise, and of an outlying chain of detached forts of fairly modern construction, forming roughly two-thirds of a circle of three miles radius. Of these the works facing the east would in war time cover the assembly of troops destined to operate outside the Water Line, while those of the north and south fronts would be surrounded by inundations and serve chiefly to control the sluices. The line of the ancient ramparts, demolished in 1830, is now only marked by the Singel, or outer canal, which surrounds the oldest part of the city, with pleasant gardens and promenades laid out on the inside. Two canals, the Oude and the Nieuwe Gracht, intersect the town from end to end. On the Oude Gracht the roadway and quay are on different levels, the roadway lying over vaults, which open on the quay wall and are used as cellars and poor dwelling-houses. On the east of the town is the Maliebaan or Mall, consisting of an ancient triple avenue of lime trees, now largely replanted. Utrecht is the seat of a university, and of a Roman Catholic archbishopric. It is also the seat of the archbishop of the Dutch Old Catholics. The Domkerk, dedicated to St Martin, the former cathedral church of the bishops of Utrecht, is a large Gothic building, erected in 1254–1267 on the site of the original church founded by St Willibrord about 720 and completed by Bishop Adelbold about 1015. An open space forming the heart of the square in which the church stands separates the solitary western tower (14th century) from the choir and transept, the nave having been blown down by a violent hurricane in 1674 and never rebuilt. The interior (30 ft. wide and 115 ft. high) has been clumsily fitted up with pews and galleries for Protestant worship, so that the effect of its slender columns is spoilt. It contains the monuments of Admiral van Gent (d. 1672) and of Bishops Guy of Hainaut (d. 1317) and George of Egmont (d. 1559), while in the crypt are preserved the hearts of the German emperors Conrad II. (1039) and Henry V. (1125). The Roman Catholic cathedral of St Catherine dates from 1524 and has been restored in modern times. Other churches of very early foundation in Utrecht are the Pieterskerk and the Janskerk. Attached to the Domkerk by fine old Gothic cloisters is the university, which was founded in 1634 and enlarged in 1894. The students number some 750, and there are five faculties of theology, law, medicine, mathematics and science, and letters. The *aula* (restored in 1879) was originally the chapter-house of the cathedral. Connected with the university are a valuable library, occupying the palace built for Louis Bonaparte, king of Holland, in 1807 and containing upwards of 200,000 volumes and MSS.; a museum of natural history; an ophthalmic institute; physical and chemical laboratories; a veterinary school; a botanic garden; and an observatory. The archiepiscopal museum (1872) contains examples of all branches of sacred art in the Netherlands. In the Museum Kunstliefde is a small picture-gallery, chiefly remarkable for some pictures by Jan Scorel (1495–1562); the museum of antiquities contains a miscellaneous collection. Other buildings of interest are the museum of industrial art; the so-called "Pope's house," built in 1517 by Adrian Floriszoon Boeyens, afterwards Pope Adrian VI., and a native of Utrecht; the royal mint of Holland; the Fleshers' Hall (1637); the home for the aged, occupying a 14th-century mansion; the town hall (1830); and the large hospital prison and barracks. The most important industrial establishments are cigar manufactories, manufactories of chemicals and earthenware, and brass foundries, and there is also an active trade in the agricultural produce of the surrounding country.

The country round about Utrecht is pretty and plentifully studded with country houses, especially on the road to Arnhem. Close by, on the north-east, is the village of De Bilt, the seat of the Dutch Meteorological Institute. In this parish was formerly situated the famous Benedictine convent of Oostbroek, founded in the beginning of the 12th century. The abbey was demolished in 1850. The manor of Zuilen on the Vecht, four miles north-west of Utrecht, was partly held in fief from this abbey and partly from the bishops of Utrecht. The lords of Zuilen grew very powerful and built a castle here at the end of the 13th century. In 1302 this possession passed by marriage to the influential family of van Borsele, lords of Veere and governors of Zeeland. But on the extinction of that house towards the end of the 15th century the castle passed through various hands until it came by marriage in 1665 to the family of Baron van Tuyll van Serooskerke. The castle was carefully restored in 1752, and is still in excellent preservation. Five miles east of Utrecht is the village of Zeist, the seat of a Moravian settlement established here in 1746. There are also a fine castle (1667) and grounds, a sanatorium for children and numerous modern villa residences. At Ryzenburg, close by, is a Roman Catholic seminary, founded in connexion with the establishment of the Roman Catholic hierarchy in 1853 and practically serving as an archiepiscopal palace.

Utrecht (*i.e. Oude Trecht* or Old Ford, rendered in Latin documents *Vetus Trajectum*) is a city of great antiquity and much historic interest, especially as illustrating the growth of civic liberties during the middle ages. The place existed in Roman times and is mentioned in the itinerary of Antoninus. Though the name *Trecht* or *Trajectum* is almost universally found in old documents and on coins, the town was known by another name among the Frisians and Franks. Bede, writing in the 8th century, speaks of *Wiltaburg, id est oppidum Wiltorum, lingua autem Gallica Trajectum vocatur.* That any such people as the Wilten existed there is little evidence, but Wiltaburg (or variants of it) occurs in chronicles as late as the 12th century, and it is still preserved in the name Wildenburg, given to a Roman camp near the city.

The earliest authentic record of the town is that of the building of a chapel—afterwards destroyed by the heathen Frisians—by Dagobert I., king of the Franks, in 636; but the importance of the place began when St Willibrord (*q.v.*), the apostle of the Frisians, established his see there. This fact determined the development of the city. The bishop's seat had to be fortified against the incursions of the heathen Frisians and Northmen, and the security thus afforded attracted population till, after the destruction of its rival Dorestad by the Normans in the 9th century, Utrecht became the chief commercial centre of the northern Netherlands. Bishop Balderic (A.D. 918–976) was the real founder of the prosperity of the town. On his accession to the see Utrecht had just been sacked by the Northmen. He succeeded in driving the raiders away, rebuilt the walls, and during the fifty-eight years of his episcopate the town grew and prospered. Its gradual acquisition of civic rights followed the same line of development as in the German episcopal cities. At first the bishop, holding immediately of the Empire, was supreme. In feudal subordination to him a royal count, who was also *Vogt* (*advocatus*) of the cathedral church of St Martin, had his seat at Utrecht as the chief town of the *Gouw* (*Gau, pagus*) of Ifterlake. In the 11th century a burgrave (châtelain, *castellanus*), who was an episcopal officer, is found exercising jurisdiction in the city as well as the Vogt. Bishop Godebald (1122–1127) granted to the inhabitants of Utrecht and of Muiden, the neighbouring port on the Zuider Zee, their first privileges, which were confirmed on the 22nd of June 1122 by the emperor Henry V., who died at Utrecht in 1125. The extant imperial charter does not specify what were the municipal rights that were conceded, but it is certain that at this time they were very limited. The magistrates, the *Schout* or high bailiff and his assessors, the *Schepenen* (*scabini, échevins*), were nominated by the burgrave from the order of knights. In 1196 we read for the first time of councillors (*consules, consiliarii, adjurati*) as assessors of the magistrates, but these, who a little later were known as the *Raad* or council, were also nominated. The position was simplified when, in 1220, Albert van Cuyck, the last of the hereditary burgraves, sold his rights to the bishop. These ecclesiastical princes were churchmen in little but name, and their desire to be absolute rulers found itself confronted by the determination of the burghers to secure greater independence. As the 13th century advanced, the council, representing the wealthy and powerful gild of merchants, began to take a larger share in the government, and to restrict more and more the direct exercise of the episcopal authority. Of the rise of the craft gilds in Utrecht there is no record. They appear suddenly as fully developed organized corporations, able to impose their will upon bishop and aristocracy. All through the 13th century a continual struggle went on, but at last the gilds were victorious and were able to secure in the *Gildebrief* of 1304, confirmed by the bishop in 1305, a new constitution for the city. According to this, as emended by a later Gildebrief of 1347, the existing board of seven Schepenen were to retain office for life, but the new ones, elected yearly, were in future to be chosen by the Raad either in or outside the gilds. The Raad itself was to be chosen by the aldermen of the gilds. Two aldermen, later styled burgomasters, were to preside, the one over the Schepenen, the other over the Raad, sharing this presidency with two episcopal officials. The Schout was still to be nominated by the bishop from among the knights, but his powers were now comparatively insignificant. The two chief aldermen of the gilds, with the two episcopal official presidents above mentioned, together were to form the supreme government of the city. The victory of the democratic principle was entirely new in the Netherlands, though it had been anticipated in Florence, and was perhaps inspired by Italian example. In all other cities of the Netherlands the craft gilds remained in humble subjection to a council co-opted from a limited number of wealthy patrician families. In Utrecht, however, power was henceforth concentrated in the gilds, which became not only trade but political associations, which together constituted the sovereign community. In this government, though the Schepenen retained a dignified precedence, all power was practically concentrated in the popularly elected Raad, even the estates of the see (*Sticht*) had "nothing to say in the city."

The new liberties, as might be expected, did not tend to improve the relations between the town of Utrecht and its ecclesiastical sovereign; and the feud reached its climax (1481–84) in the "groote vorlag," or great quarrel, between the citizens and Bishop David, the Bastard of Burgundy, who had been foisted upon the unwilling chapter by the combined pressure of Duke Philip of Burgundy, his half-brother, and the pope. With the aid of John, burgrave of Montfoort, who had been called in, after the manner of the Italian podestas, and endowed with supreme power for the defence of the town, the Utrechters defeated all the efforts of their bishop, aided by the Hollanders and an aristocratic faction. They only succumbed when the weight of the archduke Maximilian was thrown into the scale against them (1484). Even then Bishop David was once more expelled in 1491. The last prince-bishop of Utrecht was Henry of Bavaria, who was elected, in May 1524, in succession to Philip of Burgundy. He took the part of the nobles against the burghers, but Duke Charles of Gelderland, jealous of the growing power of the house of Habsburg, intervened, put an end to the strife, and, in 1527, himself occupied the city. In July of the next year Bishop Henry was back again, having gained possession of the city by surprise; and in the following October he sold his temporal rights to the emperor Charles V. Utrecht, thus brought into immediate relations with the Spanish Habsburgs, proved no more tolerant of their rule than of that of its bishops, and took a leading part in the revolt of the Netherlands. The union of the seven northern provinces, proclaimed at Utrecht in 1579, laid the foundation of Dutch independence (see NETHERLANDS). The city proved indeed a refractory member of the new league; and, after the death of William the Silent, the Utrechters, jealous of the influence of their old enemies the Hollanders, refused to recognize the authority of the council of state, and elected a stadtholder of their own. Inside the city the old aristocratic and democratic factions still carried on their traditional struggle, complicated now by religious difficulties. The Roman Catholics, though still in the majority in the bishopric, had little influence on the politics of the city, where the aristocrats inclined to the moderate (libertine) opinions advocated by the preacher Hubrecht Duifhuis, while the democrats were organized in the new church order introduced by the uncompromising Calvinist Petrus Dathenus (d. 1581). The adhesion of Utrecht to the party of revolt was the work of the aristocratic party, and the critical state of affairs made it for a while dominant in the town. The gilds and burgher militia were deprived of all voice in the government, and the town council became an hereditary body. After the advent of the earl of Leicester as governor-general of the Netherlands in 1585, a change took place. The ultra-Calvinistic Adolph, count of Nuenar, who was elected stadtholder,overthrew the aristocratic government and placed the people in power. The Utrechters, under the leadership of Gerard Prouninek, otherwise Deventer, vehemently took the side of Leicester in his quarrel with the estates of Holland, and the English governor-general made the town his headquarters during residence in the Netherlands, and took it under English protection. Though heartily disliked in Holland, Leicester made himself so popular in Utrecht that the burgher guard even presented him with a petition that he would assume the sovereignty. The withdrawal of Leicester from the Netherlands was followed by the defeat of Deventer and the return of the aristocratic party to power. The issue was decided (October 5, 1558) when the democrats were defeated in battle. Deventer was imprisoned and banished, and the former Schout, Nicolas van Zuylen van Sevender, was restored to office. An attempt of the democratic party to regain power was temporarily successful (January 10, 1610); but the estates appealed to the States General and Maurice of Nassau, who had been appointed stadtholder on the death of Nuenar, put down the movement with a strong hand, and the Utrechters found themselves compelled to yield. From this time, until the French Revolution, the ancient democratic institutions of the city remained nothing but a name; the rights of the community were exercised by a municipal aristocracy, who held all power in their own hands. The gilds, once supreme, henceforth ceased to have any political importance. At Utrecht the treaty which closed the War of the Spanish Succession was signed on the 11th of April 1713. (G. E.)

UTRECHT, TREATY OF, the general name given to the important series of treaties which in 1713 and 1714 concluded the great European war of the Spanish Succession (*q.v.*), and by which *inter alia* England obtained possession of Newfoundland, Nova Scotia and Gibraltar.

Worsted, mainly through the genius of Marlborough, in his efforts to secure the whole of the great Spanish monarchy for his grandson, Philip, duke of Anjou, Louis XIV. made overtures for peace in 1706 and again in 1709. These were rejected, and failure also attended the negotiations between France and the United Provinces which took place at Gertruydenberg in 1710, negotiations only entered upon by the Dutch after they had by a treaty with England (October 1709) secured a guarantee that they would obtain the coveted barrier of fortresses against France. But matters changed greatly during 1710 and 1711. In England in August and September 1710, the Tories, the party of peace, succeeded the Whigs, the party of war and the inheritors of the tradition of William III., in the conduct of affairs. In the Empire in April 1711, the archduke Charles, Philip's rival for the throne of Spain, succeeded his brother Joseph I. as ruler of Austria and became prospective emperor, and England and the United Provinces, having waged a long and costly war to prevent the union of the crowns of France and Spain, were equally averse from seeing Spain and Austria under the same ruler. Moreover, the allies realized at last that it was impossible to dislodge Philip from Spain, and all the peoples were groaning under the expenses and the sufferings of the war. France and England came to terms, and the preliminaries of peace were signed in London in October 1711, their basis being a tacit acquiescence in the partition of the Spanish monarchy.

The congress opened at Utrecht on the 29th of January 1712, the English representatives being John Robinson, bishop of Bristol, and Thomas Wentworth, earl of Strafford. Reluctantly the United Provinces accepted the preliminaries and sent representatives, but the emperor refused to do so until he was assured that these preliminaries were not binding. This assurance was given, and in February the imperial representatives made their appearance. As Philip was not yet recognized, as king, Spain did not at first send plenipotentiaries, but the duke of Savoy sent one, and Portugal was also represented.

One of the first questions discussed was the nature of the guarantees to be given by France and Spain that these crowns would be kept separate, and matters did not make much progress until after the 10th of July 1712, when Philip signed a renunciation. Then, England and France having concluded a truce, the pace was quickened and the main treaties were signed on the 11th of April 1713.

By the treaty between England and France Louis XIV. recognized the Protestant succession in England and undertook to give no further aid to the Stuarts. France ceded to England Newfoundland, Nova Scotia or Acadia, the island of St Kitts or St Christopher, and the Hudson's Bay Territory ("sinum et fretum de Hudson, una cum omnibus terris, maribus, maritimis, fluviis, locisque, in dicto sinu et freto sitis"), and promised to demolish the fortifications of Dunkirk and to fill up its harbour. A commercial treaty signed between the two countries on the same day provided that each should allow the other the most favoured nation treatment, while each gave up the claim to the indiscriminate seizure of shipping which had been practised during the war.

The treaty between France and the United Provinces was mainly concerned with securing the barrier of fortresses. These arrangements were somewhat complicated and to a large extent provisional, as Austria and Bavaria, two countries which were deeply interested in the fate of the Netherlands, had not yet assented to the terms of peace. By a commercial treaty concluded on the same day, France gave to the Dutch commercial privileges similar to those enjoyed by England. Other treaties concluded at the same time were between France and Savoy, France and Prussia, and France and Portugal. By the first the duke of Savoy regained Savoy and Nice, taken from him during the war, and France undertook to obtain for him the island of Sicily and the title of king. By the second Prussia secured some small additions of territory, including part of Gelderland and Neuchâtel; in return France definitely and finally obtained the principality of Orange. It is interesting to note that as a constituent of the Empire Prussia was still fighting against France. The treaty between France and Portugal mainly concerned the Portuguese settlements in Brazil, her claim to these being recognized by France.

Other treaties were signed at Utrecht between Spain and the allies, Philip now concluding these as the recognized and lawful king of Spain. On the 13th of July 1713 a treaty was signed between England and Spain, which embodied certain commercial arrangements previously made between the two countries. Spain ceded to England Gibraltar and Minorca and promised to give up Sicily to Savoy. She gave also to England the monopoly for thirty years of the lucrative slave trade with Spanish America, hitherto enjoyed by France: this was the famous Asiento treaty. Finally, there was an article concerning the inhabitants of Catalonia, who had fought bravely for Charles of Austria, and who had a large claim upon the protection of England. However, the protection granted to them was a mere sham, and the Catalans were soon the victims of the revenge of Philip of Spain. The peace between Spain and the United Provinces was signed on the 26th of June 1714, but the conclusion of the one between Spain and Portugal was delayed until the following February. The former was concerned mainly with commercial matters, Spain giving the United Provinces the treatment of a most favoured nation, except as regards Spanish America. The latter dealt with the frontier between the two countries and with the colony of St Sacrament in Uruguay, which was transferred to Spain.

The treaty of Utrecht also provided some compensation for the emperor Charles VI. as soon as he surrendered his claim to Spain. It was arranged that he should receive Naples and Milan, and also the Spanish Netherlands, henceforward known as the Austrian Netherlands.

But the general pacification was still incomplete, as France and the Empire continued the war, albeit somewhat languidly. It was not long, however, before Charles VI. realized how inadequate were his forces, unsupported by those of England and of Holland, to meet the armies of France, and towards the close of 1713 he was for the first time seriously inclined to consider conditions of peace. Accordingly, his representative, Prince Eugene, met the French marshal Villars at Rastatt in November 1713, and here, after negotiations had been broken off and again resumed, peace was made on the 7th of March 1714, Charles VI. concluding the treaty without waiting for the assent of the different states of the Empire. This consent, however, was necessary, and a little later the representatives of some of the princes of the Empire met those of France at Baden, where, on the 7th of September 1714, the treaty of Baden, the last of the treaties included in the general peace of Utrecht, was signed. This dealt entirely with the question of the frontier between France and the Empire, which was restored as it was before the outbreak of the war except that France gained Landau.

One important matter dealt with at Utrecht remains to be mentioned. A second barrier treaty between England and the United Provinces was signed on the 30th of January 1713, and a third treaty signed at Antwerp on the 15th of November 1715 clinched the matter. Seven fortresses were to be garrisoned by a total of 35,000 men, three-fifths of the cost being borne by the imperial government and the remainder by the United Provinces.

The treaty of Utrecht is second to none in importance in English history. Its provisions were a most potent factor in assisting the expansion of England's colonial empire and also in the building up of the country's commercial greatness. In the domestic politics of the 18th century, too, the peace has a great and recurring importance. Its terms were bitterly assailed by the Whigs, and after the accession of George I. four of its Tory authors, Bolingbroke, Oxford, Ormonde and Strafford, were impeached for concluding it, the charges brought against them being that they had corresponded with the queen's enemies and had betrayed the honour and interest of their own country, while the abandonment of the Catalans was not forgotten.

The text of the treaty of Utrecht is published as the *Actes, mémoires et autres pièces authentiques concernant la paix d'Utrecht* (Utrecht, 1714–1715); and by C. W. von Koch and F. Schöll in the *Histoire abrégée des traités* (1817–1818). As far as it concerns the party politics of England, there is much about the peace in Dean Swift's works. See also C. Giraud, *La Paix d'Utrecht* (Paris, 1847); I. S. Leadam, *Political History of England 1702–1760* (1909); A. W. Ward in the *Cambridge Modern History*, vol. v. (1908), and the *State Trials* for the proceedings against the impeached English ministers. But perhaps the most valuable work on the whole peace is O. Weber's *Der Friede von Utrecht. Verhandlungen zwischen England, Frankreich, dem Kaiser und den Generalstaaten 1710–1713* (Gotha, 1891).
(A. W. H.*)

UTRERA, a town of southern Spain, in the province of Seville; on the Arroyo de la Antigua, a right-hand tributary of the river Guadalquivir, and at the junction of the Seville-Cadiz and Cordova-Utrera railways. Pop. (1900) 15,138. Utrera contains few noteworthy buildings, although it is an ancient town, still partly surrounded by medieval fortifications. The principal church, Santa Maria, is Gothic in style, dates from the 15th century, and contains some interesting tombs; but it was to a great extent restored in the 17th century. Agriculture and especially stock-farming are foremost among the local industries, which also include manufactures of leather, soap, oil and spirits. Large numbers of horses, sheep and fighting bulls are bred in the moorlands and marshes which extend eastward towards the Gaudalquivir, and a fair is held yearly in September for the sale of live stock and farm produce. Utrera was occupied by the Moors in the 8th century, and, though retaken by St Ferdinand (1230–52), was not finally incorporated in the kingdom of Castile until 1340. In the middle ages it was notorious as a favourite refuge of brigands and outlaws.

UTTARPARA, a town of British India, in the Hugli district of Bengal, on the river Hugli. Pop. (1901) 7036. It is famous for the public library founded and endowed by Jai Krishna Mukharji, which is specially rich in books on local topography. There is an aided college, and a girls' school supported by a native association.

UTTOXETER, a market town in the Burton parliamentary division of Staffordshire, England, 15 m. N.E. by E. of Stafford by a branch of the Great Northern railway. Pop. of urban district (1901) 5133. It is also served by the North Staffordshire railway. The town lies pleasantly on high ground near the river Dove, a western tributary of the Trent, here the boundary with Derbyshire. There are large works for the manufacture of agricultural implements, and brewing and brick-making are carried on. Several agricultural fairs are held annually. The church of St Mary has a fine decorated tower and spire; the rest of the fabric dates from 1828. Alleyn's grammar-school was founded in 1558. In the market-place here Dr Johnson stood hatless in the rain doing voluntary penance for disobedience to his father. A bas-relief commemorates the incident. The name of the town is locally Uxeter, or an approximate pronunciation. At Denstone, 5 m. N. of Uttoxeter, is St Chad's College, a large middle-class school for boys, founded in connexion with St Nicholas' College, Lancing.

Uttoxeter (*Wotocheshede, Uttokeshather, Utcester, Uttoxater*) was probably not a Roman site, although the termination of the name suggests one, and a few remains have been discovered. It formed part of the estates of Algar, earl of Mercia; at the time of the Domesday Survey it was held by the king; later it passed to the Ferrers family and was included in the honour of Tutbury. In the early 12th century Earl Robert de Ferrers constituted Uttoxeter a free borough, and granted to the inhabitants freedom from all tolls, tonnage, poundage and other exactions. These privileges were confirmed and amplified by a charter, dated August 15, 1251, from William de Ferrers, earl of Derby. Uttoxeter, with the rest of the honour of Tutbury, escheated to the Crown in 1266 owing to the complicity of Robert Ferrers in the barons' rebellion; it was regranted to Edmund Crouchback, ancestor of the dukes of Lancaster, under whom it became part of the duchy of Lancaster, from which it was not severed until 1625. The Wednesday market, which is still held, was granted by Henry III. to William Ferrers, earl of Derby, together with a fair to be held on the feast of the Nativity of the Blessed Virgin (September 8), which was kept up in the 18th century. In 1308 Thomas, earl of Lancaster, obtained the grant of a fair on the vigil, day and morrow of St Mary Magdalene. In Leland's time "the men of the town used grazing" in the "wonderful pastures upon Dove," and in the 17th and 18th centuries the market was the greatest in that part of England for cattle and provisions; in the 18th century it furnished cheeses to many London cheesemongers. In 1648, on the defeat of the invading Scottish army under the marquis of Hamilton by Cromwell, its leader was captured here by Lambert.

UXBRIDGE, a market town in the Uxbridge parliamentary division of Middlesex, England, 18 m. W. by N. of St Paul's Cathedral, London, on the river Colne, and on branches of the Great Western and Metropolitan railways. Pop. of urban district (1901), 8585. There are breweries, foundries and engineering works, and a considerable traffic is carried on by means of the Grand Junction Canal. The town, which is connected by electric tramway with Hammersmith, London, has extended considerably in modern times as a residential centre. The church of St Margaret is Perpendicular, and retains a fine font in that style, and several ancient monuments.

Uxbridge is an ancient borough, stated to have been one of those originated by Alfred the Great, but it is not mentioned in Domesday. Here negotiations were begun, on the 30th of January 1645, between the commissioners of Charles I. and the parliament, but were broken off on the 22nd of February. A part of the "Treaty House," in which they were carried on, remains. In 1647 the parliamentary forces had for some time their headquarters in the town. It remained a garrison town until 1689. It obtained the grant of a market from Henry II.

UXMAL, a deserted city of the Mayas in the state of Yucatán, Mexico, 20 m. W. of Tikul, a station on the railway between Merida and Valladolid. The ruins stand on a wooded plain, and cover an area of a little more than half a mile square, although fragments are found over a much larger space. Uxmal is the largest and most important of the deserted cities of Yucatán, and shows some of the finest specimens of Maya architecture. The climate is much drier than that of Chiapas, and the structures are in a better state of preservation than those of Palenque, but the rank vegetation and the decay of the wooden lintels over the doorways have broken down many of the walls. Uxmal was inhabited for some time after the Spanish conquest, but perhaps only by a remnant of a population once much larger. The neighbourhood is now very unhealthy, and it may be presumed that the process of depopulation, caused by increasingly unhealthy conditions and diminishing sources of food supply, was gradual. There are no streams near the ruins, and the water-supply was derived from cisterns and from a few pools now filled with soil and vegetation. A rather soft limestone was used in the buildings, but the locality of the quarries has not been discovered. The walls are commonly about 3 ft. thick, in some cases much thicker, and the stones were set in a whitish mortar. Stone implements were used. The outer surfaces of the walls are usually divided by a horizontal moulding into two unequal zones, the lower one plain with a band of sculptured ornaments at the base, and the upper elaborately sculptured. The interior walls were generally plastered and rarely ornamented. There are no windows, but large doorways. The jambs were of dressed stone, usually plain, and the longer lintels were of zapote wood; some of them, where protected from the weather, are still to be seen, sometimes covered with inscriptions. The buildings are rectangular in shape, long and narrow, divided usually into two ranges of rooms. They are generally arranged in groups of four, enclosing a quadrangular court, and sometimes singly on massive eminences. The interiors are cut up into numerous small rooms by transverse partitions, while numerous beam-holes and dumb-sheaves indicate other divisions. The rooms are covered by acutely pointed vaults, the stones forming the sides of the vault being bevelled to the angle, and the apex being covered by capstones covering spaces of one to two feet. The spaces between the vaults are filled with solid masonry, and above all is the roof covering, also of masonry, which is sometimes surmounted with an ornamental roof-comb. The buildings stand upon raised terraces, or upon truncated pyramids, approached by broad stairways, usually of cut stone.

There are five principal buildings or groups—the Temple of the Magician, Nunnery Quadrangle, House of the Turtles, House of the Pigeons and Governor's Palace. There are other structures and groups, smaller and more dilapidated. One of them, standing immediately S. of the Nunnery, consists of two parallel walls only; it is usually described as the ball-court, or gymnasium, a structure common to most Maya cities. The Temple of the Magician crowns an unusually steep pyramid 240×180 ft. at the base and 80 ft. high. It has three rooms, and a smaller temple is built against the upper western side of the pyramid. A broad steep stairway ascends to the summit platform on the E., and a narrower stairway to the lower temple on the W. The west front is filled with remarkable figures and designs, including the lattice work common in Uxmal. The Nunnery Quadrangle consists of four large rectangular independent buildings, enclosing a quadrangular court, the whole occupying a terrace over 300 ft. square at the base and upwards of 15 ft. above the level of the plain. The buildings resemble each other in the arrangement of their rooms, and their elaborately ornamented façades face inwards upon the court. The division of the buildings into numerous small rooms is understood to signify that they were used as communal habitations, possibly of priestly orders. The Governor's Palace, standing upon a triple terrace S. of the Nunnery, is, according to W. H. Holmes, "the most important single structure of its class in Yucatán, and for that matter in America." It is 320 ft. long, 40 ft. wide and 25 or 26 ft. high, divided into a long central and two end sections, separated by recesses and two transverse archways about 25 ft. long, 10 ft. wide and 20 ft. high. These archways were subsequently blocked, and may have been intended originally as portals to a quadrangle which was never built. The upper zone of the exterior walls is about 10 ft. wide, exclusive of the mouldings and ornamental frieze, and its total length of 720 ft. is crowded with sculptures, in which there are three principal motives —the mask, the fret and the lattice. The projecting snouts in the line of masks forming the upper part of this zone are a peculiar feature of Uxmal ornamentation. The House of the Turtles is a comparatively small structure near the N.W. corner of the Governor's Palace. It has the same features found in the other structures except for a line of sculptured turtles on the mouldings of the frieze. Immediately S.W. of the Governor's Palace is a huge truncated pyramid, 200×300 ft. at the base and 60 to 70 ft. high. Beyond this is another large quadrangular group known as the House of the Pigeons. It resembles the Nunnery Quadrangle, except that the northern building carries a peculiar roof-comb of colossal size, running its entire length and rising to a height of about 16 ft. The base of this comb is 4 ft. high, capped by a moulding and perforated by over 50 openings. Above this the comb is divided into nine sections rising by large steps to the apex, each pierced by 30 or more openings, like an immense dovecote. Projecting stones suggest that they were built to carry statues or figures like the roof-combs of Palenque.

UZ, JOHANN PETER (1720–1796), German poet, was born at Ansbach on the 3rd of October 1720. He studied law, 1739–43, at the university of Halle, where he associated with the poets Johann Ludwig Gleim (*q.v.*) and Johann Nikolaus Götz (*q.v.*), and in conjunction with the latter translated the odes of Anacreon (1746). In 1748 Uz was appointed unpaid secretary to the *Justizcollegium*, an office he held for twelve years; in 1763 he became assessor to the imperial court of justice at Nuremberg, in 1790 was made a judge and, on the annexation of

Ansbach to Prussia (2nd of December 1791), entered the Prussian judicial service, and died, shortly after his appointment as *Landrichter*, at Ansbach on the 12th of May 1796. Uz wrote a number of graceful lyrics in Gleim's style, and some patriotic odes; he is the typical representative of the rococo period in German poetry. In 1749 the first collection of his *Lyrische Gedichte* was anonymously published. He also wrote, in alexandrines, *Der Sieg des Liebesgottes* (1753), a close imitation of Alexander Pope's *Rape of the Lock*, and a didactic poem, *Versuch über die Kunst stets fröhlich zu sein* (1760).

A complete edition of Uz's works—*Sämtliche Poetische Werke*—was published at Leipzig, 1768; a new edition (Vienna, 1804), which has been often reprinted. A critical edition was published by A. Sauer in 1890. See Henriette Feuerbach, *Uz und Cronegk* (1866), *Briefe von Uz an einen Freund aus den Jahren 1753–82* (published by A. Henneberger (1866) and E. Petzet, *Johann Peter Uz* (Ansbach, 1896).

UZ. The "land of Uz" (ארץ עוץ) is best known as the scene of the story of Job. Its precise location is a matter of uncertainty, opinion being divided between a position N. of Palestine ("Aram Naharaim") and one to the S.E., in the neighbourhood of Edom. In favour of the former are the references in Gen. x. 23, xxii. 21, the inclusion of Job among "the children of the East," the possibility that Bildad the Shuhite (cf. Gen. xxv. 2, 6) belonged to the Sūḫu, a people living on the right bank of the Euphrates, and the description of Elihu as a Buzite (xxxii. 2). Whether the name Uz is found or not in the cuneiform inscriptions is disputed. In favour of the S.E. position we have the description of Elihu as of the family of Ram[1] which (1 Chron. ii.) was a distinctly southern people, the fact that Eliphaz was a Temanite (*i.e.* he came from Edom, cf. Gen. xxxvi. 4) and the references in Gen. xxxvi. 28 and Lam. iv. 21. The mention of Uz in Jer. xxv. 20 is probably a gloss. While Edom and Uz are not to be identified, the traditional association of "wisdom" with Edom may incline us to place the Uz of Job in its neighbourhood rather than in that of the Euphrates. The tradition which places Job's home in Hauran has no value. It is worth noting that the Septuagint forms from Uz the adjective *Αὐσῖτις*, which points to a pronunciation *Auṣ*=Arabic *Auḍ*, the name of a god whose worship was widely spread and might therefore be readily borne by tribes or attached to districts in several regions.

UZÈS, a town of southern France, capital of an arrondissement in the department of Gard, finely situated on an eminence above the Alzon, 16 m. N. by E. of Nîmes by road. Pop. (1906) 4008. Uzès, the seat of an episcopal see from the 5th century to 1790, has a cathedral almost destroyed by the Protestants during the religious wars and rebuilt in the 17th and 18th centuries, but still flanked by a round tower of five storeys lighted by arched openings and dating from the 12th century. The Duché, a château of powerful lords, at first viscounts, and in 1565 dukes, of Uzès, preserves a donjon originally of the 12th century; the main building, flanked by a Gothic chapel, is Renaissance in style. The most ancient structure in the town is a crypt beneath a private house, attributed to the early centuries of the Christian era. The sub-prefecture and the tribunal of first instance occupy the old bishop's palace (17th century). There is a statue of Admiral Brueys (1753–1798), a native of the town. Uzès has a communal college for boys, and carries on the manufacture of silk, bricks and fireproof earthenware, and liquorice, and trade in the truffles for which the district is noted.

UZHITSE (also written Užice and Ushitsa), the capital of the Uzhitse department of Servia. As implied by its name, which may be translated "the narrow places," Uzhitse is built in a narrow and lonely glen amongst the south-western mountains, 1385 ft. above the sea. The surrounding heights, though rugged and barren, produce some of the finest Servian tobacco. Weaving is taught in the girls' school, and fairs are held for the sale of farm produce; but the absence of a railway and the badness of the roads retard commerce. Uzhitse possesses a court of first instance and a prefecture. Despite the prevailing poverty, it has also a real-school with good buildings, founded in 1865, and attended by about 300 pupils in 1900. The houses in Uzhitse are quite unlike those of more prosperous Servian towns, being tall, narrow structures of timber, frequently blackened by the damp. Pop. (1900) about 7000.

Early in the 13th century Uzhitse was the seat of St Sava, the first archbishop, and the patron saint of Servia. The archbishopric was soon removed to Ipek, in Old Servia; but after the Turkish garrison had been expelled in 1862 the city became once more the head of a diocese. At Arilye, 13 m. E.S.E., there is a 13th-century church, dedicated to St Aril, who, according to tradition, was martyred in the 9th century by unconverted Serbs. On the Bosnian frontier, 15 m. W. by N., are the mineral springs of Bayina Bashta (*i.e.* "the Garden Bath"), with Racha monastery close by; and in the neighbourhood is Dobrinye, the home of the Obrenovich family, with a church built by Milosh Obrenovich, called "the Liberator of Servia" (1818–1839).

[1] Perhaps a mistake or an abbreviation for Aram.

UZZIAH (Heb. for "Yah[weh] is [my] strength"), more correctly Azariah (Hebrew for "Yah[weh] helps"), son of Amaziah, grandson of Joash I., and king of Judah (2 Kings xiv. 22, xv. 1–7). Of his long reign of fifty-two years little is recorded. He recovered Elath at the head of the Aelanitic Gulf, evidently in the course of a successful campaign against Edom (a possible reference in Isa. xvi. 1); we read further in 2 Chron. xxvi. of great wars against Philistines, Arabians and Meunim, of building operations in Jerusalem (probably after the attack by Joash), and of political and social reforms. The prosperity which Judah enjoyed during this period (middle of 8th century) is illustrated by the writings of Amos and by the earliest prophecies of Isaiah (*e.g.* ii. 6 sqq.). In his old age Uzziah was a leper (2 Kings xv. 5), and the later history (2 Chron. xxvi. 16 sqq.) regarded this as a punishment for a ritual fault of which the king was guilty; whilst Josephus (*Ant.* ix. 10. 4) records the tradition that on the occasion of his transgression the land was shaken by the terrible earthquake to which Amos i. 1 and Zech. xiv. 5 refer. During Uzziah's seclusion his son Jotham acted as regent. The growing power of Judah, however, aroused the jealousy of Israel, which, after the death of Jeroboam (2), had fallen on evil days (see Menahem). Jotham's victory over Ammon (2 Chron. xxvii. 5) could only increase the hostility, and preparations were made by Israel for an alliance with Damascus which culminated in an attack upon Judah in the time of Jotham's son, Ahaz (*q.v.*).

The identification (Schrader, McCurdy, &c.) of Azariah with Azriyau of Ja'udi, the head of a North Syrian confederation at Hamath (Hamah) overcome by Tiglath-Pileser IV. (738 B.C.), conflicts with the chronological evidence, with what is known of Uzziah's life and policy, and with the historical situations represented in the Biblical narratives (see Winckler, *Alttest. Forschungen* [1893], i. 1–23; S. A. Cook, *Ency. Bib.* col. 5244; Whitehouse, *Dict. Bib.* iv. p. 844 seq.; id. *Isaiah*, p. 9 seq.; Skinner, *Kings*, p. 359). On the other hand, the interrelation of events in Palestine and Syria during this period combine with the sudden prominence of Judah (under Uzziah) and the subsequent anti-Judaean and anti-Assyrian coalition (against Ahaz) to suggest that Uzziah had been supported by Assyria (cf. Winckler, *Keilinschr. u. d. Alte Test.*, 3rd. ed., p. 262). In fact, since the Biblical evidence is admittedly incomplete, and to a certain extent insecure, the question of the identification of Azariah of Judah and Azriyau of Ja'udi may be reopened. See H. M. Haydn, *Journ. of Bibl. Lit.*, xxviii. (1909), pp. 182–199, and artt. Jews, §§ 13 (beginning), 15; Palestine, *Old Test. Hist.* (S. A. C.)

V This letter was originally, like Y, only one of the earlier forms of the letter U. According to Florio (1611) V is "sometimes a vowel, and sometimes a consonant." In modern times attempts have been made to assign to it the consonantal value of U, but in English another symbol W is used for this, while V has received the value of the voiced form of F, which itself had originally a sound resembling the English W (see under F). V is therefore a voiced labio-dental spirant, the breath escaping through a very narrow slit between the lower lip and the upper teeth. In German, however, V is used with the same value as F, while W takes the value that V has in English. Apart from some southern dialect forms which have found their way into the literary language, as *vat* (for *fat* or *wine-fat* which still survives in the English Bible) and *vixen* the feminine of *fox*, all the words in English which begin with V are of foreign, and most of Latin origin. In the middle of words between vowels *f* was originally regularly voiced: *life, lives; wife, wives*, &c. The Latin V, however, was not a labio-dental spirant like the English *v*, but a bi-labial semivowel like the English *w*, as is clear from the testimony of Quintilian and of later grammarians. This quality has remained to it in southern Italy, in Spain and Gascony. In Northern French and in Italian it has become the labio-dental *v*, and from French English has adopted this value for it. Early borrowings like *wine* (Latin *vinum*), *wall* (Latin *vallum*), retain the *w* sound and are therefore spelt with *w*. In the English dialects of Kent, Essex and Norfolk there is a common change of *v* to *w*, but Ellis says (*English Pronunciation*, V, pp. 132, 229) that though he has made diligent search he has never been able to hear the *v* for *w* which is so characteristic of Sam and Tony Weller in the *Pickwick Papers*. It is, however, illustrated in Pegge's *Anecdotes of the English Language* (1803) and confirmed by the editor of the 3rd edition (1844), pp. 65–66. The history of V as the Latin numeral for 5 is uncertain. An old theory is that it represents the hand, while X=10 is the two hands with the finger tips touching. This was adopted by Mommsen (*Hermes*, xxii. 598). The Etruscan used the same *v*-symbol inverted. V with a horizontal line above it was used for 5000. (P. Gi.)

VAAL, a river of South Africa, chief affluent of the Orange (*q.v.*). It rises at an elevation of over 5000 ft. above the sea on the slopes of the Klipstapel, in the Drakensberg mountains, Ermelo district of the Transvaal, and about 170 m. in a direct line west of Delagoa Bay. It flows in a general S.W. direction, with a markedly winding course, across the plateau of inner South Africa, joining the Orange in 29° 3′ S., 23° 36′ E. The river valley is about 500 m. long, the length of the river being some 750 m.

The first considerable tributary is the Klip (80 m. long), which rises in the Draken's Berg (the hill which gives its name to the range) and flows N.W., its junction with the Vaal being in 27° S., 29° 6′ E., 12 m. S.W. of Standerton. From this point to the eastern frontier of the Cape the Vaal forms the boundary between the Orange Free State and the Transvaal. The river is usually shallow and is fordable at many places, known as *drifts*. But after the heavy summer rains the stream attains a depth of 30 or more feet. At such times the banks, which are lined with willows and in places very steep, are inundated. As a rule little water is added to the Vaal by its tributaries. Of these, the Wilge (190 m.), which also rises on the inner slopes of the Drakensberg, flows first S.W., then N.W. across the eastern part of Orange Free State and joins the Vaal 60 m. below the Klip confluence. Lower down the river receives from the south the Rhenoster, Valsch, Vet and other streams which drain the northern part of the Orange Free State. On the north the basin of the Vaal is contracted by the Witwatersrand and Magaliesberg range, and its tributaries are few and, save in the case of the Harts river, short. The Klip, not to be confounded with the southern Klip already described, rises on the south side of the Witwatersrand about 15 m. W. of Johannesburg, is joined by several small streams, and after a S.E. course of 70 m. reaches the Vaal 2 m. E. of Vereeniging. The Klip is of importance in the supply of water to many of the Black Reef gold mines. The Mooi rises in the Witwatersrand west of the Klip and, after running almost due S. 75 m., unites with the main stream about 90 m. below Vereeniging. It gets its name Mooi (Beautiful) on account of the picturesqueness of its banks. Some of its sources are at Wonderfontein, where they issue from stalactite caves. The Harts river (200 m.) rises on the S.W. slopes of the Witwatersrand and flowing S. by W. unites with the Vaal about 65 m. above the confluence of that stream with the Orange. The volume of water in the Harts is often very slight, but that part of the country, the eastern division of Griqualand West, in which the Vaal receives its last tributaries and itself joins the Orange, is the best watered of any of the inland districts of the Cape. The Vaal here flows in a wide rocky channel, with banks 30 ft. high, through an alluvial plain rendered famous in 1867–70 by the discovery of diamonds in the bed of the river and along its banks. The diamonds are washed out by the water and found amid debris of all kinds, frequently embedded in immense boulders. The last affluent of the Vaal, the Riet river, rises in the Beyers Bergen S.E. of Reddersburg and flows N.W. 200 m. through Orange Free State, being joined, a mile or two within the Cape frontier, by the Modder river (175 m.), which rises in the same district as the Riet but takes a more northerly course. The united Riet-Modder joins the Vaal 18 m. above the Orange confluence.

The name Vaal is a partial translation by the Dutch settlers of the Hottentot name of the river—Kai Gariep, properly Garib (yellow water), in reference to the clayey colour of the stream. The Transvaal is so named because the first white immigrants reached the country from the south by crossing the Vaal.

VAALPENS (dusty-bellies), a little-known nomadic people of South Africa, who survive in small groups in the Zoutpansberg and Waterberg districts of the Transvaal, especially along the Magalakwane river. They are akin to the Bushmen (*q.v.*). In 1905 their total number was estimated by the Transvaal military authorities at "a few hundreds." The Vaalpens were so called by the Boers from the dusty look of their bodies, due, it is said, to their habit of crawling along the ground when stalking game. But their true colour is black. In height the men average about 4 ft., *i.e.* somewhat less than the shortest Bushmen. Socially the Vaalpens occupy nearly as low a position as even the Fuegians or the extinct Tasmanians. They were nearly exterminated by the Aman'debele, a tribe of Zulu stock which entered the Transvaal about the beginning of the 19th century. The Vaalpens, who live entirely by hunting and trapping game, dwell in holes, caves or rock-shelters. They wear capes of skins, and procure the few implements they need in exchange for skins, ivory or ostrich feathers. They form family groups of thirty or forty under a chief or patriarch, whose functions are purely domestic, as must be the case where there are no arts or industries, nothing but a knowledge of hunting and of fire with which to cook their meals. Their speech appears to be so full of clicks as to be incapable of expression by any clear phonetic system. Hence it is impossible to say whether the Vaalpens possess any folklore or other oral literature analogous to that of the Bushmen.

VACARESCU, the name, according to tradition, of one of the oldest noble families in Walachia. Its mythical founder is said to have been a certain Kukenus, of Spanish origin, settled in Transylvania as lord over Fogaras. Others connect the family with Ugrin, count of Fogaras. The first member of historical importance was Ianache (b. 1654), the grand treasurer of Walachia, who was killed with his master, Prince Brancovan, in Constantinople, 1714. His grandson through his son Stephan, also called Ianache (or "Enakitza the Ban," 1730–1796), starts a line of Rumanian scholars and poets; he was the author of the first known Rumanian grammar in the vernacular, printed in 1787. While in exile in Nicopolis he wrote the contemporary history of the Turkish empire in two volumes (1740–1799). He was also the first to attempt Rumanian versification. Greater as a poet is his son Alecu (Alexander), who died as a prisoner in Constantinople in 1798. In 1796 a collection of his poems appeared in Rumania. His brother Nikolaes (d. 1830) also wrote some poems, but they remained in MS. until 1860, when they were published. By far the greatest member of the Vacarescu family in the male line was Iancu (1786–1863), the son of Alexander. He received an excellent education not only in Greek but also in German and French, and was well versed in the literature of the West. An ardent patriot, he sided with the national movement in 1821, and assisted in establishing the Rumanian theatre, translating many books and plays from German and French into Rumanian, notably the *Britannicus* of Corneille, a literary event of no small importance at the time. He inaugurated modern Rumanian poetry. In 1830 appeared his first volume of verse. He died in 1863. A niece of Alexander is the gifted writer Elena Vacarescu (Hélène Vacaresco), who inherited the poetical talent of her family and has enriched Rumanian literature with her *Bard of the Dimbovitza*, and other poems and novels in Rumanian and in French. (M. G.)

VACARIUS (1120–1200?), Italian civilian and canonist, the first known teacher of Roman law in England, was doubtless of the school of Bologna, though of a later generation than the hearers of Irnerius. He was brought to Canterbury, possibly by Becket, together with a supply of books upon the civil law, to act as counsel (*causidicus*) to Archbishop Theobald in his struggle, which ended successfully in 1146, to obtain the transfer of the legateship from the bishop of Winchester to himself. We next hear of Vacarius as lecturing at Oxford, in 1149, to "crowds of rich and poor," and as preparing, for the use of the latter, a compendium, in nine books, of the Digest and Code of Justinian, "sufficient," it was said, "if thoroughly mastered, to solve all legal questions commonly debated in the schools." It became a leading text-book in the nascent university, and its popular description as the *Liber pauperum* gave rise to the nickname *pauperistae* applied to Oxford students of law. Nearly complete MSS. of this work are still in existence, notably in the cathedral libraries at Worcester and Prague and in the town library at Bruges. Fragments of it are also preserved in the Bodleian and in several college libraries at Oxford.

The new learning was not destined to make its way without opposition. King Stephen silenced Vacarius, and ordered the destruction of the books of civil and canon law which had been imported by Theobald. The edict to this effect seems, however, not to have been in force after the death of its royal author in 1154 ("eo magis virtus legis invaluit quo eam amplius nitebatur impietas infirmare," Joh. Sarisburiensis). There is ample evidence that the civil law was soon once more a favourite study at Oxford, where we learn that, in 1190, two students from Friesland were wont to divide between them the hours of the night for the purpose of making a copy of the *Liber pauperum*. Whether or no Vacarius ever resumed his Oxford lectures after their interruption by Stephen we are not informed. In any case he was soon called off to practical work, as legal adviser and ecclesiastical judge in the northern province, by his old friend and colleague at Canterbury, Roger de Pont l'Évêque, after the promotion of the latter, in the year of Stephen's death, to the archbishopric of York. Thenceforth the name of "magister Vacarius" is of very frequent occurrence, in papal letters and the chronicles of the period, as acting in these capacities. He was rewarded with a prebend in the collegiate church of secular canons at Southwell, half of which he was allowed in 1191 to cede to his "nephew" Reginald. He is last heard of in 1198, as commissioned, together with the prior of Thurgarton, by Pope Innocent III. to carry into execution, in the north of England, a letter with reference to the crusade. It is doubtless to the second half of the life of Vacarius that the composition must be attributed of two works the MS. of which, formerly the property of the Cistercian Abbey of Biddleston, is now in the Cambridge University library. One of these, *Summa de assumpto homine*, is of a theological character, dealing with the humanity of Christ; the other, *Summa de matrimonio*, is a legal argument, to the effect that the essential fact in marriage is neither, as Gratian maintains, the *copula*, nor, as Peter Lombard, consent by *verba de praesenti*, but mutual *traditio*.

Authorities.—Most of the original authorities are textually set out and annotated by Prof. T. E. Holland in vol. ii. of the *Oxford Historical Society's Collectanea* (1890). Wenck, in his *Magister Vacarius* (1820), prints the prologue, and a table of contents, of the *Liber pauperum*, from a MS. now lost. He returns to the subject in Stieber's *Opuscula academica* (1834). F. Maitland in the *Law Quarterly Review*, xiii. pp. 133, 270 (1897), gives a full account of the Cambridge MSS., printing *in extenso* the *Summa de matrimonio*. See also Muhlenbruch, *Obs. juris Rom.* i. 36; Hänel, in the *Leips. Lit. Zeitung* (1828), No. 42, "Intelligenzblatt," p. 334; Savigny, *Geschichte*, iv. 423; Stolzel, *Lehre von der operis novi denunt.* (1865), pp. 592–620, and in the *Zeitschrift für Rechtsgeschichte*, vi. p. 234; *Catalogue général des MSS. des bibliothèques publiques de France: Départements*, t. x. Lieberman, in the *English Historical Review*, xi. (1906), pp. 305, 514, identified Vacarius with one "Vac." of Mantua, the author of *Contraria legum Longobardorum*, but withdrew this antecedently improbable suggestion (ib. vol. xiii.) after T. Patella had shown, in the *Atti della R. Academia di Torino*, xxxii., that "Vac. Mantuanus," the author of the *Contraria*, must have been "Vacella," who, in 1189, was a judge at Mantua. (T. E. H.)

VACCINATION (from Lat. *vacca*, a cow), the term originally devised for a method of protective inoculation against small-pox, consisting in the intentional transference to the human being of the eruptive disease of cattle called cow-pox (*vaccinia*). The discovery of vaccination is due to Dr Edward Jenner (*q.v.*), at the time a country medical practitioner of Berkeley, in the vale of Gloucester, whose investigations were first published in 1798 in the form of a pamphlet entitled *An Inquiry into the Causes and Effects of the Variolae Vaccinae, &c.* Many years previously, while he was an apprentice to a medical man at Sodbury, near Bristol, his attention was directed to a belief, widely prevalent in Gloucestershire during the latter half of the 18th century, that those persons who in the course of their employment on dairy farms happened to contract cow-pox were thereby protected from a subsequent attack of small-pox. In particular, his interest was aroused by a casual remark made by a young countrywoman who happened to come to the surgery one day for advice, and who, on hearing mention made of small-pox, immediately volunteered the statement that she could not take the disease, as she had had cow-pox. On coming up to London in 1770, to finish his medical education, Jenner became a pupil of John Hunter, with whom he frequently discussed the question of the possibility of obtaining protection against small-pox. On his return to his native village of Berkeley in 1773, to practise as a medical man, he took every opportunity of talking over and investigating the matter, but it was not until May 1796 that he actually began to make experiments. His first case of vaccination was that of a boy eight years of age, named James Phipps, whom he inoculated in the arm with cow-pox matter taken from a sore on the hand of Sarah Nelmes, a dairymaid, who had become infected with the disease by milking cows suffering from cow-pox. It was apparently not until 1798 that he made his first attempt to carry on a strain of lymph from arm to arm. In the spring of that year he inoculated a child with matter taken directly from the nipple of a cow, and from the resulting vesicle on the arm of the child first operated upon, he inoculated, or, as it may now be more correctly termed, "vaccinated," another. From this child several others were vaccinated. From one of these a fourth remove was successfully carried out, and finally a fifth. Four of these children were subsequently inoculated with small-pox—the "variolous test"—without result. The success of many such experiments, in his own hands and in those of his contemporaries, led Jenner to express his belief—a mistaken one, as events have proved—that the protective influence of vaccination would be found to last throughout the lifetime of the person operated on. Obviously he did not realize the fact that the data at his disposal were insufficient for the formation of an accurate judgment on this point, since time alone could prove the exact duration of the protection originally obtained. Subsequent experience has demonstrated that, as has been well said by a writer in the *Edinburgh Review*, "even after efficient vaccination a slow progress away from safety and towards danger is inevitable, and re-vaccination at least once after childhood is necessary if protection is to be maintained."

In applying to cow-pox the term "variolae vaccinae," Jenner gave expression to his belief that this disease was in reality nothing more nor less than small-pox of the cow. But soon it was discovered that if there were such a malady as "small-pox of the cow," there was also, as Dr Loy first satisfactorily demonstrated, a small-pox of the horse, which, under the name of "grease," was resorted to from time to time as a source of vaccine lymph. Jenner had, indeed, put forward the suggestion that "grease" was a necessary antecedent to cow-pox; but even taking this term to have been used by him in the sense of horse-pox, he was, in all probability, mistaken in his assumption. At the same time, however, there can be little doubt that these two diseases are very closely allied, if indeed they be not identical. As evidence of a definite relationship between human small-pox and cow-pox, it may be mentioned that whereas, prior to the introduction of vaccination, epidemics of these disorders frequently arose concurrently, the so-called "natural" cow-pox has now in great measure disappeared. There is, moreover, no appreciable difference in the minute anatomical appearances characteristic of the eruption following on inoculation of one or other of these two affections in the human subject. But of far greater importance in this connexion are the results obtained by numerous observers who, in various parts of the world, and almost from the time of Jenner onwards, have set themselves the task of attempting, by experimental methods, to solve the problem of the true relationship of variola to vaccinia. As the outcome of this work it may now be definitely stated that small-pox lymph, more especially, as the present writer has shown, if obtained from the primary vesicle of a case of the inoculated form of the disease, by passage through the system of the calf can be so altered in character as to become deprived of its power of causing a generalized eruption, while inducing at the site of inoculation a vesicle indistinguishable from a typical vaccine vesicle; and, more important still, that when transferred again to man, it has by such treatment completely lost its former infectious character. Such being the case, it may fairly be asserted that cow-pox, or rather that artificially inoculated form of the disease which we term *vaccinia*, is nothing more nor less than *variola* modified by transmission through the bovine animal. An outbreak of small-pox, indeed, may be turned to account for raising, by appropriate experimental methods, a fresh stock of vaccine lymph.

Relationship of small-pox and cow-pox.

There is much evidence to prove that the results following on vaccination are due to a specific contagium, and, moreover, that the particular micro-organism concerned is capable of existing, during one period of its life-cycle, in a resting or spore form, in which condition it is more resistant to the germicidal effects of glycerine than is the case with non-sporing microbes. Advantage is taken of this fact, in the method devised by the present writer, and now employed officially in England, as also on the Continent and in America, for ensuring the bacteriological purity of vaccine lymph. Up to the present, unfortunately, no satisfactory method has been discovered by which the micro-organism of vaccinia can be unfailingly cultivated on artificial media while still retaining its specific properties.

Bacteriology.

The publication in 1896 of the final report of the English Royal Commission on Vaccination, in which the various phases of the vaccination question are discussed on the basis of evidence obtained from witnesses of all shades of opinion during a period extending over no less than six years, considerably simplifies the task of dealing with this subject. The Royal Commission, originally numbering fifteen members,[1] with Lord Herschell as president, was appointed in May 1889, the terms of reference being as follows: "To inquire and report as to—(1) The effect of vaccination in reducing the prevalence of, and mortality from, small-pox. (2) What means, other than vaccination, can be used for diminishing the prevalence of small-pox; and how far such means could be relied on in place of vaccination. (3) The objections made to vaccination on the ground of injurious effects alleged to result therefrom; and the nature and extent of any injurious effects which do, in fact, so result. (4) Whether any, and, if so, what means should be adopted for preventing or lessening the ill effects, if any, resulting from vaccination; and whether, and, if so, by what means, vaccination with animal vaccine should be further facilitated as a part of public vaccination. (5) Whether any alterations should be made in the arrangements and proceedings for securing the performance of vaccination, and, in particular, in the provisions of the Vaccination Acts with respect to prosecutions for non-compliance with the law."

Vaccination Commission, 1889-96.

The evidence given before the Royal Commission was published at intervals in a series of Blue-books, but, as stated, it was not until August 1896 that the final report made its appearance. As regards the effect of vaccination in reducing the prevalence of, and mortality from, small-pox, the following conclusions were arrived at, Dr Collins and Mr Picton alone dissenting: "(1) That it diminishes the liability to be attacked by the disease. (2) That it modifies the character of the disease and renders it (*a*) less fatal, and (*b*) of a milder or less severe type. (3) That the protection it affords against attacks of the disease is greatest during the years immediately succeeding the operation of vaccination. It is impossible to fix with precision the length of this period of highest protection. Though not in all cases the same, if a period is to be fixed, it might, we think, fairly be said to cover in general a period of nine or ten years. (4) That after the lapse of the period of highest protective potency, the efficacy of vaccination to protect against attack rapidly diminishes, but that it is still considerable in the next quinquennium, and possibly never altogether ceases. (5) That its power to modify the character of the disease is also greatest in the period in which its power to protect from attack is greatest, but that its power thus to modify the disease does not diminish as rapidly as its protective influence against attacks, and its efficacy, during the later periods of life, to modify the disease is still very considerable. (6) That re-vaccination restores the protection which lapse of time has diminished, but the evidence shows that this protection again diminishes, and that, to ensure the highest degree of protection which vaccination can give, the operation should be at intervals repeated. (7) That the beneficial effects of vaccination are most experienced by those in whose case it has been most thorough. We think it may fairly be concluded that where the vaccine matter is inserted in three or four places, it is more effectual than when introduced into one or two places only, and that if the vaccination marks are of an area of half a square inch, they indicate a better state of protection than if their area be at all considerably below this."

For the evidence, statistical or otherwise, on which these conclusions are based, the Reports of the Royal Commission should be consulted. But reference may here be made to two facts of which proof is overwhelming. (1) Small-pox, in pre-vaccination days a disease of infancy and childhood—like measles at the present day—has in the United Kingdom become a disease mainly of adults. The shifting of age-incidence can only be accounted for by the custom of vaccination in infancy. To this day, when small-pox attacks young unvaccinated children, it is found to be as virulent as, or even more virulent than, small-pox in the unvaccinated at higher ages. On the other hand, small-pox is practically unknown among well-vaccinated children. When, quite exceptionally, such children have been attacked, the disease has been so trivial in character as to be liable to escape recognition altogether. (2) Medical men, nurses and other persons exposed to the disease habitually protect themselves by efficient re-vaccination, and when this precaution has been taken, never contract small-pox.

The clinical activity and bacteriological purity of the lymph employed for vaccination; the skilful performance of the operation itself; the making an adequate number of insertions of lymph over a sufficient area; the observance of precautions needful for ensuring strict asepsis, both at the time of vaccination and subsequently until the vaccination wounds are soundly healed—all these are matters to be regarded as essential to "efficient vaccination." Certain principles in respect of them are generally recognized, and in the case of public vaccinators, whose work comes under government inspection, a series of instructions on these several points are prescribed by the Local Government Board. First in regard to lymph. That which is now almost universally employed in Great Britain is glycerinated calf lymph, the use of which has entirely superseded, in public vaccinations, the arm-to-arm method which for many years previously had been employed as the best means then attainable

Efficient vaccination.

[1] The original Commissioners were—Lord Herschell, C. Bradlaugh, Dr Bristowe, Dr Collins, Sir C. Dalrymple, J. S. Dugdale, Q.C., Prof. M. Foster, Sir E. H. Galsworthy, Sir Guyer Hunter, J. Hutchinson, Sir James Paget, J. A. Picton, Sir William Savory, S. Whitbread, F. Meadows White, Q.C. Mr Bradlaugh, Dr Bristowe and Sir William Savory died during the progress of the inquiry. Only one of the vacancies thus caused was filled up, Mr J. A. Bright having been appointed on the death of Mr Bradlaugh.

of ensuring the activity and comparative purity of the lymph. Glycerinated lymph, under proper conditions, usually retains its potency for many weeks or months; but nevertheless, in certain circumstances at present imperfectly understood, is liable to become gradually weakened, and even eventually to become altogether inert. Possibly the condition of the calves from which the lymph is obtained, especially as regards their general health and the suppleness or the reverse of their skins, or exposure of the lymph to the action of light or to a high temperature, are of special importance. Consequently, in order to ensure the best results from its use, it is not only necessary that great care should be exercised in its manufacture, but it is also advisable that the lymph should be employed for vaccination as soon as possible after bacteriological examination has demonstrated its freedom from suppurative and other extraneous micro-organisms. As regards the carrying out of the operation itself, it is somewhat unfortunate that there exists no official definition of what constitutes a "successful vaccination," and in consequence it is open to any practitioner to give a certificate of successful vaccination in cases where but one minute vesicle may have been produced. It is to be feared that such certificates are too frequently given, and it cannot be too strongly urged that vaccination of this sort involves incomplete protection. The standard laid down by the Local Government Board—the production, namely, of a total area of vesiculation of not less than half a square inch, divided among four separate vesicles or groups of vesicles, not less than half an inch from one another—has for the most part proved easily attainable in practice, and it is much to be desired that in private as in public work the attainment of this standard should be aimed at in every instance.

The protection afforded by a primary vaccination tends gradually to diminish, and eventually to disappear more or less completely, with the lapse of time. In consequence, it is desirable that the operation should be repeated at the age of from seven to ten years, and thereafter, if it be possible, at intervals during later life. The final report of the Royal Commission thus summarizes the evidence as to the value of such additional procedure:—

"Where re-vaccinated persons were attacked by, or died from, small-pox, the re-vaccination had for the most part been performed a considerable number of years before the attack. There were very few cases where a short period only had elapsed between the re-vaccination and the attack of small-pox. This seems to show that it is of importance, in the case of any persons specially exposed to the risk of contagion, that they should be re-vaccinated, and that in the case even of those who have been twice re-vaccinated with success, if a long interval since the last operation has elapsed, the operation should be repeated for a third, and even a fourth time."

It not unfrequently happens that in the case of a re-vaccination the process runs a somewhat different course from that witnessed in a typical primary vaccination. In a successful re-vaccination, the site of the operation may be distinctly reddened and somewhat irritable by the second day, while papules will probably make their appearance about the third to the fifth day. The papules may or may not develop further into vesicles and pustules. Occasionally a re-vaccination appears to fail altogether; but, as pointed out by the Royal Commission, it is advisable, as in the case of a primary vaccination, to make further attempts with lymph of known potency before concluding that the individual is really insusceptible.

Alleged injurious effects.

In a certain small proportion of cases the operation of vaccination has been followed, after a longer or shorter interval, by various complications, of which by far the most important are those of an inflammatory nature, such as erysipelas, which are not peculiar to vaccination, but which constitute the danger of any local lesion of the skin, however caused. During the many decades in which vaccination from arm to arm was practised, in many millions of children, a few authenticated cases were recorded in which there was reason to believe that syphilis could have been invaccinated. Such an occurrence could at no time have happened if proper care had been taken by the vaccinator; and now that the use of calf lymph has become practically universal, the possibility of such occurrence in the future may be disregarded, since the calf is not capable of contracting this disease. Tubercle in its various forms and leprosy have also been included in the list of possible complications of vaccination, though without any sufficient proof. The employment of calf lymph, treated with glycerine after the manner first advocated by S. Monckton Copeman, will obviate any such danger, for even if tubercle bacilli or the streptococcus of erysipelas were by chance present in the lymph material when collected, it has been found experimentally that they are quite unable to survive prolonged exposure to the action of a 50% solution of glycerine in water. Leprosy is not communicable to the calf. In view of the frequency of various skin eruptions in infancy, it is to be expected that in a proportion of cases they will appear during the weeks following vaccination. Eczema and impetigo in particular have, *post hoc*, been attributed to vaccination, but no direct connexion has been proved to exist between the operation and the occurrence of these disorders. In section 434 of the final report of the Royal Commission on Vaccination the extent to which other inoculable diseases are liable to complicate vaccination is thus summed up:—

"A careful examination of the facts which have been brought under our notice has enabled us to arrive at the conclusion that although some of the dangers said to attend vaccination are undoubtedly real, and not inconsiderable in gross amount, yet when considered in relation to the extent of vaccination work done, they are insignificant. There is reason, further, to believe that they are diminishing under the better precautions of the present day, and with the additions of the future precautions which experience suggests, will do so still more in the future." (S. M. C.)

Compulsory vaccination.

Legislation making vaccination *compulsory* was first introduced in Bavaria (1807), Denmark (1810), Sweden (1814), Württemburg, Hesse and other German states (1818), Prussia (1835), the United Kingdom (1853), German empire (1874), Rumania (1874), Hungary (1876), Servia (1881), Austria (1886). But in many cases there had been earlier provisions indirectly making it necessary. In the same way, though there is no federal compulsory law in Switzerland, most of the cantons enforce it; and though there is no statutory compulsion in France, Italy, Spain, Portugal, Belgium, Norway, Russia or Turkey, there are government facilities and indirect pressure, apart from the early popularity of vaccination which made it the usual practice. In the United States there is no federal law, but many of the separate states make their own compulsion either directly or indirectly, Massachusetts starting in 1809.

English legislation.

The benefit of vaccination proved itself in the eyes of the world by its apparent success in stamping out small-pox; but there continued to be people, even of the highest competence, who regarded this as a fallacious argument—*post hoc, ergo propter hoc.* The cause of "anti-vaccination" has had many followers in England, and their persistence has had important effect in English legislation. Under the provisions of the Vaccination Act 1898, and of the Vaccination Order (1898) of the Local Government Board, with some minor changes in succeeding acts, numerous changes in connexion with vaccination administration and with the performance of the operation were introduced, in addition to the supersession of arm-to-arm vaccination, by the use of glycerinated calf lymph. Thus, whereas by the Vaccination Acts of 1867 and 1871 the parent or person having the custody of any child was required to procure its vaccination within three months of birth, this period by the act of 1898 was extended to six months. Again, parents were relieved of any penalty under the compulsory clauses of the Vaccination Acts who afforded proof that they had, within four months of the birth of a child, satisfied a stipendiary magistrate, or two justices in petty sessions, that they conscientiously believed that vaccination would be prejudicial to the health of the child. Moreover, proceedings were not to be taken more than twice against a defaulting parent, namely, once under section 29 of the act of 1867, and once under section 31 of the same act, provided that the child had reached the age of four years. Finally, the public vaccinator was now required to visit the homes of children for the purpose of offering vaccination with glycerinated calf lymph, "or such other lymph as may be issued by the Local Government Board." The operative procedure in public vaccinations was formerly based on the necessity of carrying on a weekly series of transferences of vaccine lymph from arm to arm; and for the purposes of such arm-to-arm vaccination the provision of stations, to which children were brought first for the performance of the operation, and again, after a week's interval, for inspection of the results, was an essential. The occasional hardships to the mothers, and a somewhat remote possibility of danger to the children, involved in being taken long journeys to a vaccination station in bad weather, or arising from the collecting together in one room of a number of children and adults, one or more of whom might happen to be suffering at the time from some infectious disorder, are a few of the reasons which appeared to render a change in this regulation desirable; as a matter of fact, it would appear that nothing but good has arisen from the substitution of domiciliary for stational vaccination. There have naturally been some curious discussions before the magistrates as to what is "conscientious" or not, but the working of the so-called "conscience clause" by no means justified the somewhat gloomy forebodings expressed, both in Parliament and elsewhere, at the time of its incorporation in the act of 1898. On the contrary, its operation appeared to tend to the more harmonious working of the Vaccination Acts, by affording a legal method of relief to such parents and guardians as were prepared to affirm that they had a conscientious belief that the performance of the operation might, in any particular instance, be prejudicial to the health of the child.

Royal Med. and Chir. Society* (1901–2); M'Vail, "Criticism of the Dissentient Commissioners' Report," *Trans. Epidemiological Society* (1897); Reports of the Royal Commission on Vaccination (1889–1896); "The History and Effects of Vaccination," *Edinburgh Review*, No. 388 (1899); *Vaccination Law of German Empire* (Berlin, 1904).

VACHEROT, ÉTIENNE (1809–1897), French philosophical writer, was born of peasant parentage at Torcenay, near Langres, on the 29th of July 1809. He was educated at the École Normale, and returned thither as director of studies in 1838, after some years spent in provincial schoolmasterships. In 1839 he succeeded his master Cousin as professor of philosophy at the Sorbonne. His *Histoire critique de l'école d'Alexandrie* (3 vols. 1846–51), his first and best-known work, drew on him attacks from the Clerical party which led to his suspension in 1851. Shortly afterwards he refused to swear allegiance to the new imperial government, and was dismissed the service. His work *Démocratie* (1859) led to a political prosecution and imprisonment. In 1868 he was elected to the French Academy. On the fall of the Empire he took an active part in politics, was *maire* of a district of Paris during the siege, and in 1871 was in the National Assembly, voting as a Moderate Liberal. In 1873 he drew nearer the Conservatives, after which he was never again successful as a parliamentary candidate, though he maintained his principles vigorously in the press. He died on the 28th of July 1897. Vacherot was a man of high character and adhered strictly to his principles, which were generally opposed to those of the party in power. His chief philosophical importance consists in the fact that he was a leader in the attempt to revivify French philosophy by the new thought of Germany, to which he had been introduced by Cousin, but of which he never had more than a second-hand knowledge. Metaphysics he held to be based on psychology. He maintains the unity and freedom of the soul, and the absolute obligation of the moral law. In religion, which was his main interest, he was much influenced by Hegel, and appears somewhat in the ambiguous position of a sceptic anxious to believe. He sees insoluble contradictions in every mode of conceiving God as real, yet he advocates religious belief, though the object of that belief have but an abstract or imaginary existence.

His other works are: *La Métaphysique et la science* (1858), *Essais de philosophie critique* (1864), *La Religion* (1869), *La Science et la conscience* (1870), *Le Nouveau Spiritualisme* (1884), *La Démocratie libérale* (1892).

See Ollé Laprune, *Étienne Vacherot* (Paris, 1898).

VACQUERIE, AUGUSTE (1819–1895), French journalist and man of letters, was born at Villequier (Seine Inférieure) on the 19th of November 1819. He was from his earliest days an admirer of Victor Hugo, with whom he was connected by the marriage of his brother Charles with Léopoldine Hugo. His earlier romantic productions include a volume of poems, *L'Enfer de l'esprit* (1840); a translation of the *Antigone* (1844) in collaboration with Paul Meurice; and *Tragaldabas* (1848), a melodrama. He was one of the principal contributors to the *Événement* and followed Hugo into his exile in Jersey. In 1869 he returned to Paris, and with Paul Meurice and others founded the anti-imperial *Rappel*. His articles in this paper were more than once the occasion of legal proceedings. After 1870 he became editor. Other of his works are *Souvent homme varie* (1859), a comedy in verse; *Jean Baudry* (1863), the most successful of his plays; *Aujourd'hui et demain* (1875); *Futura* (1900), poems on philosophical and humanitarian subjects. Vacquerie died in Paris on the 19th of February 1895. He published a collected edition of his plays in 1879.

VACUUM-CLEANER, an appliance for removing dust from carpets, curtains, &c., by suction, and consisting essentially of some form of air-pump drawing air through a nozzle which is passed over the material that has to be cleaned. The dust is carried away with the air-stream and is separated by filtration through screens of muslin or other suitable fabric, sometimes with the aid of a series of baffle-plates which cause the heavier particles to fall to the bottom of the collecting receptacle by gravity. In the last decade of the 19th century compressed air came into use for the purpose of removing dust from railway carriages, but it was found difficult to arrange for the collection of the dust that was blown out by the jets of air, and in consequence recourse was had to working by suction. From this beginning several types of vacuum cleaner have developed.

In the first instance the plants were portable, consisting of a pump driven by a petrol engine or electric motor, and were periodically taken round to houses, offices &c., when cleaning was required. The second stage was represented by the permanent installation of central plants in large buildings, with a system of pipes running to all floors, like gas or water pipes, and provided at convenient points with valves to which could be attached flexible hose terminating in the actual cleaning tools. The vacuum thus rendered available is in some cases utilized for washing the floors in combination with another system of piping connected to a tank containing soap and water, which having been sprayed over the floor by compressed air is removed with the dirt it contains and discharged into the sewers; or in a simpler arrangement the soap and water is contained in a portable tank from which it is distributed, to be sucked up by means of the vacuum as before. In their third stage vacuum cleaners have become ordinary household implements, in substitution for, or in addition to the broom and duster, and small machines are now made in a variety of forms, driven by hand, by foot, or by an electric motor attached to the lighting circuit. In addition to their domestic uses, other applications have been found for them, as for instance in removing dust from printers' type-cases.

VACUUM TUBE. The phenomena associated with the passage of electricity through gases at low pressures have attracted the attention of physicists ever since the invention of the frictional electrical machine first placed at their disposal a means of producing a more or less continuous flow of electricity through vessels from which the air had been partially exhausted. In recent years the importance of the subject in connexion with the theory of electricity has been fully realized; indeed, the modern theory of electricity is based upon ideas which have been obtained from the study of the electric discharge through gases. Most of the important principles deduced from these investigations are given in the article Conduction, Electric (*Through Gases*); here we shall confine ourselves to the consideration of the more striking features of the luminous phenomena observed when electricity passes through a luminous gas.

Methods of producing the Discharge.—To send the current through the gas it is necessary to produce between electrodes in the gas a large difference of potential. Unless the electrodes are of the very special type known as Wehnelt electrodes, this difference of potential is never less than 200 or 300 volts and may rise to almost any value, as it depends on the pressure of the gas and the size of the tube. In very many cases by far the most convenient method of producing this difference of potential is by means of an induction coil; there are some cases, however, when the induction coil is not suitable, the discharge from a coil being intermittent, so that at some times there is a large current going through the tube, while at others there is none at all, and certain kinds of measurement cannot be made under these conditions. Not only is the current intermittent, but it is apt with the coil to be sometimes in one direction and sometimes in the opposite; there is a tendency to send a discharge through the tube not only when the current through the primary is started but also when it is stopped. These discharges are in opposite directions, and though that produced by stopping the current is more intense than that due to starting it, the latter may be quite appreciable. The reversal of the current may be remedied by inserting in series with the discharge tube a piece of apparatus known as a "rectifier" which allows a current to pass through it in one direction but not in the opposite. A common type of rectifier is another tube containing gas at a low pressure and having one of its electrodes very large and the other very small; a current passes much more easily through such a tube from the small to the large electrode than in the opposite direction. Sometimes an air-break inserted in the circuit with a point for one electrode and a disk for the other is sufficient to prevent the reversal of the current without the aid of any other rectifier.

There are cases, however, when the inevitable intermittence of the discharge produced by an induction coil is a fatal objection. When this is so, the potential difference may be produced by a battery of a large number of voltaic cells, of which the most convenient type, where more than a few milli-ampères of current are required, are small storage cells. As each of these cells only produces a potential difference of two volts, a very large number of cells are required when potential differences of thousands of volts have to be produced, and the expense of this method becomes prohibitive. When continuous currents at these high potential differences are rquired, electrostatic induction machines are most generally used. By means of Wimshurst machines, with many plates, or the more recent Wehrsen machines, considerable currents can be produced and maintained at a very constant value.

The exhaustion of the tubes can, by the aid of modern mercury pumps, such as the Töpler pump or the very convenient automatic Gaede pump, be carried to such a point that the pressure of the residual gas is less than a millionth of the atmospheric pressure. For very high exhaustions, however, the best and quickest method is that introduced by Sir James Dewar. In this method a tube containing small pieces of dense charcoal (that made from the shells of coco-nuts does very well) is fused on to the tube to be exhausted. The preliminary exhaustion is done by means of a water-pump which reduces the pressure to that due to a few millimetres of mercury and the charcoal strongly heated at this low pressure to drive off any gases it may have absorbed. The tube is then disconnected from the water-pump and the charcoal tube surrounded by liquid air; the cold charcoal greedily absorbs most gases and removes them from the tube. In this way much higher exhaustions can be obtained than is possible by means of mercury pumps; it has the advantage, too, of getting rid of the mercury vapour which is always present when the exhaustion is produced by mercury pumps. Charcoal does not absorb much helium even when cooled to the temperature of liquid air, so that the method fails in the case of this gas; the absorption of hydrogen, too, is slower than that of other gases. Both helium and hydrogen are vigorously absorbed when the charcoal is cooled to the temperature of liquid hydrogen.

When first the discharge is sent through an exhausted tube, a considerable amount of gas (chiefly hydrogen and carbon monoxide) is liberated from the electrodes and the walls of the tube, so that to obtain permanent high vacua the exhaustion must be continued until the discharge has been going through the tube for a considerable time. One of the greatest difficulties experienced in getting these high vacua is that even when all the joints are carefully made there may be very small holes in the tube through which the air is continually leaking from outside, and when the hole is very small it is sometimes very difficult to locate the leak. The writer has found that a method due to Goldstein is of the greatest service for this purpose. In this method one of the electrodes in the tube and one of the terminals of the induction coil are put to earth, and the pressure of the gas in the tube is reduced so that a discharge would pass through the tube with a small potential difference. The point of an insulated wire attached to the other terminal of the induction coil is then passed over the *outside* of the tube. When it comes to the hole, a very bright white spark may be seen passing through the glass, and in this way the leak located. The appearance of the discharge when the exhaustion is going on is a very good indication as to whether there is any leakage in the tube or not. If the colour of the discharge remains persistently red in spite of continued pumping, there is pretty surely a leak in the tube, as the red colour is probably due to the continued influx of air into the tube. Platinum is the only metal which can be fused through the glass with any certainty that the contact between the glass and the metal will be close enough to prevent air leaking into the tube. Platinum, however, when used as a cathode at low pressures "sputters," and the walls of the tube get covered with a thin deposit of the metal: to avoid this, the platinum is often fastened to a piece of aluminium, which does not sputter nearly so much. Tantalum is also said to possess this property, and it has the advantage of being much less fusible than aluminium. This sputtering depends to some extent on the kind of gases present in the tube, as in monatomic gases, such as mercury vapour, even aluminium sputters badly.

Electrodeless Tubes.—As some gases, such as chlorine and bromine, attack all metals, it is impossible to use metallic electrodes when the discharge through these gases has to be investigated. In these cases "electrodeless" tubes are sometimes used. These are of two kinds. The more usual one is when tin-foil is placed at the ends of the tube on the outside, and the terminals of the induction coil connected with these pieces of foil; the glass under the foil virtually acts as an electrode. A more interesting form of the electrodeless discharge is what is known as the "ring" discharge. The tube in this case is placed inside a wire solenoid which forms a part of a circuit connecting the outside coatings of two Leyden jars, the inside coatings of these jars being connected with the terminals of an induction coil or electrical machine; the jars are charged up by the machine, and are discharged when sparks pass between its terminals. As the discharge of the jars is oscillatory (see ELECTRIC WAVES), electric currents surge through the solenoid surrounding the discharge tube, and these currents reverse their direction hundreds of thousands of times per second. We may compare the solenoid with the primary coil of an induction coil, and the exhausted bulb with the secondary; the rapidly alternating currents in the primary induce currents in the secondary which show themselves as a luminous ring inside the tube. Very bright discharges may be obtained in this way, and the method is especially suitable for spectroscopic purposes (see *Phil. Mag.* [5], 32, pp. 321, 445).

Appearance of the Discharge in Vacuum Tubes.—Fig. 15 b of the article CONDUCTION, ELECTRIC (*Through Gases*) represents the appearance of the discharge when the pressure in the tube is comparable with that due to a millimetre of mercury and for a particular intensity of current. With variations in the pressure or the current some of these features may disappear or be modified. Beginning at the negative electrode *k*, we meet with the following phenomena: A velvety glow runs, often in irregular patches, over the surface of the cathode; this glow is often called the first negative layer. The spectrum of this layer is a bright line spectrum, and Stark has shown that it shows the Döppler effect due to the rapid motion of the luminous particles towards the cathode. Next to this there is a comparatively dark region known as the "Crookes' dark space," or the second negative layer. The luminous boundary of this dark space is approximately such as would be got by tracing the locus of the extremities of normals of constant length drawn from the negative electrode; thus if the electrode is a disk, the luminous boundary of the dark sphere is nearly plain over a part of its surface as in fig. 1, while if the electrode is a ring of wire (fig. 2) the luminous boundary resembles that

Fig. 1.

shown in fig. 17 of the article Conduction, Electric (*Through Gases*). The length of the dark space depends on the pressure of the gas and on the intensity of the current passing through it. The width of the dark space increases as the pressure diminishes, and may, according to the experiments of Aston (*Pro. Roy. Soc.* 79, p. 81), be represented with considerable accuracy by the expression $a+b/p$ or $a+c\lambda$, where a, b, c are constants, p the pressure and λ the mean free path of a corpuscle through the gas. The thickness of the dark space is larger than this free path; for hydrogen, for example, the value of c is about 4.

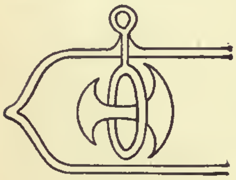

Fig. 2.

When the current is so large that the whole of the cathode is covered with glow the width of the dark space depends upon the current decreasing as the current increases. In helium and hydrogen Aston (*Pro. Roy. Soc.* 80 A., p. 45) has detected the existence of another thin dark space quite close to the cathode whose thickness is independent of the pressure. The farther boundary of the Crookes' dark space is luminous and is known as the negative glow or the third negative layer. Until the current gets so large that the glow next the cathode covers the whole of its surface the potential difference between the cathode and the negative glow is independent of the pressure of the gas and the current passing through it; it depends only on the kind of gas and the metal of which the cathode is made. This difference of potential is known as the cathode fall of potential; the values of it in volts for some gases and electrodes as determined by Mey (*Verh. deuts. Phys. Ges.*, 1903, v. p. 72) are given in the table.

Cathode Fall

Gas	Electrode										
	Pt	Hg	Ag	Cu	Fe	Zn	Al	Mg	Na	Na-K	K
O_2	369	..	..	..	..	..	..	..	..	..	—
H_2	300	..	295	280	230	213	190	168	185	169	172
N_2	232	226	..	..	..	..	..	207	178	125	170
He	226	..	..	..	..	..	..	..	80	78·5	69
Arg	167	..	..	..	..	..	100	..	..	..	—

The cathode fall of potential measures the smallest difference of potential which can produce a spark through the gas. Thus, for example, it is not possible to produce a spark through nitrogen with platinum electrodes with a potential difference of less than 232 volts, except when the electrodes are placed so close together that with a smaller potential difference the electric force between the terminals amounts to more than a million volts per centimetre; for this to be the case the distance between the electrodes must be comparable with the wave-length of sodium light.

When the current is small the glow next the cathode does not cover the whole of the surface, and when this occurs an increase in the current causes the glow to cover a greater area, but does not increase the current density nor the cathode fall. When the current is so much increased that the glow covers the whole of the cathode an increase in current must result in an increase of the current density over the cathode, and this is accomplished by a rapid increase in the cathode fall of potential. The cathode fall in this case has been investigated by Stark (*Phys. Zeit.* 111, p. 274), who finds that its value K can be represented by the equation

$$K=K_n+k(C-xpf)^{\frac{1}{2}}/pf^{\frac{1}{2}},$$

where K_n is the normal cathode fall, f the area of the cathode, C the current through the tube, p the pressure of the gas and k and x constants.

The increase in the potential fall is much more marked in small tubes than in large ones, as with small tubes the formation of the negative glow is restricted; this gives rise to a greater concentration of the current at the cathode and an increase in the cathode fall. The intensity of the electric field in the dark space has been measured by many observers. Aston used very large plain cathodes and measured the electric force by observing the deflection of a small pencil of cathode rays sent across the dark space at different distances from the cathode. He found that the magnitude of the force at a point in the dark space was proportional to the distance of the point from the junction of the negative glow and the dark space. This law of force shows that positive electricity must be in excess in the dark space, and that the density of the electrification must be constant throughout that space. The force inside the negative glow if not absolutely zero is so small that no one has as yet succeeded in measuring it; thus the surface of this glow must be very approximately an equi-potential surface. In the dark space there is a stream of positively electrified particles moving towards the cathode and of negatively electrified corpuscles moving away from it, these streams being mutually dependent; the impact of the positive particles against the cathode gives rise to the emission of corpuscles from the cathode; these, after acquiring kinetic energy in the dark space, ionize the gas and produce the positive ions which are attracted by the cathode and give rise to a fresh supply of corpuscles. The corpuscles which carry the negative electricity are very different from the carriers of the positive; the former have a mass of only $\frac{1}{1700}$ of the atom of hydrogen, while the mass of the latter is never less than that of this atom.

The stream of positive particles towards the cathode is often called the *Canalstrahlen*, and may be investigated by allowing the stream to flow through a hole in the cathode and then measuring, by the methods described in Conduction, Electric (*Through Gases*), the velocity and the value of e/m when e is the charge on a carrier and m its mass. It has been found that this stream is somewhat complex and consists of—

α. A stream of neutral particles.

β. A stream of positively electrified particles moving with a constant velocity of 2×10^8 cm./sec., and having $e/m=10^4$. This is a secondary stream produced by the passage of α through the gas, and it is very small when the pressure of the gas is low.

γ. Streams of positively electrified atoms and perhaps molecules of the gases in the tube. The velocity of these depends upon the cathode fall of potential.

The streams of negative corpuscles and positive particles produce different kinds of phosphorescence when they strike against a solid obstacle. The difference is especially marked when they strike against lithium chloride. The corpuscles make it phosphoresce with a steely blue light giving a continuous spectrum; the positive particles, on the other hand, make it shine with a bright red light giving in the spectroscope the red lithium line. This affords a convenient method of investigating the rays; for example, the distribution of the positive stream over the cathode is readily studied by covering the cathode with fused lithium chloride and observing the distribution of the red glow. Goldstein has observed that the film of metal which is deposited on the sides of the tube through the sputtering of the cathode is quickly dissipated when the positive stream impinges on it. This suggests that the sputtering of the cathode is caused by the impact against it of the positive stream. This view is supported by the fact that the sputtering is not very copious until the increase in the current produces a large increase in the cathode fall of potential. The magnitude of the potential fall and the length of the dark space are determined by the condition that the positive particles when they strike against the cathode must give to it sufficient energy to liberate the number of cathode particles which produce, when they ionize the gas, sufficient positive particles to carry this amount of energy. Thus the cathode fall may be regarded as existing to make the cathode emit negative corpuscles. If the cathode can be made to emit corpuscles by other means, the cathode fall of potential is not required and may disappear. Now Wehnelt (*Ann. Phys.*, 1904, 14, p. 425), found that when lime or barium oxide is heated to redness large quantities of negative corpuscles are emitted; hence if a cathode is covered with one of these substances and made red hot it can emit corpuscles without the assistance of an electric field, and we find that in this case the cathode fall of potential disappears, and current can be sent through the gas with very much smaller differences of potential than with cold cathodes. With these hot cathodes a luminous current can under favourable circumstances be sent through a gas with a potential difference as small as 18 volts.

The dimensions of the parts of the discharge we have been considering—the dark space and the negative glow—depend essentially upon the pressure of the gas and the shape of the cathode, and do not increase when the distance between the anode and cathode is increased. The dimensions of the other part of the discharge which reaches to the anode and is called the positive column depends upon the length of the tube, and in long tubes constitutes by far the greater part of the discharge. This positive column is separated from the negative glow by a dark interval generally known as the Faraday dark space; the dimensions of this dark interval are very variable—it is sometimes altogether absent.

The positive column assumes a considerable variety of forms as the current through the gas and the pressure are varied: sometimes it is a column of uniform luminosity, at others it breaks up into a series of bright and dark patches known as striations. Some examples of these are given in fig. 17 of CONDUCTION, ELECTRIC (*Through Gases*). The distance between the striations varies with the pressure of the gas and the diameter of the tube, the bright parts being more widely separated when the pressure is low and the diameter of the tube large, than when the pressure is high and the tube small. The striations are especially brilliant and steady when a Wehnelt cathode covered with hot lime is used and the discharge produced by a number of storage cells; by this means large currents can be sent through the tube, resulting in very brilliant striations. When the current is increased the positive column shortens, retreating backwards towards the anode, and may, by using very low currents, be reduced to a glow over the surface of the anode. The electric force in the positive column has been measured by many observers. It is small compared with the forces which exist in the dark space; when the luminosity in the positive column is uniform, the force there is uniform; when the positive column is striated there are periodic variations in the electric force, the force being greater in the bright parts of the striation than in the dark.

Anode Drop of Potential.—Skinner (*Wied. Ann.* 68, p. 752; *Phil. Mag.* [6], 8, p. 387) has shown that there is a sudden change in potential between the anode itself and a point in the gas close to the anode. This change amounts to about 20 volts in air; it is thus much smaller than the cathode fall of potential, and it is also much more abrupt. There does not seem to be any region at the anode comparable in dimensions with the Crookes' dark space in which the drop of potential occurs.

The highly differentiated structure we have described is not the only way in which the current can pass through the tube. If a large Leyden jar is suddenly discharged through the tube the discharge passes as a uniform, continuous column stretching without interruption from anode to cathode; Goldstein has shown (*Verh. deutsch. phys. Ges.* 9, p. 321) that the spectrum of this discharge shows very interesting characteristics. (J. J. T.)

VÁCZ (Ger. *Waitzen*), a town of Hungary, in the county of Pest-Pilis-Solt-Kis-Kun, 20 m. N. of Budapest by rail. Pop. (1900) 16,563. It is situated on the left bank of the Danube, at the point where this river takes its southern course, and at the foot of the Nagyszál (Ger. *Waitzenberg*), on the outskirts of the Carpathians. It is the seat of a Roman Catholic bishopric, founded in the 11th century, and contains a beautiful cathedral, built in 1761–1777, after the model of St Peter's at Rome. Amongst other buildings are the episcopal palace, with a museum of Roman and medieval antiquities, several convents, and the principal deaf and dumb institute in the country. There are large vineyards in the neighbouring hilly district, and the exportation of grapes is extensively carried on. Vácz was the scene of two victories gained by the Austrians against the Turks, one in 1597 and the other in 1684.

VADE-MECUM, a Latin phrase meaning literally "come with me" (*vade*, imperative of *vadere*, to go or come; *cum*, with; *me*, abl. of *ego*, I), and used in French, Spanish and English for something that a person is in the habit of constantly taking about with him, especially a book of the nature of a handy guide or work of reference.

VAGRANCY (formed from "vagrant," wandering, unsettled; this word appears in Anglo-Fr. as *wakerant* and O.Fr. as *wancrant*, and is probably of Teut. origin, cf. M.L.G. *welkern*, to walk about; it is allied to Eng. "walk," and is not to be directly referred to Lat. *vagari*), the state of wandering without any settled home; in a wider sense the term is applied in England and the United States to a great number of offences against the good order of society. An English statute of 1547 contains the first mention of the word "vagrant," using it synonymously with "vagabond" or "loiterer." Ancient statutes quoted by Blackstone define vagrants to be "such as wake on the night and sleep on the day and haunt customable taverns and alehouses and routs about; and no man wot from whence they come ne whither they go." The word vagrant now usually includes idle and disorderly persons, rogues, vagabonds, tramps, unlicensed pedlars, beggars, &c.

The social problem of vagrancy is one that in 1910 had not yet been satisfactorily dealt with, so far as the United Kingdom is concerned. Indeed, the legislation of the early 19th century remained still in force in England and Wales. In early times, legislation affecting the deserving poor and vagrants was blended. It was only very gradually that the former were allowed to run a freer course, but provisions as to vagrancy and mendicity, including stringent laws in relation to constructive "sturdy beggars," "rogues" and "vagabonds," formed, until well on in the 19th century, a prominent feature of Poor Law legislation. In 1713 an act was passed for reducing the laws relating to rogues, vagabonds, sturdy beggars and vagrants into one act, and for more effectually punishing them and sending them to their homes, the manner of conveying them including whipping in every county through which they passed. This act was in turn repealed in 1740; the substituted consolidation act (13 Geo. II. c. 24), embracing a variety of provisions, made a distinction between idle and disorderly persons, rogues and vagabonds and incorrigible rogues. Four years later was passed another statute which continued the rough classification already mentioned. The laws relating to idle and disorderly persons, rogues and vagabonds, incorrigible rogues and other vagrants in England were again consolidated and amended in 1822, but the act was superseded two years later by the Vagrancy Act (5 Geo. IV. c. 83), which in 1910 was the operative statute.

The offences dealt with under the act of 1824 may be classified as follows: (1) offences committed by persons of a disreputable mode of life, such as begging, trading as a pedlar without a licence, telling fortunes, or sleeping in outhouses, unoccupied buildings, &c., without visible means of subsistence; (2) offences against the poor law, such as leaving a wife and family chargeable to the poor rate, returning to and becoming chargeable to a parish after being removed therefrom by an order of the justices, refusing or neglecting to perform the task of work in a workhouse, or damaging clothes or other property belonging to the guardians; (3) offences committed by professional criminals, such as being found in possession of house-breaking implements or a gun or other offensive weapon with a felonious intent, or being found on any enclosed premises for an unlawful purpose, or frequenting public places for the purpose of felony.

Offences specially characteristic of vagrancy are begging, sleeping out, and certain offences in casual wards, such as refusal to perform a task of work and destroying clothes. Persons committing these last-mentioned offences are classed as "idle and disorderly persons" and are liable on summary conviction to imprisonment with hard labour for fourteen days or on conviction by a petty sessional court to a fine of £5 or a month's imprisonment with or without hard labour. A second conviction makes a person a "rogue and vagabond" liable on summary conviction to imprisonment for fourteen days or on conviction by a petty sessional court to a fine of £25 or imprisonment for three months with or without hard labour. Any person sleeping out without visible means of subsistence is a rogue and vagabond, or on second conviction an incorrigible rogue, while an ordinary beggar is an idle and disorderly person. Under the poor law as reformed in 1834 the primary duty of boards of guardians was to relieve destitute persons within their district, but legislation and administration gradually widened that duty, so that eventually they came to administer relief to vagrants also, or casual paupers, as they are officially termed.

Casual Wards.

Within the limits prescribed by the local government board the treatment in English casual wards varies in a striking degree. Before admission to a casual ward a vagrant requires an order, obtained either from a relieving officer or his assistant. In cases of sudden or urgent necessity, however, the master of the workhouse has power to admit without an order. Generally speaking, vagrants are not admitted to the casual wards before 4 p.m. in winter or 6 p.m. in summer. On admission, they are supposed to be searched, but this is not usually done with much thoroughness; broken food found on them is sometimes allowed to be eaten in the ward; money, pipe, tobacco, &c., are restored to them on discharge. As soon as practicable after admission vagrants are required to be cleansed in a bath with water of suitable temperature. Their clothes are taken away and disinfected and a nightshirt provided. Sleeping accommodation is provided either on the cellular system or in associated wards, the proportion of workhouses providing the former being 2 to 1. Vagrants are, as a general rule, supposed to be detained two nights and are required to perform a task of work. This consists of stone-breaking, wood-sawing, wood-chopping, pumping, digging or oakum picking, and should represent nine hours' work.

The supervising authority has endeavoured, in prescribing the work to which vagrants are put, to make it as deterrent as possible, but in practice the work presents little difficulty to the habitual vagrant, and very few workhouses enforce the two nights' detention rule. The fare provided for vagrants is a welcome relief, too, from their usual scanty fare, and in many of the modern workhouses the wards are almost luxurious in their style and equipment.

The consequence of this generous treatment of those who are "work-shy" is that instead of being repelled or reformed by their treatment, the class is continually on the increase. This increase has received the serious attention of social reformers, and in 1904 the president of the local government board appointed a departmental committee to inquire into the subject of vagrancy. The committee presented its report in 1906, which with the evidence of witnesses is a most valuable exposition of the subject. Among the various recommendations of the committee the most important were the transference of casual wards to the control of police authorities; the issue of way-tickets, as used on the continent of Europe and a very few English counties, by the police to *bona fide* work-seekers, and more especially the detention of habitual vagrants in labour colonies. This last recommendation was also that of the Royal Commission on the Poor Laws which reported in 1909, to which those interested are also referred for valuable information.

Reform movement.

The system of way-tickets has been found useful in Germany and Switzerland in assisting the genuine work-seeker on his way and in discriminating between him and the idle vagrant. In Germany those leaving their districts must carry certain papers of identification in addition to a *Wanderschein* or way-ticket. For the relief of the destitute wayfarer there is the *Herberge* or lodging-house, maintained by a voluntary society, and the *Verpflegungs-station*, or relief station, maintained by the local authorities. In each, those in search of work can obtain lodging and food either for a small payment or by the performance of three hours' work, such as wood-chopping or stone-breaking. In Switzerland way-tickets are issued by a society named the Inter-Cantonal Union to those who can prove that they have worked for an employer within the three preceding months, and that at least five days have elapsed since that employment ceased. The Vagrancy Committee recommended that the English way-ticket in book form should give the man's personal description, his usual trade, his reason for wanting to travel and his proposed destination, and should contain his signature and, possibly, his finger-prints for the purpose of testing identity. The name of each casual ward visited should be stamped on the ticket. The duration of the ticket should be limited to a certain period, possibly a month. With such a ticket, a man should be entitled at the casual ward to a night's lodging, supper and breakfast, and after performing two hours' work to help to pay for his food and lodging he should be free to leave whenever he liked. The name of the next ward on the direct line of his route, which he could reach that night, should be entered on the ticket, and on his arrival at that place he should be treated in the same manner. The ticket would thus form a record of his journey and show whether he was genuinely in search of work.

The remedy which has been considered as most likely to be effective for the cure of habitual vagrancy in England is that of labour colonies, which have been tried on the continent of Europe with a substantial measure of success. These European labour colonies are described in detail in the appendices to the Report and Evidence of the Vagrancy Committee and in the books mentioned at the end of this article, but a *résumé* of the more important colonies may here be given.

Labour colonies.

Holland.—There are two classes of colonies, both originally established by the *Maatschaapij van Weldadigheid* (Society of Beneficence), a society founded by General van den Bosch (1780–1844) in 1818. The *Free Colonies* were designed for the reception of indigent persons, for the purpose of teaching them agriculture, and so enabling them eventually to earn their own living independently. There are three of these free colonies, viz. Frederiksoord, Willemsoord and Wilhelminasoord, forming practically one colony, with a population of about 1500. The expenses of the colonies are met by voluntary subscriptions, but it has been found that the persons who enter the free colonies remain there and few fresh cases are received. The number of inmates has been steadily decreasing. The society also maintained *Beggar Colonies* for the compulsory detention of persons committing the offence of begging. They were more penal than reformatory institutions, and the inmates were taught certain occupations by which they might support themselves on leaving. They did not prove self-supporting and were eventually taken over by the state. The chief institution is that at Veenhuizen, which occupies some 3000 acres of land, and where some 4000 men of the vagrant class are detained for periods varying from not less than six months to not more than three years. There is a similar institution for women at Leiden.

Belgium.—In Belgium the institutions for the repression of vagrancy are maintained by the state under a law of November 27th, 1891. They are of three kinds:—(1) *Dépôts de mendicité* (beggars' depots); (2) *maisons de refuge* (houses of refuge); and (3) *écoles de bienfaisance* (reformatory schools). The beggars' depots are "exclusively devoted to the confinement of persons whom the judicial authority shall place at the disposal of the government" for that purpose, and these are classified as (*a*) able-bodied persons who, instead of working for their living, depend upon charity as professional beggars; (*b*) persons, who, owing to idleness, drunkenness or immorality, live in a state of vagrancy; and (*c*) *souteneurs*. There are two of these depots: one for men at Merxplas, and another for women at Bruges. Persons are committed to the depots on summary conviction for a period of not less than two years or more than seven years. The population of Merxplas is over 5000; the colonists are employed in land reclamation, farming and various industries. Small daily wages, varying from 1d. to 3d., are paid, but these may be withheld for disciplinary purposes. One half of the wages is retained by the management and paid out to the colonist on leaving, the other half being given monthly in the shape of tokens to spend at the canteen in articles of food, tobacco, &c.

The houses of refuge are for men who from age or infirmity are unable to work, or who have been driven to begging or vagrancy by the want of work or misfortune. The chief house of refuge is at Hoogstraeten, where the helpless and sick are received; that at Wortel being reserved for the able-bodied. The colonists earn wages ranging from 1d. to 7d. a day, one-third of this being given to them to spend, and they may take their discharge when they have saved 12s. from their earnings or can show that they have work to go to. The maximum period of detention is one year.

Germany.—In Germany there are between thirty and forty labour colonies, under the management of a charitable association, the Labour Colony Central Board. There is however, no compulsory detention. The institutions which deal with vagrants and persons who neglect to maintain themselves are termed "workhouses" (*Arbeitshäuser*), but they correspond to the compulsory colonies of Belgium and Holland. Under the penal code of 1900, any one (*a*) who wanders about as a vagabond: (*b*) who begs, or causes or allows his children to beg; (*c*) who through gambling, drunkenness or idleness is forced to apply for relief for himself, or those for whose maintenance he is responsible; (*d*) who while in receipt of public relief refuses to do work given him by the authorities; (*e*) who after losing his lodging fails to procure another within a certain time, is liable to detention in a workhouse for a period not exceeding two years. The workhouses are under strict military discipline, the inmates being termed prisoners. They are taught domestic, agricultural and industrial occupations.

Switzerland.—Labour colonies are of two kinds, voluntary and compulsory. The voluntary colonies, of which there are three in Switzerland, are managed by philanthropic societies. Entry and discharge are voluntary, but those seeking admission must agree to stay a stated time, usually one or two months. Compulsory colonies are established in every canton, under the management of the cantonal council. Beggars can be arrested, and, if habitual offenders, can be sent to a labour colony for a period varying from six months to two years. If the man is found to have refused work, he can be sent to a labour colony as a "work-shy" for from three months to two years. Owing in great measure to the success of these labour colonies, vagrancy has considerably diminished in Switzerland, and the colonies everywhere are small; that at Witzwyl, the largest, having less than 200 inmates. Punishment is generally inflicted by reduction of food; the inmates receive no wages, but by industry may earn a remission of their period of detention

Authorities.—For a history of vagrancy see C. J. Ribton-Turner, *History of Vagrants and Vagrancy* (1887); see also *Reports, Evidence and Appendices of Departmental Committee on Vagrancy, 1906*—a most valuable publication—as well as *The Vagrancy Problem* (1910), by W. H. Dawson, who was a witness before the committee, and whose work quoted is full of first-hand information. Two Board of Trade Reports on "Agencies and Methods for dealing with the Unemployed," 1893 and 1904, will be found useful, as also Rev. W. Carlile and V. W. Carlile's *The Continental Outcast* (1906).

(T. A. I.)

VAISON, a town of south-eastern France, in the department of Vaucluse, 26 m. N.N.E. of Avignon by road. Pop. (1906) 2148. The Ouvèze, a tributary of the Rhone, divides Vaison into two quarters—the Roman and early medieval town on the right bank, and the town of the later middle ages on the left bank,—the two communicating by an ancient Roman bridge consisting of a single arch. On the right bank is the church (once the cathedral) of Ste Marie, the choir of which is thought to date in parts from the 9th century, while the nave belongs to the 12th century. A Romanesque cloister containing a collection of old sculpture flanks the church on the north. Remains of a Roman amphitheatre and the chapel of St Quenin (dedicated to a bishop of the 6th century), with a curious apse of the end of the 11th century, are also to be seen in the old town. On the left bank are the parish church (15th and 16th centuries), remains of the medieval fortifications, and the keep of a castle of the counts of Toulouse. The industries of the town include the manufacture of wooden shoes, bellows and agricultural implements. Vaison, under the name of *Vasio*, was one of the principal towns of the *Voconlii*, and was a place of great importance under the Romans, as is shown by an abundance of objects unearthed by excavation, amongst which may be mentioned a fine statue of an athlete (the Diadumenos) in the British Museum. The bishopric established in the 3rd century was suppressed in 1791. Its holders, towards the end of the 12th century, were despoiled of the temporal power in the town by the counts of Toulouse. Subsequently Vaison came, together with the rest of Comtat-Venaissin, under the power of the popes.

VALAIS (Ger. *Wallis*, Ital. *Vallese*), one of the cantons of southern Switzerland. Its name has been explained as meaning the "Wälsch" (*i.e.* non-Teutonic) land. But it is pretty certainly derived from *vallis* or *vallensis pagus*, for the region is simply the old *Vallis Poenina*, or upper valley of the Rhone from its source in the Rhone glacier to the gorge of St Maurice, together with the left bank of the Rhone from that gorge to the Lake of Geneva. The spelling "Vallais" prevailed till the end of the 18th century, and was officially superseded early in the 19th century by "Valais," a form that is very rarely found previously.

The total area of the canton is 2016·6 sq. m. (exceeded only by that of the Grisons and of Bern), of which, however, only 1107 is reckoned as "productive" (forests covering 297·4 sq. m. and vineyards 10·7 sq. m.), while of the rest no fewer than 375 sq. m. (the most considerable stretch in Switzerland) is occupied by glaciers, and 41¾ sq. m. by the cantonal share of the Lake of Geneva. It is therefore naturally one of the poorest cantons in the confederation. It would be still poorer were it not for its excellent wines, and for the fact that in summertime it is visited by many thousands of travellers, for whom inns have been built in nearly every glen and on many high pastures (Zermatt, Saas, Riffel Alp, Evolena, Arolla, Zinal, Champéry, in the Val de Bagnes, in the Lötschen valley, the Bel Alp, the Rieder Alp, the Eggishorn, Binn, and near the Rhone glacier). It consists of a deep and long trench, which becomes a mere gorge between Niederwald and Brieg, the general direction being south-west, till at Martigny the valley makes a sharp bend to the north-west. The loftiest point in the canton is the culminating summit or Dufourspitze (15,217 ft.) of Monte Rosa, which rises on a short spur projecting from the watershed, but the highest mountain which is wholly situated in the canton is the Dom (14,942 ft.), the culminating point of the Mischabel range.

A railway line runs through the canton from Le Bouveret, on the Lake of Geneva, to (73 m.) Brieg, at the N. mouth of the magnificent Simplon tunnel (12¼ m., opened in 1906), the line from St Maurice (about 14 m. from Bouveret) onwards forming the through line from Lausanne towards Milan. There are also mountain railways from Visp up to Zermatt (thence a branch up to the Gornergrat), and from Vernayaz (near Martigny) past Salvan towards Chamonix, while the new tunnel, begun in 1906, beneath the Lötschen Pass or Lötschberg, connects Kandersteg, in the Bernese Oberland, with Brieg, and thus opens up a new direct route from London and Paris to Italy. As the canton is shut in almost throughout its entire length by high mountain ranges it is as a rule only accessible by foot paths or mule paths across this lofty Alpine barrier. But there are excellent carriage roads over the Great St Bernard Pass (8111 ft.), as well as over the Simplon Pass (6592 ft.), both leading to Italy. At the very head of the Rhone valley two other finely engineered carriage roads give access to Uri over the Furka Pass (7992 ft.) and to the canton of Bern over the Grimsel Pass (7100 ft.). Being thus shut in it was almost impossible for the canton to extend its boundaries, save in 1536, when it won the left bank of the Rhone below the gorge of St Maurice. But at early though unknown dates it acquired and still holds the upper bit of the southern slope of the Simplon Pass, as well as the Alpine pastures on the northern slope of the Gemmi. The mineral waters of Leukerbad, and, to a lesser degree, those of Saxon, attract some summer visitors, the vast majority of whom, however, prefer the glorious scenery of the various high Alpine glens.

The canton forms the diocese of Sion (founded in the 4th century), and has St Théodule (or Theodore) as its patron saint. Till 1513 the diocese was in the ecclesiastical province of Moûtiers in the Tarentaise (Savoy), but since then has been immediately dependent on the pope. Within its limits are the three famous religious houses (all now held by Austin Canons) of St Maurice (6th century), of the Great St Bernard, and of the Simplon. Since 1840 the abbot of St Maurice has borne the title of bishop of Bethlehem "in partibus infidelium." Ecclesiastical affairs are managed without any control or interference on the part of the state, though the cantonal legislature presents to the pope as bishop one of four candidates presented by the chapter of Sion.

In 1900 the population was 114,438, of whom 74,562 were French-speaking, 34,339 German-speaking, and 5469 Italian-speaking, while 112,584 were Romanists, 1610 Protestants, and 25 Jews. The linguistic frontier has varied in the course of ages. Nowadays from Sierre (10 m. above Sion) upwards a dialect of German is generally spoken (though it is said that the opening of the Simplon through route has given a considerable impetus to the extension of French among the railway officials), while below Sierre a French dialect (really a Savoyard patois) is the prevailing tongue. To a considerable degree the history of the Valais is a struggle between the German element (predominant politically till 1798) and the French element. Good wines are produced in the district, especially Muscat and Vin du Glacier. Otherwise the inhabitants of the main valley (at least from Brieg onwards) are engaged in agriculture, though suffering much from the inundations of the Rhone, against which great embankments have been constructed, while many swampy tracts have been drained, and so the plague of malarial fever abated to a certain extent.

In the higher valleys the inhabitants are employed in pastoral occupations. The number of "alps" or mountain pastures is 547 (319 in the Lower Valais and 228 in the Upper Valais, the line of division being drawn a little above Sierre), capable of supporting 50,735 cows (33,192 and 17,543 respectively) and of an estimated capital value of 10,873,900 fr. (7,969,500 and 2,904,400 respectively), so that, as might be expected for other reasons, the lower portion of the valley where the climate is less rigorous is richer and more prosperous than the upper portion where other conditions prevail. The capital is Sion (*q.v.*). Next in point of population came (in 1900) Naters (3953), on account of the numbers of Italian workmen engaged in piercing the Simplon tunnel. The neighbouring town of Brieg had then 2182 inhabitants, and the wide commune of Monthey 3392.

The canton is divided into 13 administrative districts, which comprise 166 communes. The cantonal constitution was little advanced till 1907 when it was entirely remodelled. The legislature (*Grand Conseil* or *Gross Rath*) is composed of members elected in the proportion of one for every 1000 (or fraction over 500) citizens, and holds office for four years. The executive (*Conseil d'État* or *Staatsrath*) is composed of five members, named by the Grand Conseil, and holds office for four years. The "obligatory referendum" prevails, while 4000 citizens (6000 in the case of a revision of the cantonal constitution) have the right of "initiative" as to legislative projects. The two members of the Federal *Ständerath* are named by the Grand Conseil, but the six members of the Federal *Nationalrath* are elected by a popular vote. The 1907 cantonal constitution has a curious provision (art. 84) that while members of the cantonal legislature are ordinarily elected by all the voters of a *Bezirk* or district, yet if one or several communes (numbering over 500 inhabitants) demand it, this commune or these communes form a *kreis* or *cercle* and elect a member or members.

The Vallis Poenina was won by the Romans after a great fight at Octodurus (Martigny) in 57 B.C., and was so thoroughly Romanized that the Celtic aboriginal inhabitants and the Teutonic Burgundian invaders (5th century) became Romance-speaking peoples. According to a tradition which can be traced back to the middle of the 8th century, the "Theban legion" was martyred at St Maurice about 285 or 302. Valais formed part of the kingdom of Transjurane Burgundy (888), which fell to the empire in 1032, and later of the duchy of Burgundia Minor, which was held from the emperors by the house of Zähringen (extinct 1218). In 999 Rudolph III. of Burgundy gave all temporal rights and privileges to the bishop of Sion, who was later styled "praefect and count of the Valais," and is still a prince of the Holy Roman Empire; the pretended donation of Charlemagne is not genuine. The bishops had much to do in keeping back the Zähringen, and later the counts of Savoy. The latter, however, succeeded in winning most of the land west of Sion, while in the upper part of the valley there were many feudal lords (such as the lords of Raron, those of La Tour-Châtillon, and the counts of Visp). About the middle of the 13th century we find independent communities or "tithings" (*dizains* or *Zehnten*) growing up, these, though seven in number, taking their name most probably from a very ancient division of the bishop's manors for administrative and judicial purposes. In the same century the upper part of the valley was colonized by Germans from Hasli (Bern), who thoroughly Teutonized it, though many Romance local names still remain. In 1354 the liberties of several of the seven "tithings" (Sion, Sierre, Leuk, Raron, Visp, Brieg and Conches) were confirmed by the Emperor Charles IV. A little later the influence of Savoy became predominant, and the count secured to his family the bishopric of Sion, of which he was already the suzerain. His progress was resisted by the tithings, which in 1375–76 crushed the power of the house of La Tour-Châtillon, and in 1388 utterly defeated the forces of the bishop, the count and the nobles at Visp, this being a victory of the Teutonic over the Romance element in the land. From 1384 the Morge stream (a little below Sion) was recognized as the boundary between Savoyard or Lower Valais and episcopal or Upper Valais. In 1416–17 the *Zehnlen* of the upper bit of the valley made an alliance with Lucerne, Uri and Unterwalden, with a view partly to the conquest of the Val d'Ossola, which was finally lost in 1422, and partly to the successful crushing of the power of the lords of Raron (1420). By the election of Walther von Supersax of Conches as bishop in 1457 the Teutonic element finally won the supremacy. On the outbreak of the Burgundian War the bishop of Sion and the tithings made a treaty with Bern. In November of the same year (1475) they seized all Lower or Savoyard Valais up to Martigny, and in 1476 (March), after the victory of Grandson, won St Maurice, Evian, Thonon and Monthey. The last three districts were given up in 1477, but won again in 1536, though finally by the treaty of Thonon in 1569 Monthey, Val d'Illiez and Bouveret alone were permanently annexed to the Valais, these conquests being maintained with the help of their old allies, Uri, Schwyz and Unterwalden. These conquered districts (or Lower Valais) were always ruled as subject lands by the bishop and tithings of Upper Valais. The Valais took part in the Milanese war of 1512–16, and henceforth was reckoned as an "ally" of the Swiss Confederation. In 1533 a close alliance was made with the Romanist cantons; but by 1551 the Protestants had won so much ground that toleration was proclaimed by the local assembly. In 1586 Upper Valais became a member of the Golden League, and finally in 1603–04 the four tithings of Conches, Brieg, Visp and Raron carried the day in favour of the old faith against those of Leuk, Sierre and Sion. In 1790–91 Lower Valais rose in revolt; but it was not finally freed till 1798, when the whole of Valais became one of the cantons of the Helvetic Republic. Such prolonged and fierce resistance was, however, offered to French rule by the inhabitants that in 1802 Bonaparte declared Valais an independent state under the name of the "Rhodanic Republic," yet in 1810, for strategic reasons, he incorporated it with France as the "department of the Simplon," and it was not freed till the Austrians came in 1813. In 1815 a local assembly was created, in which each of the seven tithings of Upper and each of the six of Lower Valais (though the latter had nearly double the population of the former) elected four members, the bishop being given four votes. This constitution was approved by the Federal Swiss Diet, which thereupon (1815) received the Valais as a full member of the Swiss Confederation. In 1832 the Valais joined the League of Sarnen to maintain the Federal Pact of 1815. In 1839–40 it was convulsed by a struggle between the Conservative and Radical parties, the split into two half cantons being only prevented by the arrival of Federal troops. The constitution was revised in 1839, the local assembly was to be elected according to population (1 member for every 1000 inhabitants), and the bishop was given a seat instead of his four votes, while the clergy elected one deputy. In 1844 civil war raged, many Liberals being slain at the bridge of Trient (May 1844), and the Valais becoming a member of the Sonderbund. By the 1844 constitution the clergy elected a second deputy. The introduction of the Jesuits embittered matters, and the Valais was the last canton to submit in the Sonderbund War (1847); it contented itself, however, with voting steadily against the acceptance of the Federal constitutions of 1848 and 1874. By the constitution of 1848 all ecclesiastical exemptions from taxation were swept away, and the bishop lost his seat in the assembly. New constitutions were framed in 1852, in 1875 and in 1907.

VALDEMAR I., king of Denmark (1131–1182), the son of the chivalrous and popular Canute Lavard and the Russian princess Ingeborg, was born a week after his father's murder, and was carefully brought up in the religious and relatively enlightened household of Asser Rig, whose sons Absalon and Esbjörn Snare, or "the Swift," were his playmates. On the death of King Eric Lam in 1147 Valdemar came forward as one of the three pretenders to the Danish crown, Jutland falling to his portion (compact of Roskilde, 9th of August 1157). Narrowly escaping assassination, at a banquet a few days later, at the hands of his rival, King Sweyn III., he succeeded only with the utmost difficulty in escaping to Jutland, but on the 23rd of October utterly routed Sweyn at the great battle of Grathe Heath, near Viborg, Sweyn perishing in his flight from the field. Valdemar had no longer a competitor. He was the sole male survivor of the ancient royal line; his valour and ability were universally recognized, and in Absalon, elected bishop of Roskilde in 1158, he possessed a minister of equal genius and patriotism. The first efforts of the new monarch were directed against the Wendish pirates who infested the Baltic and made not merely the political but even the commercial development of the Danish state impossible. What the Northmen were to the Western powers in the 8th and 9th the Wends were to the Scandinavian lands in the 11th and 12th centuries. But the Wendish pirates were more mischievous because less amenable to civilization than the Vikings. They lived simply for plunder, and had neither the ambition nor the ability to found colonies like Normandy or Northumbria. We may form some idea of the extent and the severity of their incursions from the fact that at the beginning of the reign of Valdemar the whole of the Danish eastern coast lay wasted and depopulated. Indeed, according to Saxo, one-third of the realm was a wilderness. The stronghold of the Wends was the isle of Rügen. Here lay Arkona their chief sanctuary and Garz their political capital. Both places were captured in 1169 by a great expedition under the command of Valdemar and Absalon; the hideous colossal idol of Rügievit was chopped into firewood for the Danish caldrons, and the Wends were christened at the point of the sword and placed beneath the jurisdiction of the see of Roskilde. This triumph was only obtained, however, after a fierce struggle of ten years, in which the Danes were much hampered by the uncertain and selfish co-operation of their German allies, chief among whom was Henry the Lion, duke of Saxony and Bavaria, who appropriated the lion's share of the spoil. For at the beginning of his reign Valdemar leaned largely upon the Germans and even went the length, against the advice of Absalon, of acknowledging the over-lordship of the Emperor Frederick Barbarossa at the reichstag of Dôle, 1162. Very different was Valdemar's second conference with Barbarossa, on the banks of the Eider, in 1182, when the two monarchs met as equals in the presence of their respective armies, and a double marriage was arranged between two of Valdemar's daughters and two of the emperor's sons. The only serious domestic trouble during Valdemar's reign was the rebellion of the Scanian provinces, which objected to the establishment of a strong monarchy inimical to local pretensions and disturbances, and especially to the heavy taxes and tithes necessary to support the new reign of law and order. The rising was ultimately suppressed by Absalon at the battle of Dysiaa, 1181. In the following year died King Valdemar. His services to his country are aptly epitomized in the epitaph on his ancient monument at Ringsted church which describes him as "Sclavorum dominator, patriae liberator et pacis conservator." His fame has been somewhat obscured by that of his great minister Absalon, whom their common chronicler Saxo constantly magnifies at the expense of his master. Valdemar's worst faults were a certain aloofness and taciturnity. He is the only one of Saxo's heroes in whose mouth the chronicler never puts a speech. But his long reign is unstained by a single ignoble deed, and he devoted himself heart and soul to the promotion of the material and spiritual welfare of Denmark.

See *Danmarks Riges Historie*, vol. i. pp. 570–670 (Copenhagen, 1897–1905); Saxo, *Gesta Danorum*, books 10–16 (Strassburg, 1886). (R. N. B.)

VALDEMAR II., king of Denmark (1170–1241), was the second son of Valdemar I. and brother of Canute VI., whom he succeeded on the 12th of November 1202. Already during his brother's lifetime, as duke of Schleswig, Valdemar had successfully defended Denmark against German aggression. In 1201 he assumed the offensive, conquered Holstein, together with Hamburg, and compelled Count Henry of Schwerin to acknowledge the over-lordship of the Danish crown. Immediately after his coronation, he hastened to his newly won territories, accompanied by the principal civil and ecclesiastical dignitaries of Denmark, and was solemnly acknowledged lord of Northalbingia (the district lying between the Eider and the Elbe) at Lübeck, Otto IV., then in difficulties, voluntarily relinquishing all German territory north of the Elbe to Valdemar, who in return recognized Otto as German emperor. Thus the three bishoprics of Lübeck, Ratzeburg and Schwerin, which hitherto had been fief of the *Reich*, now passed under Danish suzerainty. Lübeck was a peculiarly valuable possession. The city had been founded in 1158 with the express object of controlling the Baltic trade. Only through Lübeck, moreover, could supplies and reinforcements be poured into the German military colonies in Livonia. By closing Lübeck Valdemar had German trade and the German over-seas settlements entirely at his mercy. This state of things was clearly recognized by German statesmen, and in 1208, when the Emperor Otto felt more secure upon his unstable throne, he became overtly hostile to Denmark and would have attempted the recovery of the lost German territory but for the interposition of Pope Innocent III., who threatened to excommunicate any German prince who should attack Valdemar, the equally pious and astute Danish king having undertaken, at the bidding of the holy see, to lead a crusade against the heathen Esthonians. Valdemar's position was still further strengthened when Frederick II., the successful rival of Otto IV., was, in 1215, crowned at Aix-la-Chapelle. Valdemar at once cultivated the friendship of the new emperor; and Frederick, by an imperial brief, issued in December 1214 and subsequently confirmed by Innocent III. and Honorius III., formally renounced all the German lands north of the Elbe and Elde, as well as the Wendish lands on the Baltic, in favour of Valdemar.

An attempt by Otto in 1215 to recover Northalbingia was easily frustrated by Valdemar, who henceforth devoted himself to the extension of the Danish empire over the eastern Baltic shores. Here, however, he had already been forestalled. At the end of the 12th century the whole of the Baltic littoral from semi-Christian Pomerania to orthodox Pleskow was fiercely and obstinately pagan. The connecting link between the western and the eastern Baltic was the isle of Gotland, where German merchants from Lübeck had established a depot (the later Visby). The fur-trade with the Esthonians and Livonians proved so lucrative that a German colony was planted in Livonia itself at what was afterwards Riga, and in 1201 for its better security the colony was converted into a bishopric. A still firmer footing was gained by the Germans on Livonian soil when Abbot Theoderick of Riga founded the order of the Sword (a foundation confirmed by the pope in 1204), whose duty it was to convert the heathen Esths and Livs and appropriate as much of their land in the process as possible. Two years later Valdemar, urged by Archbishop Anders Sunesön, also appeared off the Esthonian coast and occupied the isle of Oesel. In 1210 Valdemar led a second expedition eastwards, this time directed against heathen Prussia and Samland, the chief result of which was the subjection of Mestwin, duke of Pomerania, the leading chieftain in those parts.

Now was to be seen the determining influence of sea-power even in those days. Despite its superior weapons and mode of warfare, the German east Baltic colony was constantly in danger of being overborne by the endless assaults of the dogged aborigines, whose hatred of the religion of the Cross as preached by the knights is very intelligible; and in 1218 Bishop Albert of Riga was driven to appeal for assistance to King Valdemar. Valdemar cheerfully undertook a new crusade "for the honour of the Blessed Virgin and the remission of my own sins." In 1218 he set sail for Esthonia with one of the largest fleets ever seen in northern waters, including a Wendish contingent led by Prince Vitslav. Landing at Lyndantse (the modern Reval) in north Esthonia, Valdemar at once received the submission of the inhabitants, but three days later was treacherously attacked in his camp and only saved from utter destruction by his own personal valour and the descent from heaven, at the critical moment, of a red banner with a white cross on it, the Dannebrog (Danes' Cloth), of which we now hear for the first time, and which henceforth was to precede the Danish armies to victory till its capture by the Ditmarshers, three hundred years later. This victory was followed by the foundation of Reval and the occupation of Harrien and Wirland, the northern districts of Esthonia, by the Danes.

Valdemar was now, after the king of England, the most powerful potentate in the north of Europe. The south-western Baltic was a Danish Mediterranean, and Danish territory extended from the Elbe to lake Peipus. But this scattered and heterogeneous empire required a large standing army and a strong central government to hold it together. It is doubtful whether even the genius of Valdemar would have proved equal to such a stupendous task. He never had the opportunity of attempting it. In May 1223 he was seized at midnight in his tent on the isle of Lyö, whither he had come to hunt, by his vassal and guest Count Henry of Schwerin, and conveyed with his son and many other valuable hostages to the inaccessible castle of Dannenberg-on-Elbe. In this dungeon he languished for two and a half years, and, despite all the efforts of Pope Honorius III. on his behalf, was ultimately forced to pay a heavy ransom, and surrender Northalbingia and all his Wendish conquests except Rügen. On his release Valdemar attempted to retrieve his position by force of arms, but was utterly defeated at the battle of Bornhöved (22nd of July 1227), which deserves a place among the decisive battles of history, for it destroyed at once and for ever the Danish dominion of the Baltic and established the independence of Lübeck, to the immense detriment in the future of all the Scandinavian states. On the other hand Valdemar, by prudent diplomacy, contrived to retain the greater portion of Danish Esthonia (compact of Stensby, 1238). With rare resignation Valdemar devoted the remainder of his life to the great work of domestic reform. His noblest achievement in this respect is the codification of the Danish laws known as the *Jydske Lov* (Jutland Code), which he lived to see completed a few days before his death at Vordingborg on the 28th of March 1241. Valdemar was twice married, his first consort being Dragomir (Dagmar) of Bohemia, his second Berengaria of Portugal. All his four sons, Valdemar, Eric, Abel and Christopher became kings of Denmark.

See *Danmarks Riges Historie*, vol. i. pp. 736–849 (Copenhagen, 1897–1905). (R. N. B.)

VALDEMAR IV., king of Denmark (*c.* 1320–1375), was the youngest son of Christopher II. of Denmark. Valdemar was brought up at the court of the German emperor, Louis of Bavaria, during those miserable years when the realm of Denmark was partitioned among Holstein counts and German *Ritter*, while Scania, "the bread-basket" of the monarchy, sought deliverance from anarchy under the protection of Magnus of Sweden. Even the Hanse Towns, the hereditary enemies of Denmark, regarded the situation with disquietude. "One would gladly have seen a single king in Denmark if only for peace sake," says the contemporary Lübeck chronicle, "for peace was not to be had either at sea or on land." The assassination at Randers of the detested Holstein tyrant Count Gerhard III. (1340), who for nine years had held Jutland and Funen and dominated the rest of Denmark, first opened Valdemar's way to the throne, and on midsummer day 1340 he was elected king at a *Landsting* held at Viborg, after consenting to espouse Helveg, the sister of his most important confederate, Valdemar, duke of Schleswig.

Neither the time nor the place of Valdemar's birth is known, but he could not have been more than twenty when he became the nominal king of Denmark, though, as a matter of fact, his territory was limited to the northernmost county of Jutland. His precocious maturity is strikingly evident from the first. An energy which never slackened, a doggedness which no adversity could crush, a fiery ambition coupled with the coolest calculation, and a diplomatic unscrupulousness which looked always to the end and never to the means, these were the salient qualities of the reconstructor of the dismembered Danish state. First Valdemar aimed at the recovery of Zealand, which was actually partitioned among a score of Holstein mortgagees who ruled their portions despotically from their strong castles, and sucked the people dry. The oppressed clergy and peasantry regarded Valdemar as their natural deliverer; but so poor and friendless was he that the work of redemption proved painfully slow. In November 1343 he obtained the town and castle of Copenhagen from King Magnus Smek of Sweden, by reconfirming in still more stringent terms the previous surrender of the rich Scanian provinces, and by the end of the following year he had recovered the whole of North Zealand. In 1347 the remainder of Zealand was redeemed, and the southern isles, Laaland, Falster and Mön, also fell into the king's strenuous hands. By this time, too, the whole of Jutland (except the province of Ribe) had fallen to him, county by county, as their respective holders were paid off. In 1349, at the *Landsting* of Ringsted, Valdemar proudly rendered an account of his stewardship to the Estates of Zealand, and the bishop of Roskilde congratulated him on having so miraculously delivered his people from foreign thraldom. In August 1346, he prudently rid himself of the distant and useless province of Esthonia by selling it very advantageously to the Livonian Order.

Valdemar now gave full play to his endless energy. In north German politics he interfered vigorously to protect his brother-in-law the Margrave Louis of Brandenburg against the lords of Mecklenburg and the dukes of Pomerania, with such success that the emperor, Charles IV., at the conference of Bautzen, was reconciled to the Brandenburger and allowed Valdemar an annual charge of 16,000 silver marks on the city of Lübeck (1349). Some years later Valdemar seriously thought of reviving the ancient claims of Denmark upon England, and entered into negotiations with the French king, John, who in his distress looked to this descendant of the ancient Vikings for help. A matrimonial alliance between the two crowns was even discussed, and Valdemar offered, for the huge sum of 600,000 gulden, to transport 12,000 men to England. But the chronic state of rebellion in western Denmark, which, fomented by the discontented Jutish magnates, lasted with short intervals from 1350 to 1360, compelled Valdemar to renounce these far-reaching and fantastic designs. On the other hand, he proved more than a match for his domestic rebels, especially after his great victory at Brobjaerg in Funen (1357). Finally, the compact of Kalundborg restored peace to the kingdom.

Valdemar now turned his eyes from the west to the east, where lay the "kingdom of Scania." Valdemar had indeed pledged it solemnly and irrevocably to King Magnus of Sweden, who had held it for twenty years; but profiting by the difficulties of Magnus with his Norwegian subjects, after skilfully securing his own position by negotiations with Albert of Mecklenburg and the Hanseatic League, Valdemar suddenly and irresistibly invaded Scania, and by the end of 1361 all the old Danish lands, except North Holland, were recovered.

By the recovery of Scania Valdemar had become the lord of the great herring-fishery market held every autumn from St Bartholomew's day (24th of August) to St Denis's day (9th of October) on the hammer-shaped peninsula projecting from the S.W. corner of Scania containing the towns of Skanör and Falsterbo. This flourishing industry, which fully occupied 40,000 boats and 300,000 fishers assembled from all parts of Europe to catch and salt the favourite Lenten fare of the whole continent, was the property of the Danish crown, and the innumerable tolls and taxes imposed by the king on the frequenters of the market was one of his most certain and lucrative sources of revenue. Foreign chapmen eagerly competed for special privileges of Skanör and Falsterbo, and the Hanseatic merchants in particular aimed at obtaining a monopoly there. But Valdemar was by no means disposed to submit to their dictation, and political conjunctures now brought about actual hostilities between Valdemar and the Hansa, or at least that portion of it known as the Wendish Towns,[1] whose commercial interests lay principally in the Baltic.

From time immemorial the isle of Gotland had been the staple of the Baltic trade, and its capital, Visby, whose burgesses were more than half German, the commercial intermediary between east and west, was the wealthiest city in northern Europe. In July 1361 Valdemar set sail from Denmark at the head of a great fleet, defeated a peasant army before Visby, and a few days later the burgesses of Visby made a breach in their walls through which the Danish monarch passed in triumph. The conquest of Gotland at once led to a war between Valdemar and Sweden allied with the Hanseatic towns; but in the spring of 1362 Valdemar repulsed from the fortress of Helsingborg a large Hanseatic fleet provided with "shooting engines" (cannon) and commanded by Johan Wittenburg, the burgomaster of Lübeck. In Sweden proper he was equally successful, and the general pacification which ensued in April 1365, very greatly in his favour, was cemented by the marriage of his daughter Margaret with Hakon VI. of Norway, the son of King Magnus.

Valdemar was now at the height of his power. Every political rival had been quelled. With the papal see, since his visit to Avignon in 1364, he had been on the best of terms. His ecclesiastic patronage was immense, and throughout the land he had planted strong castles surely held by the royal bailiffs. But in the winter of 1367–68 a hostile league against him of all his neighbours threatened to destroy the fruits of a long and strenuous lifetime. The impulse came from the Hansa. At a *Hansetag* held at Cologne on the 11th of November 1367, three groups of the towns, seventy in number, concerted to attack Denmark, and in January 1368 Valdemar's numerous domestic enemies, especially the Jutlanders and the Holstein counts, acceded to the league, with the object of partitioning the realm among them. And now an astounding and still inexplicable thing happened. At Easter-tide 1368, on the very eve of this general attack, Valdemar departed for three years to Germany, leaving his realm in the capable hands of the earl-marshal Henning Podbusk. Valdemar's skilful diplomacy, reinforced by golden arguments, did indeed induce the dukes of Brunswick, Brandenburg and Pomerania to attack the confederates in the rear; but fortune was persistently unfriendly to the Danish king,

[1] Rostock, Greifswald, Wismar and Stralsund.

and peace was finally concluded with the towns by Podbusk and the Danish Council of State at the congress of Stralsund, 1370. The conditions of peace were naturally humiliating for Valdemar,[1] though, ultimately, he contrived to render illusory many of the inordinate privileges he was obliged to concede. He was also able, shortly before his death on the 24th of October 1375, to recover the greater part of Holstein from the rebels.

We know astonishingly little of him personally. A few caustically witty sayings of his, and St Bridget's famous comparison of him to a fowler who could entice the shyest birds with his fluting, are almost all his *personalia*. It would be a mistake to regard him as a patriot. He was too unscrupulous and self-centred to play for anything but his own hand. Yet no other Danish king did so much for his country. His statesmanship, as judged from his acts, was all but flawless, and he was certainly one of the greatest of the medieval diplomatists. His character peeps forth most clearly perhaps in the saying which has become his epithet, *Atterdag* (" There will be a to-morrow "), which is an indication of that invincible doggedness to which he owed most of his successes.

See *Danmarks Riges Historie*, vol. ii. pp. 275–356 (Copenhagen, 1897–1905). (R. N. B.)

VALDEPEÑAS, a town of Spain, in the province of Ciudad Real; near the right bank of the river Jabalon, a tributary of the Guadiana, and on the Madrid-Cordova and Valdepeñas-La Calzada railways. Pop. (1900) 21,015. Valdepeñas is the largest town in the Campo de Calatrava, an extensive plain north of the Sierra Morena. Its commerce developed rapidly in the last quarter of the 19th century, largely as a result of improvements in its communications by road and rail; the population in the same period increased by more than one-third. Valdepeñas contains large distilleries, tanneries, flour mills, cooperages, and other factories; but its trade is chiefly in the red wines for which the district is famous throughout Spain. There are hot mineral springs near the town.

VALDES, JUAN DE (*c.* 1500–1541), Spanish religious writer, younger of twin sons of Fernando de Valdes, hereditary regidor of Cuenca in Castile, was born about 1500 at Cuenca. He has been confused with his twin-brother Alphonso (in the suite of Charles V. at his coronation in Aix-la-Chapelle, 1520; Latin secretary of state from 1524, died in 1532 at Vienna). Juan, who probably studied at the university of Alcala, first appears as the anonymous author of a politico-religious *Diálogo de Mercurio y Caron*, written and published about 1528. A passage in this work may have suggested Don Quixote's advice to Sancho Panza on appointment to his governorship. The *Diálogo* attacked the corruptions of the Roman Church; hence Valdes, in fear of the Spanish Inquisition, left Spain for Naples in 1530. In 1531 he removed to Rome, where his criticisms of papal policy were condoned, since in his *Diálogo* he had upheld the validity of Henry VIII.'s marriage with Catherine of Aragon. On the 12th of January 1533 he writes from Bologna, in attendance upon Pope Clement VII. From the autumn of 1533 he made Naples his permanent residence, his name being Italianized as Valdesso and Val d'Esso. Confusion with his brother may account for the statement (without evidence) of his appointment by Charles V. as secretary to the viceroy at Naples, Don Pedro de Toledo; there is no proof of his holding any official position, though Curione (in 1544) writes of him as " cavalliere di Cesare." His house on the Chiaja was the centre of a literary and religious circle; his conversations and writings (circulated in manuscript) stimulated the desire for a spiritual reformation of the church. His first production at Naples was a philological treatise, *Diálogo de la Lengua* (1533). His works entitle him to a foremost place among Spanish prose writers. His friends urged him to seek distinction as a humanist, but his bent was towards problems of Biblical interpretation in their bearing on the devout life. Vermigli (Peter Martyr) and Marcantonio Flaminio were leading spirits in his coterie, which included Vittoria Colonna and her sister-in-law, Giulia Gonzaga. On Ochino, for whose sermons he furnished themes, his influence was great. Carnesecchi, who had known Valdes at Rome as " a modest and well-bred courtier," found him at Naples (1540) " wholly intent upon the study of Holy Scripture," translating portions into Spanish from Hebrew and Greek, with comments and introductions. To him Carnesecchi ascribes his own adoption of the Evangelical doctrine of justification by faith, and at the same time his rejection of the policy of the Lutheran schism. Valdes died at Naples in May 1541.

[1] They even gave the Hansa a vote in the future election of the Danish kings.

His death scattered his band of associates. Abandoning the hope of a regenerated Catholicism, Ochino and Vermigli left Italy. Some of Valdes's writings were by degrees published, in Italian translations. Showing much originality and penetration, they combine a delicate vein of semi-mystical spirituality with the personal charm attributed to their author in all contemporary notices. Llorente traces in Valdes the influence of Tauler; any such influence must have been at second hand. The *Aviso* on the interpretation of Scripture, based on Tauler, was probably the work of Alphonso. Valdes was in relations with Fra Benedetto of Mantua, the anonymous author of *Del Benefizio di Gesù Cristo Crocefisso*, revised by Flaminio (reprinted by Dr Babington, Cambridge, 1855). The suggestion that Valdes was unsound on the Trinity was first made in 1567 by the Transylvanian bishop, Francis Dávid (see article SOCINUS); it has been adopted by Sand (1684), Wallace (1850) and other anti-Trinitarian writers, and is countenanced by Bayle. To this view some colour is given by isolated expressions in his writings, and by the subsequent course of Ochino (whose heterodox repute rests, however, on the insight with which he presented objections). Valdes never treats of the Trinity (even when commenting on Matt. xxviii. 19), reserving it (in his *Latte Spirituale*) as a topic for advanced Christians; yet he explicitly affirms the consubstantiality of the Son, whom he unites in doxologies with the Father and the Holy Spirit (*Opusc.* p. 145). Practical theology interested him more than speculative; his aim being the promotion of a healthy and personal piety.

The following is a list of his writings:—

(1) *Diálogo de Mercurio y Caron* (no date or place; 1528?). An Italian translation by Nicolo Franco, Venice (no date); reprinted, Venice, 1545. Bound with the original (and with the translation) will usually be found a *Diálogo* by Alphonso de Valdes on the sack of Rome in 1527; this is also ascribed to Juan in the reprint, *Dos Diálogos* (1850).

(2) *Diálogo de la Lengua* (written, 1533; first printed, Madrid, 1737; reprinted, 1860, 1873).

(3) *Qual Maniera si devrebbe tenere a informare . . . gli figliuoli de Christiani delle Cose della Religione* (no date or place; before 1545, as it was used by the Italian translator of Calvin's catechism, 1545). No Spanish original is known. Reproduced as *Latte Spirituale*, Basel, 1549; Paris, 1550; in Latin, by Pierpaolo Vergerio, 1554; 1557; in Spanish, by Ed. Boehmer, 1882; in English, by J. T. Betts, 1882; also in German (twice) and in Polish.

(4) *Trataditos*, Bonn, 1881, from a manuscript in the Palatine Library, Vienna; in Italian, *I Cinque Tratatelli Evangelici*, Rome, 1545; reprinted, 1869; in English, by J. T. Betts, in *XVII Opuscules*, 1882.

(5) *Alfabeto Christiano* (written about 1537), in Italian, Venice, 1545; in English, by B. B. Wiffen, 1861; no Spanish original is known.

(6) *Ciento i Diez Conçideraçiones*; all copies of the original edition suppressed by the Spanish Inquisition; thirty-nine of the *Conçideraçiones*, published with the *Trataditos*, from a Vienna manuscript; in Italian, by Celio Secondo Curione, *Le Cento et Dieci Divine Consideratione*, Basel, 1550; in French, by Claude de Kerquifinen, Lyons, 1563; Paris, 1565; in English, by Nicholas Ferrar (at the instance of George Herbert), Oxford, 1638; Cambridge, 1646; another version by J. T. Betts, 1865; in Spanish, by Luis Usóz i Rio, 1855.

(7) *Seven Doctrinal Letters* (original published with the *Trataditos* from Vienna manuscript), in English, by J. T. Betts, with the *Opuscules*.

(8) *Comentario Breve . . . sobre la Epistola de San Pablo a los Romanos*, Venice, 1556 (with text; edited by Juan Perez de Pineda); reprinted, 1856; in English, by J. T. Betts, 1883.

(9) *Comentario Breve . . . sobre la Primera Epistola de san Pablo a los Corintios*, Venice, 1557 (edited, reprinted and translated as No. 8).

(10) *El Evangelio de San Mateo* (text and commentary), 1881, from Vienna manuscript; in English, by J. T. Betts, 1883.

(11) *El Salterio* (the Psalms from Hebrew into Spanish), published with the *Trataditos* from Vienna manuscript.

(12) At Vienna is an unpublished commentary in Spanish on Psalms i.-xli.

(13) Sand mentions a commentary on St John's Gospel, not known to exist.

Notices of Valdes in Sand (*Biblioth. Antitrinitar*, 1684), Bayle and Wallace (*Antitrin. Biog.*, 1850) are inadequate. Revival of interest in him is due to McCrie (*Hist. Ref. in Italy*, 1827; *Hist. Ref. in Spain*, 1829). Fuller knowledge of his career was opened up by Benjamin B. Wiffen, whose *Life* of Valdes is prefixed to Betts's translation of the *Considerations*, 1865. Discoveries have since been made in the Aulic Library, Vienna, by Dr Edward Boehmer; cf. his *Span. Reformers of Two Centuries* (1874), his *Lives of J. and A. de Valdes* (1882), and his article in *Realencyklopädie für prot. Theol. und Kirche* (1885). See also M. Young, *Aonio Paleario* (1860); K. Benrath, *Bernardino Ochino* (1875;) Menendez Pelayo, *Los Heterodoxos Españoles* (1880); G. Bonet-Maury, *Early Sources of Eng. Unit. Christ.* (trans. E. P. Hall, 1884). (A. Go.*)

VALDIVIA, a southern province of Chile, bounded N. by Cautin, E. by Argentina, S. by Llanquihue and W. by the Pacific. Area, 8649 sq. m. Pop. (1895) 60,687; (1902, estimated) 76,000. The province is roughly mountainous in the E., is heavily forested and is traversed by numerous rivers. There is a chain of lakes across its eastern side near the Andes, the largest of which are Villarica, Rinihue and Ranco. The rivers are the Tolten on the northern boundary, the Valdivia, or Calle-Calle, with its large tributaries in the central part of the province, and the Bueno on the southern frontier. The Valdivia (about 100 m. long) has its sources in the Andes and flows W. to the Pacific. Its largest tributary on the N. is the Rio Cruces. The Valdivia is the outlet for Lake Rinihue and is navigable for a long distance. Valdivia is one of the most recently settled provinces and has a large immigrant element, chiefly German. Its most important industry is that of clearing away the heavy forests and marketing the timber. Stock-raising is an important industry, and wheat is grown on the cleared lands. Lumber, cattle, leather, flour and beer are exported. The capital is Valdivia, a flourishing city on the Valdivia river, 12 m. above its port, Corral, near the mouth of the river. Pop. (1895) 8062; (1902, estimated) 9704. It is a roughly built pioneer town, in which wood is the principal building material. The mean annual temperature is 59·9° and its annual rainfall is 115 in. A government railway runs to Osorno on the S., and in 1909 was being connected with the central line running S. through Bio-Bio and Cautin. The port of Corral, at the mouth of the Valdivia river, in lat. 39° 49′ S., long. 73° 19′ W., is situated on the S. side of a broad, lagoon-like sheet of water, forming one of the best natural harbours on the coast. It is a port of call for several lines of steamers, including those of the Pacific Mail running between Liverpool and Valparaiso.

VALDOSTA, a city and the county-seat of Lowndes county, Georgia, U.S.A., about 155 m. S.W. of Savannah. Pop. (1890) 2845; (1900) 5613 (2958 negroes); (1910) 7656. Valdosta is served by the Atlantic Coast Line, the Georgia Southern & Florida, and the Georgia & Florida railways. The city has a public library; the principal public buildings are the County Court House and the Federal building. Valdosta is in a rich farming and forest country; among its manufactures are cotton products, lumber, &c. The city owns and operates the water works. Valdosta was first settled in 1859, was incorporated as a town in 1860, and was chartered as a city in 1901.

VALENCE, a town of south-eastern France, capital of the department of Drôme, situated on the left bank of the Rhone, 65 m. S. of Lyons on the railway to Marseilles. Pop. (1906), town, 22,950; commune, 28,112. The river is here crossed by a fine suspension bridge. The cathedral of St Apollinaris, which has an interesting apse, was rebuilt in the 11th century in the Romanesque style of Auvergne and consecrated in 1095 by Urban II. It was greatly injured in the wars of religion, but restored in the first decade of the 17th century. The porch and the stone tower above it were rebuilt in 1861. The church contains the monument of Pius VI., who died at Valence in 1799. A curious house (Maison des Têtes) of the 16th century has a sculptured front with heads of Homer, Hippocrates, Aristotle, Pythagoras, &c. The Maison Dupré-Latour with a beautifully carved doorway and the sepulchral monument known as the Pendentif date from the same century. The library and the museum containing Roman antiquities, sculptures and a picture gallery, are housed in the old ecclesiastical seminary. The most notable of the monuments erected by Valence to its natives are those to Emile Augier the dramatist by the duchess of Uzès (1897) and to General Championnet (1762–1800).

Valence is the seat of a bishop, a prefect and a court of assizes, and has a tribunal of first instance, a board of trade arbitration, a chamber of commerce, a branch of the Bank of France, training colleges for both sexes, and a communal college. Among the industries are flour-milling, cooperage and the manufacture of furniture, liquorice, whitewash, and tapioca and similar foods. Trade, in which the port on the Rhone shares, is in fruit, cattle and live-stock, wine, early vegetables and farm produce, &c.

Valentia was the capital of the Segalauni, and the seat of a celebrated school prior to the Roman conquest, a colony under Augustus, and an important town of *Viennensis Prima* under Valentinian. Its bishopric dates probably from the 4th century. It was ravaged by the Alani and other barbarians, and fell successively under the power of the Burgundians, the Franks, the sovereigns of Arles, the emperors of Germany, the dukes of Valentinois, the counts of Toulouse, and its own bishops. The bishops were often in conflict with the citizens and the dukes of Valentinois, and to strengthen their hands against the latter the pope in 1275 united their bishopric with that of Die. The citizens put themselves under the protection of the dauphin, and in 1456 had their rights and privileges confirmed by Louis XI. and put on an equal footing with those of the rest of Dauphiné, the bishops consenting to recognize the suzerainty of the dauphin. In the 16th century Protestantism spread freely under Bishop Jean de Montluc, and Valence became the capital of the Protestants of the province in 1563. The town was fortified by Francis I. It had become the seat of a celebrated university in the middle of the 15th century; but the revocation of the edict of Nantes struck a fatal blow at its industry, commerce and population.

VALENCIA, or Valentia, an island off the south-western coast of Ireland, county Kerry, forming the southern horn of Dingle Bay. It is about 7 m. long and 3 broad at its widest part. The strait between the island and the mainland forms a fine natural harbour, land-locked with narrow entrances, and a depth of about 40 ft. at low tide, and thus capable of accommodating large vessels. At its north end is the Valencia Harbour station on a branch of the Great Southern & Western railway, with a ferry across the strait to Knightstown, the town on the island. The harbour is sometimes visited by warships, and is extensively used by fishing vessels, for which it is the head-quarters of a district. At Knightstown are the buildings of the Anglo-American Telegraph Company, for it was from Valencia, after several unsuccessful attempts from 1857 onward, that the steamer "Great Eastern" first succeeded in laying the cable to Newfoundland in 1866. There are four cables across the Atlantic and one to Emden in Germany. On the island are Protestant and Roman Catholic churches, constabulary barracks and a coastguard station. The meteorological reports received by the central office in London from Valencia are of high importance as giving the first indication from any station in the United Kingdom of weather influences from the Atlantic. Valencia formerly exported slate of fine quality. Its cliff scenery is magnificent, and its luxuriant semi-tropical vegetation remarkable. Its name is of Spanish origin; the Irish originally called it Dairbhre, or Darrery, the oak forest.

VALENCIA, the name of a maritime province of eastern Spain, and of the kingdom in which this province was formerly included. The province is bounded on the N. by Teruel and Castellon de la Plana, E. by the Mediterranean, S. by Alicante and W. by Albacete and Cuença. Pop. (1900) 806,556; area, 4150 sq. m. Along the coast the surface is for the most part low and level, the fertile *vegas*, or cultivated plains, of Valencia, Játiva and Gandia in many places rising very little above sea-level. To the west of these is a series of tablelands with a mean elevation of about 1000 ft., which in turn rise into the mountains that form the eastern boundary of the tableland of New Castile, and attain within the province a maximum elevation of nearly 4000 ft. The coast is skirted by considerable stretches of sand-dune, and by a series of these the lagoon called the Albufera (*q.v.*) de Valencia is separated from the Mediterranean. The principal rivers are the Guadalaviar or Turia and the Jucar (*q.v.*). The Guadalaviar enters the province in the extreme north-west, flows south-east, and falls into the sea below the city of Valencia; it receives numerous tributaries of little importance, and it dispenses fertility by numerous aqueducts, mostly of Moorish origin, throughout the lower part of its course. Both the Jucar and its right-hand tributary the Albaida supply water for an extensive system of irrigation canals.

In the lowlands, especially towards the coast, very little rain falls; but heavy rain and melting snow among the highlands in which the principal rivers rise occasionally cause sudden and disastrous floods. The *vegas* have an exceptionally fine, almost sub-tropical climate. In their low-lying portions rice is the favourite crop; elsewhere wheat, maize and all kinds of fruit are abundantly grown; the mulberry is cultivated for silk; and wine and oil are produced. Esparto grass is grown in the less fertile areas. The tablelands produce, according to their elevation and exposure, figs, almonds, olives or vines. The pastures of the higher grounds sustain numerous sheep and goats; but cattle and horses are relatively few. The hillsides are somewhat bare of timber. The mineral resources of the province are little developed. The fishing industry on the coast is considerable, and there are manufactures of silk, carpets and tapestry, woollen, hemp and linen fabrics, glass, pottery and leather; there are also iron foundries, distilleries, cooperages and oil refineries. These industries are important, although the silk manufactures declined after three decades of prosperity (from 1850 to 1880). The coast railway from Barcelona traverses the province, passing through the city of Valencia on the way south to Alicante and Murcia. From Játiva another important line diverges westward to Albacete, and there are branch lines from Valencia to Liria and to Utiel, from Silla to Cullera, from Carcagénte to Gandía, and thence to Dénia and Alcóy in the province of Alicante. Valencia, the capital and principal seaport, and the towns of Alcira, Requena, Sueca, Játiva, Carcagénte, Cullera, Utiel, Onteniente and Gandía, are described in separate articles. Other towns of more than 7000 inhabitants are Algemesí, Catarroja, Liria, Sagunto, Tabernas de Valldigna and Torrente.

When the ancient kingdom of Valencia was incorporated into Aragon in 1238, it included the provinces of Castellon de la Plana (*q.v.*) and Alicante (*q.v.*). It was bounded inland on the N. by Catalonia, W. by Aragon and New Castile, and S. by Murcia. This region has an area of 8830 sq. m.; its present population is about 1,600,000. For its history see VALENCIA (city). The inhabitants are of very mixed race, owing to the successive occupation of the country by Iberians, Greeks, Carthaginians, Romans, Visigoths and Moors. Their dialect resembles Catalan but is softer, and contains a larger percentage of Arabic words. On the physique of the people, as on their customs and the architecture of their houses, Moorish rule left a durable imprint. The elaborate irrigation-works and the system of intensive agriculture which have rendered the *huertas* or gardens of Valencia celebrated were initiated by the Moors; the fame of the Elche date-groves, the Alicante vineyards and the Valencia orange plantations, was also originally due to them. With the decline of the caliphate of Cordova early in the 11th century, Valencia became an independent kingdom, which passed successively into the power of the Almoravides and Almohades. When James I. of Aragon captured the city of Valencia in 1238, he found so large a number of Mozarabic Christians who had adopted the Arabic language and many of the customs of their rulers, that it was found necessary to translate the Bible into Arabic for their use. In 1609, 200,000 Moriscoes, or Moors who outwardly professed Christianity, were banished from the country. In 1833 Valencia was divided into the three provinces already named.

VALENCIA, the capital of the Spanish province of Valencia, on the right bank of the river Guadalaviar or Turia, 3 m. from the Mediterranean Sea, and 304 m. by rail E.S.E. of Madrid. Pop. (1877) 143,856; (1900) 213,550. Valencia is connected by numerous railways with all parts of Spain, and has one of the most secure and capacious harbours on the east coast. It is the seat of an archbishop, a court of appeal, a university, a captain-general and an army corps. All round it stretches the beautiful and closely cultivated Huerta de Valencia, an alluvial plain planted with groves of oranges, lemons and mulberries. The climate is mild and very dry; rain hardly ever falls except when the east wind blows from the sea. The white houses of the city, often Moorish in many details of their architecture, and the multitude of domes and towers overlaid with blue, white and gold tiles, give to Valencia an oriental appearance which is remarkable even in south-eastern Spain. Until 1871 it was enclosed by a wall founded by the Romans and rebuilt in 1356 by Pedro IV.; two picturesque gateways with machicolated towers still remain, but few other remnants are left of the old fortifications, the site of which is now occupied by fine boulevards. The river, reduced, except in time of flood, to a scanty stream by the demands made upon it for irrigation, is crossed by several bridges, of which the longest has thirteen arches. The streets are for the most part narrow, crooked and somewhat gloomy, but in the more modern quarters there are some broad and handsome thoroughfares. Towards the close of the 19th century Valencia was lighted by gas and electricity; electric tramways were laid down and a good water-supply and drainage system secured.

The cathedral (La Seo), begun in 1262, was in 1459 lengthened in its original Gothic style, but in such a way as to spoil its proportions, and in the 18th century it was further injured by pseudo-Classic additions. It possesses some fine examples of the sculpture and metal-work of the 15th century, as well as of the Valencian school of painting. The campanile (el Miguelete), an isolated octagonal Gothic tower, 152 ft. in height, commands an extensive view of the town and surrounding country. Near the cathedral is the episcopal palace; its large and valuable library, rich in medals and other antiquities, suffered greatly during the French occupation in 1812. Besides the cathedral, Valencia has numerous parish churches and other ecclesiastical buildings, none of them of great architectural beauty or interest; the church of St Nicholas (of Moorish origin) has, however, good specimens of paintings by Vicente Juanes as well as frescoes by Dionis Vidal; and Ribalta can be studied in the chapel of the Colegio de Corpus or del Patriarcha.

Valencia University was formed about 1500 by the fusion of an episcopal school of theology with a municipal school of arts, medicine and law, both dating from the middle of the 14th century. New colleges were soon added, and up to 1600 the university attained much prosperity and a high reputation. It then began to decline, but was reorganized after 1848, and resumed its place as one of the leading universities. The average number of students is 1750; law, philosophy, natural science and medicine are the subjects taught. The large but uninteresting university buildings date from the 16th century. The library, containing about 60,000 volumes, was robbed of its chief treasures by the French in 1812. There is a rich provincial museum, with paintings by Velazquez, Ribera, Dürer, Juanes, Bosco, Goya and many modern artists. Among other public buildings may be mentioned the court-house, a Doric edifice, dating from the time of Ferdinand the Catholic, and having curious frescoes (1592) in its main hall; the custom-house (1758), now a cigar manufactory, employing some 3500 women; and the silk exchange, a large and elegant Gothic hall (1482). The citadel, on the north-east of the town, was built by Charles V. as a protection against Khair-ed-Din Barbarossa, the sea-rover; in the south-west of the town is the former College of Saint Augustine, now used as a model prison, adjoining which is a large hospital. Beyond the old line of the walls there are a botanic garden, a large bull-ring, and various shady promenades, including the beautiful "Glorieta," and, on the north side of the river, the alameda, leading to the port (El Grao). The principal manufacture is silk, and the town is also celebrated for its coloured tiles or "azulejos," and its oranges. Linen, woollen and esparto fabrics, hats, fans, leather, paper, cigars, glass and pottery are also manufactured, and there are foundries and printing-works. Corn, rice, silk, saffron, oranges, raisins, almonds, figs and other fruits are extensively exported, and iron, hardware, timber, manure, grain and colonial produce are imported.

The port and the village of Villanueva del Grao are 3 m. E. by N. of Valencia, and are connected with it by two railways and two tramways. The harbour works, begun in 1792 at local expense, have been steadily improved, and now provide many facilities for loading or discharging on the moles and wharves. During the five years, 1901–5, about 2600 ships of 1,500,000 tons entered at the port every year. About 2000 of these were Spanish, including a large number of small coasters. The majority of the foreign ocean-going ships were British. The fishing fleet of El Grao comprises about 600 boats with 2800 hands. About 1 m. N. is the town of Pueblo Nuevo del Mar or El Cabañal, to which large numbers of the Valencians migrate in summer for sea-bathing.

The earliest historical mention of Valencia (*Valentia*) is by Livy (*Epit.* lv.), according to whom Junius Brutus settled the soldiers of Viriathus here in 138 B.C., and invested the town with the *jus Latinum*. It sided with Sertorius (*c.* 77 B.C.), and was accordingly taken and partially destroyed by Pompey in 75 B.C.; but it must have recovered speedily, as it is mentioned by Pliny (iii. 4) as a colony in the region of the Edetani, and by Mela as an important place. It was taken by the Visigoths in A.D. 413, and by the Moors in 714. After the downfall of the caliphate of Cordova, an independent Moorish kingdom of Valencia was established in 1021, and extended along the coast from Almeria to the Ebro estuary. The Almoravides occupied the city in 1094, but it was retaken within a few months by the Christians under the Cid (*q.v.*), from whom it is sometimes called Valencia del Cid. The Moors recovered possession in 1101 and the kingdom was re-established in 1146. After 1172 it became tributary to Aragon, and in 1238 James I. of Aragon added it to his dominions. The first Spanish printing-press is said to have been set up here in 1474. Towards the close of the 15th century Valencia was annexed to Castile and placed under the rule of a viceroy. In the 16th and 17th centuries it became the seat of a considerable school of painting, of which Vicente Juanes (1523–1579) may be regarded as the founder, and to which belonged also Francisco de Ribalta (1550–1628), Juan de Ribalta (1597–1628), José Ribera (1588–1656), Pedro Orrente (1560–1644) and J. G. Espinosa (1600–1680). In the beginning of the 17th century Valencia and its surrounding district suffered greatly from the expulsion of the Moriscos, its most industrious and enterprising cultivators. In the War of Succession Valencia sided emphatically with the house of Austria, for which it was punished by being deprived of many of its ancient privileges. In 1808 an abortive attempt to capture it was made by the French; they succeeded, however, in 1812, and held it till June 1813. Queen Christina signed her abdication at Valencia in 1840.

VALENCIA, a city of Venezuela and capital of the state of Carabobo, 111 m. by rail W.S.W. of Caracas, and 24 m. direct ($33\frac{1}{2}$ m. by rail) S. by E. of Puerto Cabello. Pop. (1894) 38,654. There is railway connexion with Caracas by the Great Venezuela line (German) and with Puerto Cabello by the Puerto Cabello and Valencia line (English), which crosses the N. range of the Maritime Andes. There is also a steamboat service on Lake Valencia. The city is situated on the N.W. border of a lacustrine plain occupied in great part by Lake Tacarigua, or Valencia,[1] and nearly 2 m. from its western margin. It is beautifully situated in a large fertile valley between parallel ranges of the Maritime Andes, about 1625 ft. above sea-level, and in the midst of rich plantations and luxuriant tropical vegetation. The climate is mild and pleasant, the temperature ranging from 66° to 87° F. with an annual mean of 76°, and the rainfall being about the same as that of Caracas, or 23 to 30 in. Near Valencia on the Puerto Cabello railway are the Las Trincheras thermal springs. Among Valencia's public edifices and institutions are some good churches, the government palace, a university, a national college for women, a normal school for men and a public library.

Valencia was founded in 1555 and is older than Caracas. It was occupied for a time in 1561 by Aguirre and his band of outlaws. At the beginning of the War of Independence it was made the capital of Venezuela, and the patriot congress was in session there in 1812 when Caracas was destroyed by an earthquake. It changed masters several times during the war, its most famous events being two successful defences in 1814 against Spanish besieging forces. The town suffered much in the war and from subsequent revolutions, but the remarkable productiveness of the surrounding districts and its advantageous commercial position ensured a prompt recovery from all reverses.

VALENCIA DE ALCÁNTARA, a town of western Spain, in the province of Cáceres; on the Madrid-Cáceres-Lisbon railway, near the right bank of the Sever, a small stream which here divides Spain from Portugal. Pop. (1900) 9417. Valencia de Alcántara is the most important custom-house for direct traffic between the Peninsular kingdoms except Badajoz, and has a flourishing trade in farm produce of all kinds, and in phosphates from the neighbouring mines. The town is occupied by a garrison, and retains its old-fashioned loopholed walls and dismantled citadel. A Roman aqueduct still brings water to the main street, and there are other Roman remains in the district; the courtyards and windows of many houses are Moorish in style. The interesting church of Roqueamador dates from the 14th century, the church of Encarnacion, the town hall and a fine convent, from the 16th. From the 16th century to the 18th Valencia was a celebrated border fortress; it was captured by the Portuguese in 1664 and 1698.

VALENCIENNES, a town of northern France in the department of Nord on the Scheldt, at its confluence with the Rhônelle, 30 m. S.E. of Lille by rail. Pop. (1906), town, 25,977; commune, 31,759. The Scheldt here divides into two branches, one of which flows through the town, while the other, canalized and forming a port, skirts it on the west. Of the fortifications, dismantled in 1892, and replaced by boulevards, the Tour de la Dodenne (13th and 15th centuries) and the citadel (17th century) are the chief remains. Valenciennes is the centre of a rich coal-field, to which Anzin (*q.v.*), an industrial town a little over a mile to the north-west, has given its name. To this fact is due the existence of the important foundries, forges, rolling-mills, wire-works and machine shops which line the bank of the Scheldt. There is also an extensive beetroot cultivation, with attendant sugar-works and distilleries, and glass, starch, chemicals and soap are produced. Hosiery, trimmings and handkerchiefs are manufactured and cotton weaving and printing are carried on, though little of the famous lace is now made. Other industries are brewing and malting. There are a sub-prefecture, courts of first instance and of commerce, a chamber of commerce, a board of trade arbitration, and a branch of the Bank of France, a lycée, a school of music and a school of fine art (founded in 1782). The town hall is a fine building of the early 17th century, but its façade was rebuilt in 1867 and 1868. The museum contains galleries of painting and sculpture, with works by Antoine, Louis and François Watteau, Carpeaux, all of whom were natives of the town, and by Rubens and other Flemish artists. Opposite the museum there is a monument commemorating the defence of the town in 1793. The principal church is that of Notre-Dame du Cordon, a fine modern building in the Gothic style surmounted by a tower 272 ft. in height. The church of St Géry preserves a few pillars dating from the 13th century. Near it stands the statue of Antoine Watteau, and there is also a statue of Jean Froissart, born at Valenciennes.

Valenciennes is said to owe its name and foundation to one of the three Roman emperors named Valentinian. In the middle ages it was the seat of a countship which in the 11th century was united to that of Hainaut. In the 16th century Valenciennes

[1] Lake Valencia occupies one of the so-called Aragua valleys, enclosed between the parallel ranges of the Maritime Andes. It is 1348 ft. above the sea, is about 30 m. long, has an area of 216 sq. m., and a catchment basin of 1782 sq. m., and lies partly in the state of Aragua. It includes a number of small islands, some inhabited, and receives the waters of a score of small streams from the surrounding mountains.

became the stronghold of Protestantism in Hainaut, but was conquered by the Spaniards, who committed all sorts of excesses. In 1656 the Spaniards under Condé made a successful defence against the French under Turenne; but in 1677 Louis XIV. took the town after an eight days' siege, and Vauban constructed the citadel. Valenciennes, which then became the capital of Hainaut, has since always belonged to France. In 1793, after forty-three days' bombardment, the garrison, reduced to 3000 men, surrendered to the allied forces numbering some 140,000 or 150,000 men, with 400 cannon. In 1815 it defended itself successfully.

VALENCY. The doctrine of valency, in chemistry, may be defined as the doctrine of the combining power of the atoms or elementary radicles of which compound molecules consist. The conception that each elementary atom has a definite atom-fixing power, enunciated by Frankland in 1852, is the foundation of the system of rational or structural formulae which now plays so great a part in chemical science. Frankland dealt more particularly with the valency of the metallic elements, in which he was specially interested at the time; but in conjunction with his co-worker Kolbe, he subsequently applied it to compounds of carbon. At that time (1852–56), the application of Avogadro's theorem to the determination of atomic weights was not yet recognized; it was only when Cannizzaro[1] made this clear that it became possible to develop the doctrine of valency upon a consistent basis. Kekulé, whose services in this field rank with those of Frankland, was the first to develop the consequences of the conception that carbon is a quadrivalent element and to apply it in a logical manner to the explanation of the structure of carbon compounds generally; his paper published in 1858, "On the Constitution and Metamorphoses of Chemical Compounds and on the Chemical Nature of Carbon," is admittedly the foundation of the modern theory of the structure of these compounds.

An admirable though brief summary of the historical development of the doctrine of valency is to be found in the lecture delivered in 1898 by Professor Japp in memory of Kekulé (*Journ. Chem. Soc.* 73, p. 97). Several discoveries have since been made which have an important bearing on the doctrine.

Frankland held that each element has a certain maximum valency but may manifest one or more subordinate valencies, the affinities in abeyance in cases in which only the lower valency is manifest satisfying each other mutually. By a logical extension of this view, elements have been divided into those of odd and those of even valency; apart from a few exceptional compounds, elements are to be reckoned as belonging either to the one or to the other of these two classes.

Kekulé always maintained that valency could not vary and in discussing this question Professor Japp goes so far as to say: "Of all the doctrines which we owe to Kekulé, that of fixed valency is probably the one that has met with least acceptance even among chemists of his own school. At the present day it is, so far as I am aware, without supporters." But he adds, "Yet Kekulé held it to the last." And such a fact cannot be overlooked: that Kekulé went too far in asserting that valency could not vary is probably true; the essential feature in his objection—that in many cases valency was overestimated by the Frankland school—cannot be so easily disposed of.

He saw clearly that structure is the determining factor to be taken into account in all such discussions; he also considered that it was necessary always to make use of univalent or monad elements in determining valency; moreover, that the only compounds on which valid arguments could be based were those which could be volatilized without undergoing decomposition—a condition that must be fulfilled if the molecular weight of a compound is to be placed beyond question. He therefore objected to the use of compounds such as ammonium chloride and phosphorus pentachloride as criteria of valency, as they undergo decomposition when volatilized. This objection has been somewhat robbed of its force by Brereton Baker's observation that decomposition can be prevented if the utmost care be taken to exclude moisture. In objecting to the use of such compounds, however, Kekulé took the further important step of dividing compounds into two classes—that of atomic compounds, such as ammonia and hydrogen chloride, in which the components are held together by atomic affinities; and that of molecular compounds, such as ammonium chloride, containing atomic compounds held together by molecular affinities: but Kekulé never gave any very clear explanation of the difference. Notwithstanding Brereton Baker's observations, the question remains with us to-day, the only difference being that we have substituted the more precise term "residual affinity" for Kekulé's term "molecular affinity."

Hydrogen is the one element which at present can be affirmed to be of unvarying valency: as no compound of determinable molecular weight is known in which a single atom of this element can be supposed to be present in the molecule in association with more than a single atom of another element, the hydrogen atom may be regarded as a consistent univalent or monad radicle. As the element of unit valency, hydrogen is, therefore, the one fit atomic measure to be used in ascertaining valency; unfortunately, it cannot always be applied, as so few elements form volatile hydrides. Hydrocarbon radicles such as methyl, CH_3, however, are so entirely comparable with the hydrogen radicle that they form equally efficient standards; as many elements form volatile methides, some assistance may be obtained by the use of such radicles. But in all other cases the difficulty becomes very great; indeed, it is doubtful if a trustworthy standard can then be found—we are still forced, in fact, to recognize the wisdom of Kekulé's contentions. The greatest difficulty of all that we have to meet is due to the fact that valency is a dependent variable in the case of many if not of most elements, the degree in which it is manifest depending on the reciprocal affinities of the associating elements, as well as on environmental conditions.

Among univalent elements, carbon is the only one that appears to have a determinate maximum valency; this is manifest in methane, CH_4, the simplest hydride the element forms, the first parent of the mighty host of compounds numbering thousands upon thousands which are the subject-matter of organic chemistry. Carbon, it is well known, is distinguished from all other elements by forming a great variety of compounds with hydrogen—the hydrocarbons; from these, in turn, other series of compounds are formed by the displacement of hydrogen atoms in the hydrocarbons by various radicles. The chemistry of the carbon compounds is, in fact, the chemistry of substitution compounds; no other element can be said to give rise to substitution compounds. It is because of this fact—because of the simple relationship obtaining between the various series of hydrocarbons and between these and their substitution compounds—that we are able to deduce structural formulae for carbon compounds with a degree of certainty not attainable in the case of any other element; and we are consequently able to infer the valency of carbon with a degree of definiteness that cannot be approached in any other case. Several of the simpler derivatives of carbon exhibit peculiarities which may be referred to as of particular interest, as showing how difficult it is to arrive at any understanding of the manner in which valency is exercised. Apparently the compound represented by the symbol CH_2 cannot exist, all attempts to isolate it having failed, the hydrocarbon ethylene, formed by the union of two such groups, being obtained in its place. This would be in no way surprising were it not that the corresponding oxygenated compound, carbon monoxide, CO, has no tendency whatever to undergo polymerization under ordinary conditions and is, in fact, speaking generally, a remarkably inert substance, although in certain cases it forms compounds without difficulty—yet always in a very quiet manner. A single atom of oxygen apparently has the power, if not of satisfying, at least of stilling the needs of the carbon atom. One other case which makes the behaviour of carbon monoxide still more exceptional may be referred to, that of the analogous sulphur compound carbon monsulphide, CS, recently discovered by Sir James Dewar and Mr H. O.

Jones. This compound is so unstable, so active, that it polymerizes with explosive violence at temperatures slightly above that at which liquid air boils. Such illustrations afford clear proof that, as before mentioned, valency is a reciprocal function—that it is impossible to regard the units of affinity of the atoms of different elements as of equivalent value and capable of satisfying each other mutually.

There is no reason to suppose that an uneven number of affinities can be active in the carbon atom; in devising structural formulae, it is therefore always considered necessary to account for the disposition of the four units of affinity, the four valencies, of the carbon atom. In 1900 some excitement was aroused by the discovery by Gomberg of a remarkable hydrocarbon formed by the withdrawal of the chlorine atom from chlorotriphenylmethane, $C(C_6H_5)_3Cl$: at first it was contended that this was a compound of triad carbon, *triphenylmethyl*; it is now generally admitted, however, that such cannot well be the case and that one of the phenyl groups becomes altered in structure and converted into a dyad radicle (see TRIPHENYLMETHANE).

The homologues of methane—the hydrocarbons of the paraffin or C_nH_{2n+2} series, in which the carbon atoms are associated by single affinities, their remaining affinities being engaged by hydrogen atoms—behave chemically as saturated compounds and are apparently incapable of entering into combination with other molecules. But it is important to guard against the assumption that they are actually saturated in any absolute sense. Even gases such as helium and argon, destitute as they appear to be of all chemical activity, must be credited with the possession of some measure of affinity—as they can be liquefied; moreover, as Sir James Dewar has shown, when helium is liquefied in contact with charcoal a not inconsiderable amount of heat is liberated beyond that given out in the mere liquefaction of the gas. The argument may be extended to hydrogen and the paraffins and it may even be supposed that the amount of residual affinity increases gradually as the series is ascended—this would account for the fact that their activity, the readiness with which they are attacked, increases slightly as the series is ascended. In any case, it cannot well be supposed that carbon and hydrogen mutually satisfy each other even in the paraffins.

The manner in which the valencies of the carbon atom are disposed of in the case of unsaturated hydrocarbons—that is to say, those containing a lower proportion of hydrogen than is indicated by the formula C_nH_{2n+2}—has given rise to much discussion, the subject being one which affords an opportunity for great difference of opinion. In ethylene, C_2H_4, each carbon atom is attached to only two hydrogen atoms, as two affinities of each atom are therefore free to enter reciprocally into combination. These atoms certainly do not combine twice over in the way in which the two atoms of carbon in ethane, $H_3C{\cdot}CH_3$, enter into combination—if they did, ethylene should be a saturated compound, whereas actually it behaves as an eminently unsaturated substance. It was contended by Julius Thomsen, on the basis of determinations of the heat of combustion of the hydrocarbons, that the two carbon atoms in ethylene are less firmly united in ethylene than are those in ethane; moreover, that in acetylene, C_2H_2, in which there are three affinities at the disposal of each of the two carbon atoms, the union is even less firm than in ethylene. The argument on which these conclusions are founded has been called in question and the data are clearly insufficient to justify their acceptance; moreover, the stability of acetylene at high temperatures, also the readiness with which ethylene is often formed and with which ethenoid compounds revert to the paraffin type may be cited as arguments against them.

In dealing with such a problem, it is necessary to take into account the evidence we have that valency is a directed function. The tetrahedron is now accepted as the most suitable model of the carbon atom to be visualized whenever carbon is thought of; moreover, it is held that the directions in which valency acts are appropriately pictured if they are regarded as proceeding from the centre of mass to the four solid angles of the tetrahedron. In such a case, two affinities proceeding from each of two carbon atoms do not meet and overlap but cross, each pair at a considerable angle through which they must be deflected to bring them into contact. Von Baeyer has suggested that this angle, $\frac{1}{2}(109° 28')$, is the measure of the strain imposed upon the affinities and that the existence of this strain affords an explanation of the readiness with which ethylene lapses into a derivative of ethane when suitable opportunity is given to combine with some other substance. Another way of looking at the matter is to suppose that the affinities do not, as it were, overlap but merely cross each other and that the angle of approach referred to is a direct measure of the degree of unsaturatedness: such a view is more in accordance with Thomsen's contention. In any case, the ethenoid condition of unsaturatedness at the junction of two carbon atoms is a centre at which altogether peculiar properties, chemical and physical, are developed—the most noteworthy being the enhanced refractive power. The ethenoid symbol $C=C$ is therefore of peculiar significance. It is a remarkable fact that the properties of ring systems generally are in accordance with the above hypothesis—the degree of unsaturatedness diminishing as "the angle of approach" is diminished, the more nearly the affinities can be pictured as overlapping.

The most stable arrangement of the carbon affinities would appear to be that in benzene and compounds of the benzene type—whatever that may be. The determination of the "structure" of this hydrocarbon has given rise to a large amount of paper warfare. Two tendencies may be said to have been brought together in the course of this discussion: on the one hand, the desire to arrive at a determination of the actual structure; on the other, the desire to devise formulae which shall be faithful expressions of functional behaviour and broadly indicative of the structural relationship of the constituent elements. The latter is perhaps the tendency which is now in the ascendant: we are beginning to realise, particularly in the case of carbon compounds, that formulae are primarily expressive of behaviour—being based on the observation of behaviour. Thus in the case of all paraffinoid compounds, the symbol $C{-}C$ has a distinctive meaning, as indicating saturation; in the case of ethenoid compounds, the symbol $C=C$ has an equally distinctive meaning, indicating a particular degree of unsaturatedness.

From this point of view, therefore, the benzene symbol originally proposed by Kekulé is misleading, inasmuch as it indicates that the hydrocarbon contains three ethenoid junctions; it should therefore be an eminently unsaturated compound, which is not the case. On this account the centric formula is to be preferred as an expression of the properties of the compound.

The non-metallic elements other than carbon all form volatile hydrides and methides from which their fundamental valencies can be deduced without difficulty. Chlorine, oxygen, nitrogen and silicon may be regarded as typical of the four classes into which the non-metals fall. But the number of hydrogen and methyl radicles which the atom carries cannot be taken as the measure of absolute valency in the case of elements of the chlorine, oxygen and nitrogen classes. The hydrides of the elements of these classes must all be regarded as more or less unsaturated compounds, the fact that gases such as hydrogen chloride and ammonia are intensely soluble in water being clearly a proof that their molecules are greatly attracted by and have great attraction for water molecules; it is remarkable, however, that although hydrogen chloride and ammonia are easily soluble in water and also combine readily with one another, they are gases which are by no means easily condensed—in other words, the molecules in each gas have little tendency to associate among themselves. It may also be pointed out that, to account for the properties of liquid water, it is necessary to suppose that the simple molecules represented by the symbol H_2O have a very considerable mutual affinity and that water consists largely of complex molecules.[1] Taking into account

[1] On this account it is desirable to confine the term water to the liquid and to distinguish the simple molecule represented by the symbol H_2O by a separate name—that proposed is *Hydrone*. Liquid water is probably a mixture of several polyhydrones together with more or less hydrone.

the estimate we are able to form, on the one hand, of the functions of hydrogen, on the other of those of elements such as chlorine, oxygen and nitrogen, it seems probable that in the hydrides of these elements the extra attractive power is exercised entirely by the element which enters into combination with the hydrogen—in other words, that chlorine in hydrogen chloride, oxygen in hydrone and nitrogen in ammonia are each possessed of considerable residual affinity. The great question at issue has been and still is—What is the nature of this residual affinity and how is it exercised? This is the question raised by Kekulé and left by him as a legacy to be decided upon. When hydrogen chloride and ammonia enter into combination to form ammonium chloride, for example, do they combine in some special manner, molecularly, so that each molecule retains its individuality as a radicle in the new compound; or is a redistribution effected, so that the several atoms become arranged around the one which exercises the dominant influence much as they are in the parent compound ammonia? In the former case, two orders of affinity would come into operation; in the latter, only one. The general opinion has always been in favour of the latter view.

The discovery that compounds of sulphur containing four different monad radicles together with a single sulphur atom, such as the chloride, $S(CH_3)(C_2H_5)(CH_2 \cdot CO_2H)Cl$, are optically active may be said to have set the question at rest, as optical activity is only to be expected in the case of a compound of asymmetric structure having the four radicles separately associated with and arranged around the sulphur atom. If it be granted that sulphur can thus function as a tetrad, it may equally be admitted that nitrogen can function as a pentad element in the ammonium compounds.

The discussion has entered on another stage, however, now that Barlow and Pope have been successful in subjecting the problem to geometric treatment by correlating crystalline form with chemical constitution. The fundamental conception upon which the relationship is based is that each atom present in a compound occupies a distinct portion of space by virtue of an influence which it exerts uniformly in every direction. A crystalline structure is regarded as a close-packed, homogeneous assemblage of the spheres of influence of the component atoms. According to this view, valency acquires volume significance. For example, the hydrogen atom being represented by a sphere of unit volume, that of the tetrad carbon atom is represented by one of four times this unit volume; the monad elements —chlorine, bromine and iodine—are supposed, in like manner, to occupy approximately unit spheres of influence. Whilst they are prepared to admit that the spheres of atomic influence of the univalent elements, for example, are not quite the same —moreover, that the volume ratios of the spheres of influence of various elements may alter slightly under changes of condition— Barlow and Pope contend that the relative magnitudes are only slightly affected in passing from compound to compound. In their view, however, the absolute magnitudes of the spheres of influence often change considerably.

For example, taking the spheres of atomic influence of carbon as of volume 4 and those of hydrogen, chlorine and bromine as of volume 1, they find that benzene, C_6H_6, hexachlorobenzene, C_6Cl_6, and hexabromobenzene, C_6Br_6, present an almost identical spatial arrangement of the spheres of atomic influence. This could not be the case if the atoms of carbon, hydrogen, chlorine and bromine appropriated respectively the volumes 11·0, 5·5, 22·8 and 27·8—the so-called atomic volumes deduced by Kopp. Barlow and Pope therefore consider that, both in benzene of molecular volume 77·4 and in a derivative such as tetrabromobenzene of molecular volume 130·2, the sphere of influence of the carbon atom is about four times as large as that of either hydrogen or bromine; on displacing the hydrogen atoms by bromine atoms, however, the volumes of the carbon atoms in the benzene molecule and of the remaining hydrogen atoms expand proportionally in the ratio of 77·4 : 130·2. This remarkable conclusion is a most helpful addition to the doctrine of valency. The relative fundamental valency volume, according to Barlow and Pope, is a constant—when compounds of a "higher type" are produced, greater number of atoms become arranged about the centralizing atom but the relative valency volumes do not change. They have shown that if an atom of valency 1 be inserted into the space already occupied by an atom of valency m, a gap is produced which must be filled up by another atom of valency 1 if the close packing is to be restored without remarshalling, thus accounting for the progression of valency by two units. Ammonium chloride, for example, is to be regarded as formed by the insertion into the ammonia assemblage of a chlorine atom of volume 1 and of an atom of hydrogen of volume 1, the nitrogen atom retaining its fundamental valency 3. This geometric conception affords a justification of Kekulé's conception of fixed valency; at the same time it gives expression to the view he advocated that a distinction was to be drawn between atomic and molecular compounds; but it also supports the contention of Kekulé's opponents that in the two classes of compound the atoms must be regarded equally as arranged about a centralizing atom. The two points of view are therefore brought into harmony. But the problem is by no means solved—other modes of arrangement than those pictured must also be possible. To take the case of a solution of ammonia, for example: it is generally admitted that only a very small proportion is present as the hydroxide $NH_4 \cdot OH$; far the greater part must be held in solution in some other form, either as $H_3N = OH_2$ or in the form of more complex molecules of the polymethylene type. These may be regarded as Kekulé's molecular compounds and as the forerunners of the "more organized" compounds in which the atoms are centralized in the crystal structure. It has not been found necessary hitherto to attribute spheres of atomic influence of different relative volumes to the same element under different conditions—that is to say, elements such as sulphur and nitrogen always exhibit the fundamental valencies 2 and 3 respectively; moreover, in the case of per- and proto-metallic salts all known facts accord with the assumption of one and only one fundamental valency of the metal. One other conclusion of interest which Barlow and Pope are inclined to draw may be referred to, namely, that although silicon apparently functions as a tetrad element, its relative valency volume is probably only 2; they even question whether any element other than carbon has a valency volume four times that of hydrogen. It may well be that the peculiar stability of carbon compounds is to be sought in this peculiarity.

The Barlow-Pope hypothesis, however, affords a purely static representation of the facts: we are still unable to apply dynamic considerations to the explanation of valency. From the time of Faraday onwards, chemists have been willing to regard chemical affinity as electrical in its origin; on this account, the atomic-charge hypothesis advocated by Helmholtz has been most favourably received: but this hypothesis does not in any way enable us to understand the many qualitative peculiarities which are apparent when the reciprocal affinities of various elements are taken into account; moreover, it affords no explanation of the apparent variations in valency which are so frequently manifest; and it affords no satisfactory explanation of the fact that many compounds of like radicles, such as the elementary gases hydrogen, nitrogen and chlorine, for example, are among the most stable compounds known— more stable than many compounds consisting of elements of opposite polarity. Attempts have been made of late to apply the electronic hypothesis—these attempts, however, have involved little more than a paraphrase of current static views and they are in no way helpful in the directions in which help is most needed. It is no way surprising, however, that we should know so little of the origin of a property that may be said to be the fundamental property of matter—if we could explain it, we could explain most things; what we have reason to be surprised at is that it should have been possible to develop so consistent a doctrine as that now at our disposal.

It is scarcely necessary to point out that the sketch above given is but a bare outline of the subject, one in which attention is drawn to certain points of importance in the hope that it may be clear that the problems cannot be discussed usefully in the formal manner which is too frequently adopted. Our knowledge of valency cannot be expressed in a few symbols or in a few formal statements. (H. E. A.)

VALENS, East Roman emperor from 364 to 378, owed his elevation in the thirty-sixth year of his age to his brother Valentinian, who chose him to be his associate in the empire, of which a formal division into East and West was now once for all definitively arranged (see VALENTINIAN I.). Valens had been attached to Julian's bodyguard, but he did not inherit the military ability of his father, Gratian of Pannonia, who had risen from the ranks to a high position. A revolt headed by Procopius in the second year of his reign, and backed up by the public opinion of Constantinople and the sympathy of the Gothic princes and chiefs on the Danube, seemed so alarming to him that he thought of negotiation; but in the following year the revolt collapsed before the firmness of his ministers and generals. In the year 366 Valens at one stroke reduced the taxes of the empire by one-fourth, a very popular measure, though one of questionable policy in the face of the threatening attitude of the Goths on the lower Danube. Before venturing on a campaign against them, Valens received baptism from Eudoxus, the bishop of Constantinople and the leader of the Arian party. After some small successes over the Goths, won by his generals (367–9), Valens concluded a peace with them, which lasted six years, on a general understanding that the Danube was to be the boundary between Goths and Romans. On his return to Constantinople in 369–70 Valens began to persecute his orthodox and Catholic subjects, but he lacked the energy to carry out his edicts rigorously.

In the years 371 to 377 Valens was in Asia Minor, most of the time at the Syrian Antioch. Though anxious to avoid an Eastern war, because of danger nearer home from the restlessness of the Goths, he was compelled to take the field against Shapur II. who had invaded and occupied Armenia. It seems that Valens[1] crossed the Euphrates in 373, and in Mesopotamia his troops drove back the king of Persia to the farther bank of the Tigris. But the Roman success was by no means decisive, and no definite understanding as to boundaries was come to with Persia. Valens returned to Antioch, where in the winter of 373–4 he instituted a persecution of magicians and other people whom he foolishly believed to imperil his life. Between 374 and 377 we read of grievous complaints of injustice and extortion perpetrated under legal forms, the result probably of the recent panic, and pointing to an increasing weakness and timidity at headquarters. Although preparations were made for following up the war with Persia and securing the frontier, a truce was patched up, rather to the disadvantage of the empire, Armenia and the adjacent country being half conquered and annexed by Shapur. The armies of Rome, in fact, were wanted in another quarter. The Huns, of whom we now hear for the first time, were beginning in 376 to press the Goths from the north, and the latter asked leave of the emperor to cross the Danube into Roman territory. This they were allowed to do, on the condition that they came unarmed, and their children were transported to Asia as hostages. The conditions, however, were not observed by the imperial generals, who for their own profit forced the new settlers to buy food at famine prices. Accordingly, the enraged Goths, under their chief Fritigern, streamed across the Balkans into Thrace and the country round Adrianople, plundering, burning and slaughtering as they went. They were driven back for a time, but returned in the spring of 378 in greater force, with a contingent of Huns and Alans; and again, after some repulses, they penetrated to the neighbourhood of Adrianople. Valens, who had now returned to Constantinople, left the capital in May 378 with a strong and well-officered army. Without awaiting the arrival of his nephew Gratian, emperor of the West, who had just won a great victory over one of the barbarous tribes of Germany in Alsace, Valens attacked the enemy at once, although his troops had to go into action heated and fatigued by a long march on a sultry August day. The battle, which was fought on confined ground in a valley, was decided by a cavalry charge of the Alans and Sarmatians, which threw the Roman infantry into confusion and hemmed it in so closely that the men could scarcely draw their swords. The slaughter, which continued till the complete destruction of the Roman army, was one of the greatest recorded in antiquity. Valens either perished on the field, or, as some said, in a cottage fired by the enemy. From the battle of Adrianople the Goths permanently established themselves south of the Danube.

[1]Amm. Marc. xxix. 1; the narrative is brief and not very clear.

See Ammianus Marcellinus, bks. 26–31; E. Gibbon, *The Decline and Fall of the Roman Empire* (ed. Bury, London, 1896), chs. 25–26; W. Judeich in *Deutsche Zeitschrift für Geschichtswissenschaft* (1891), pp. 1–21.

VALENTIA, SIR FRANCIS ANNESLEY, VISCOUNT (1585–1660), Anglo-Irish statesman, son of Robert Annesley of Newport Pagnel in Buckinghamshire, was born in 1585, and settled in Ireland at an early age, acquiring property in various parts of the island. His friendship with the lord deputy, Sir Arthur Chichester, procured for him government employment and the favour of King James I., who conferred on him a grant of the land and fort of Mountnorris, county Armagh, in 1612. He was returned to the Irish parliament by the county Armagh in 1614, and four years later was appointed secretary for Ireland, being created a baronet in 1620. In the following year he received, by an unusual patent, a reversionary grant of the viscountcy of Valencia after the death without male issue of a kinsman (Sir Henry Power, created viscount of Valentia in 1621), the then living viscount. In 1625 Sir Francis Annesley was elected member for the county of Carmarthen in the English parliament; and in the same year he was made vice-treasurer and receiver-general of Ireland. In 1628 he was created Baron Mountnorris in the peerage of Ireland. He strongly opposed the policy of Lord Falkland, who became lord deputy in 1622, and procured his recall in 1629. When Sir Thomas Wentworth, afterwards the famous earl of Strafford, went to Ireland in 1633, he took action against Mountnorris, whom he accused of corruption and malversation of public money. The two men became violent opponents, and at a dinner at the lord chancellor's house in April 1635 Mountnorris used insulting and threatening language in reference to the lord deputy. Wentworth brought him before a court-martial on a charge of insubordination as an officer in the army, and by this tribunal Mountnorris was condemned to death. The sentence was not carried out, but he was imprisoned and deprived of all his offices on the report of a committee appointed by the privy council to inquire into the charges of corruption. The vindictiveness of the proceedings against Mountnorris, which afterwards constituted one of the counts in the impeachment of Strafford, has been strongly condemned by some historians and extenuated by others; that the trial by court-martial and the sentence were at all events not illegal, has been shown by S. R. Gardiner. Mountnorris was not long detained in prison, and in 1640 his relations with Strafford were examined by a committee of the Long Parliament, which pronounced the sentence passed on him unjust and illegal. In 1642 he succeeded, under the above-mentioned reversion, to the title of viscount of Valentia. During the Commonwealth he again held the post of secretary in Ireland to the lord deputy, Henry Cromwell, with whom he was on friendly terms. Valentia died in 1660. His wife was Dorothy, daughter of Sir John Phillipps of Picton, Pembrokeshire, by whom he was the father of Arthur Annesley, earl of Anglesey (*q.v.* for later history).

See S. R. Gardiner, *History of England*, vol. viii. (London, 1883–84); Strafford's *Letters and Dispatches*, edited by W. Knowler (2 vols., Dublin, 1740); G. E. C., *Complete Peerage*, vol. v. (London, 1893).

VALENTINE, or VALENTINUS, the name of a considerable number of saints. The most celebrated are the two martyrs whose festivals fall on the 14th of February—the one, a Roman priest, the other, bishop of Terni (Interamna). The *Passion* of the former is part of the legend of SS. Marius and Martha and their companions; that of the latter has no better historical foundation: so that no argument can be drawn from either account to establish the differentiation of the two saints. It would appear from the two accounts that both belonged to the same period, *i.e.* to the reign of the emperor Claudius (Gothicus); that both died on the same day; and that both were buried on the Via Flaminia, but at different distances from Rome. The *Martyrologium Hieronymianum* mentions only one Valentinus: "Interamnae miliario LXIIII. via Flaminia natale Valentini." It is probable that the basilica situated at the second milestone on the Via Flaminia was also dedicated to him. It is impossible to fix the date of his death. The St Valentinus who is spoken of as the apostle of Rhaetia, and venerated in Passau as its first bishop, flourished in the 5th century. Although the name of St Valentine is very popular in England, apparently no church has been dedicated to him. For the peculiar observances that used to be commonly connected with St Valentine's Eve and Day, to which allusion is frequently made by English writers, such works as John Brand's *Popular Antiquities* (edited by W. C. Hazlitt, vol. ii. pp. 606–11, London, 1905), W. Hone's *Every-Day Book*, and Chambers's *Book of Days* may be consulted. Their appropriateness to the spring season is, in a general way perhaps, obvious enough, but the association of the lovers' festival with St Valentine seems to be purely accidental.[1]

See *Acta Sanctorum*, February, ii. 753, 756, and January, i. 1094; G. B. de Rossi, *Bullettino di archeologia cristiana* (1871), p. 101 and (1878) p. 59. (H. De.)

VALENTINE AND ORSON, a romance which has been attached to the Carolingian cycle. It is the story of twin brothers, abandoned in the woods in infancy. Valentine is brought up as a knight at the court of Pippin, while Orson grows up in a bear's den to be a wild man of the woods, until he is overcome and tamed by Valentine, whose servant and comrade he becomes. The two eventually rescue their mother Bellisant, sister of Pippin and wife of the emperor of Greece, by whom she had been unjustly repudiated, from the power of a giant. There are versions of the tale, which appears to rest on a lost French original, in French, English, German, Icelandic, Dutch and Italian. In the older versions Orson is described as the "nameless" one. The kernel of the story lies in Orson's upbringing and wildness, and is evidently a folk-tale the connexion of which with the Carolingian cycle is purely artificial. The story of the wife unjustly accused with which it is bound up is sufficiently common, and was told of the wives both of Pippin and Charlemagne.

The French prose romance was printed at Lyons in 1489 and often subsequently. *The Historye of the two Valyannte Brethren: Valentyne and Orson* . . . by Henry Watson, printed by William Copland about 1550, is the earliest known of a long series of English versions. A ballad on the subject was printed in Bishop Percy's *Reliques of English Poetry*, and the tale adapted for the nursery was illustrated by Walter Crane in the *Three Bears' Picture Book* (1876). For a detailed bibliography of the English, French, German, Dutch and Italian forms of the tale, see W. Seelman, "Valentin und Namelos" (Norden and Leipzig, 1884), in vol. iv. of *Niederdeutsche Denkmäler*, edited by the Verein für niederdeutsche Sprachforschung.

VALENTINIAN I., Roman emperor of the West from A.D. 364 to 375, was born at Cibalis, in Pannonia. He had been an officer of the guard under Julian and Jovian, and had risen high in the imperial service. Of robust frame and distinguished appearance, he possessed great courage and military capacity. He was chosen emperor in his forty-third year by the officers of the army at Nicaea in Bithynia in 364, and shortly afterwards named his brother Valens (*q.v.*) colleague with him in the empire. The two brothers, after passing through the chief cities of the neighbouring district, arranged the partition of the empire at Naissus (Nissa) in Upper Moesia. As emperor of the West, Valentinian took Italy, Illyricum, Spain, the Gauls, Britain and Africa, leaving to Valens the eastern half of the Balkan Peninsula, Greece, Egypt, Syria and Asia Minor as far as Persia. During the short reign of Valentinian there were wars in Africa, in Germany and in Britain, and Rome came into collision with barbarian peoples of whom we now hear for the first time—Burgundians, Saxons, Alamanni. The emperor's chief work was guarding the frontiers and establishing military positions. Milan was at first his headquarters for settling the affairs of northern Italy; next year (365) he was at Paris, and then at Reims, to direct the operations of his generals against the Alamanni. This people, defeated at Scarpona (Charpeigne) and Catelauni (Châlons-sur-Marne) by Jovinus, were driven back to the German bank of the Rhine, and checked for a while by a chain of military posts and fortresses. At the close of 367, however, they suddenly crossed the Rhine, attacked Moguntiacum (Mainz) and plundered the city. Valentinian attacked them at Solicinium (Sulz in the Neckar valley or Schwetzingen) with a large army, and defeated them with great slaughter, but his own losses were so considerable that he abandoned the idea of following up his success. Later, in 374, he made peace with their king, Macrianus, who from that time remained a true friend of the Romans. The next three years he spent at Trier, which he chiefly made his headquarters, organizing the defence of the Rhine frontier, and personally superintending the construction of numerous forts. During his reign the coasts of Gaul were harassed by the Saxon pirates, with whom the Picts and Scots of northern Britain joined hands, and ravaged the island from the wall of Antoninus to the shores of Kent. In 368 Theodosius was sent to drive back the invaders; in this he was completely successful, and established a new British province, called Valentia, in honour of the emperor. In Africa the Moorish prince, Firmus, raised the standard of revolt, being joined by the provincials, who had been rendered desperate by the cruelty and extortions of Count Romanus, the military governor. The services of Theodosius were again requisitioned. He landed in Africa with a small band of veterans, and Firmus, to avoid being taken prisoner, committed suicide. In 374 the Quadi, a German tribe in what is now Moravia and Hungary, resenting the erection of Roman forts to the north of the Danube in what they considered to be their own territory, and further exasperated by the treacherous murder of their king, Gabinius, crossed the river and laid waste the province of Pannonia. The emperor in April of the following year entered Illyricum with a powerful army, but during an audience to an embassy from the Quadi at Brigetio on the Danube (near Pressburg) died in a fit of apoplexy. His general administration seems to have been thoroughly honest and able, in some respects beneficent. If he was hard and exacting in the matter of taxes, he spent them in the defence and improvement of his dominions, not in idle show or luxury. Though himself a plain and almost illiterate soldier, he was a founder of schools, and he also provided medical attendance for the poor of Rome, by appointing a physician for each of the fourteen districts of the city. He was an orthodox Catholic, but he permitted absolute religious freedom to all his subjects. Against all abuses, both civil and ecclesiastical, he steadily set his face, even against the increasing wealth and worldliness of the clergy. The great blot on his memory is his cruelty, which at times was frightful, and showed itself in its full fierceness in the punishment of persons accused of witchcraft, soothsaying or magical practices.

See Ammianus Marcellinus xxv.–xxx.; Gibbon, *Decline and Fall*, chap. 25; T. Hodgkin, *Italy and her Invaders*, bk. i. chap. 3; H. Schiller, *Geschichte der römischen Kaiserzeit* (Gotha, 1883–87), bk. iii. chap. iv. 27–30; H. Richter, *Das weströmische Reich* (Berlin, 1865), pp. 240–68.

After his death, his son, VALENTINIAN II., an infant of four years of age, with his half-brother Gratian (*q.v.*) a lad of about seventeen, became the emperors of the West. They made Milan their home; and the empire was nominally divided

[1] Until nearly the close of the 19th century the custom of sending "valentines"—*i.e.* anonymous love-tokens, written or otherwise—on St Valentine's day was fairly general. They gradually lost their original significance, and the custom, where it survives, has become completely vulgarized.

between them, Gratian taking the trans-Alpine provinces, whilst Italy, Illyricum in part, and Africa were to be under the rule of Valentinian, or rather of his mother, Justina. Justina was an Arian, and the imperial court at Milan pitted itself against the Catholics, under the famous Ambrose, bishop of that city. But so great was his popularity that the court was decidedly worsted in the contest, and the emperor's authority materially shaken. In 387 Magnus Maximus (*q.v.*), who had commanded a Roman army in Britain, and had in 383 (the year of Gratian's death) made himself master of the northern provinces, crossed the Alps into the valley of the Po and threatened Milan. The emperor and his mother fled to Theodosius, the emperor of the East and husband of Galla, Valentinian's sister. Valentinian was restored in 388 by Theodosius, through whose influence he was converted to Orthodox Catholicism. Four years later he was murdered at Vienne in Gaul, probably at the instigation of his Frankish general Arbogast, with whom he had quarrelled.

See Gibbon, *Decline and Fall*, chap. 27; Schiller, *Geschichte der römischen Kaiserzeit*, bk. iii. vol. iv. pp. 32, 33; L. Ranke, *Weltgeschichte*, bk. iv. vol. i. chap. 6; and especially H. Richter, *Das weströmische Reich unter den Kaisern Gratian, Valentinian II. und Maximus* (Berlin, 1865), pp. 577–650, where full references to authorities are given.

VALENTINIAN III., emperor of the West from 425 to 455, the son of Constantius and Placidia, daughter of the great Theodosius. He was only six years of age when he received the title of Augustus, and during his minority the conduct of affairs was in the hands of his mother, who purposely neglected his education. His reign is marked by the dismemberment of the Western Empire; the conquest of the province of Africa by the Vandals in 439; the final abandonment of Britain in 446; the loss of great portions of Spain and Gaul, in which the barbarians had established themselves; and the ravaging of Sicily and of the western coasts of the Mediterranean by the fleets of Genseric. As a set-off against these calamities there was the great victory of Aëtius over Attila in 451 near Châlons, and his successful campaigns against the Visigoths in southern Gaul (426, 429, 436), and against various invaders on the Rhine and Danube (428–31). The burden of taxation became more and more intolerable as the power of Rome decreased, and the loyalty of her remaining provinces was seriously impaired in consequence. Ravenna was Valentinian's usual residence; but he fled to Rome on the approach of Attila, who, after ravaging the north of Italy, died in the following year (453). In 454 Aëtius, between whose son and a daughter of the emperor a marriage had been arranged, was treacherously murdered by Valentinian. Next year, however, the emperor himself was assassinated by two of the barbarian followers of Aëtius. He not merely lacked the ability to govern the empire in a time of crisis, but aggravated its dangers by his self-indulgence and vindictiveness.

Our chief original sources for the reign of Valentinian III. are Jordanes, Prosper's *Chronicles*, written in the 6th century, and the poet Apollinaris Sidonius. See also Gibbon, *Decline and Fall*, chaps. 33–35; J. B. Bury, *Later Roman Empire*, bk. ii. chaps. 6–8; E. A. Freeman, "Tyrants of Britain, Gaul and Spain" (*Eng. Hist. Review*, January 1886), and "Aëtius and Boniface" (*ibid.*, July 1887).

VALENTINOIS, the name of a countship in France, the chief town of which was Valence (Drôme). From the 12th to the 15th century Valentinois belonged to a family of Poitiers, which must not be confused with that of the counts of Poitiers. To the detriment of his kinsmen, the lords of St Vallier, Count Louis II. (d. 1419) bequeathed his counties of Valentinois and Diois to the Dauphin Charles, afterwards King Charles VII.; and in 1498 Louis XII. erected the countship of Valentinois into a duchy, and gave it to Caesar Borgia, son of Pope Alexander VI. A few years later Borgia was deprived of the duchy, which, in 1548, was given by Henry II. to his mistress, Diane de Poitiers, a descendant of the counts of Valentinois. Having again reverted to the Crown, the duchy was given by Louis XIII. to Honoré Grimaldi, prince of Monaco, whose descendants retained it until the French Revolution. The new duchy of Valentinois, however, did not consist of the lands attached to the former one, but was made up of several scattered lordships in Dauphiné. The title of duke of Valentinois is still borne by the prince of Monaco.

See J. Chevalier, *Mémoires pour servir à l'histoire des comtés de Valentinois et de Diois* (Paris, 1897–1906).

VALENTINUS, pope for thirty or forty days in 827, in succession to Eugenius II. (824–27). He was a Roman by birth, and, according to the *Liber Pontificalis*, was first made a deacon by Paschal I. (817–24). Nothing further is known of his history. His successor was Gregory IV. (827–44).

VALENTINUS and **THE VALENTINIANS.** I. Valentinus, the most prominent leader of the Gnostic movement, was born, according to Epiphanius (*Haer.* 31, 2), near the coast in Lower Egypt, and was brought up and educated in Alexandria. He then went to Rome, as we learn from Irenaeus, *Adv. haer.* iii. 4, 3; Valentinus came to Rome during the episcopate of Hyginus, flourished under Pius and stayed till the time of Anicetus. The duration of the episcopates of the Roman bishops at this period is not absolutely established, but we can hardly go altogether wrong if, with Harnack (*Chronologie der altchristlichen Literatur*, i. 291), we fix the period 135–60 for Valentinus's residence in Rome. This is confirmed by the fact that Justin Martyr in his *Apology*, i. 26, begun about 150, mentions that in his earlier work against heresy, the *Syntagma*, he attacked, among others, Valentinus; so that his heresy must have begun to appear at least as early as 140. According to Irenaeus iii. 3, 4, Polycarp, during his sojourn in Rome under the episcopate of Anicetus, converted a few adherents of the Valentinian sect. Tertullian (*Adv. Valentin.* cap. 4) declares that Valentinus came to Rome as an adherent of the orthodox Church, and was a candidate for the bishopric of Rome, but he abandoned the Church because a confessor was preferred to him for this office. The credibility of this statement may be questioned. There is nothing impossible in it, but it has rather the appearance of a piece of the usual church gossip. Great uncertainty attaches to the residence of Valentinus in Cyprus, recorded by Epiphanius (*loc. cit.*), who places it after his stay in Rome, adding that it was here that he definitely accomplished his secession from the Church. Scholars are divided as to whether this stay in Cyprus was before or after that in Rome. But on the whole it seems to be clear from the various notices that Valentinus did not, *e.g.* like Marcion, break with the Church from the very beginning, but endeavoured as long as possible to maintain his standing within it.

II. The authorities which we have to consider deal for the most part with Valentinianism in its fully developed form, and not with the original teaching of the master. Justin's *Syntagma* (*v.s.*), which treats of Valentinus, is unfortunately lost. Irenaeus in his section i. 11, 1–3, has preserved what is obviously an older document, possibly from Justin, dealing with Valentinus's own teaching and that of two of his disciples. The sketch which he gives is the best guide for the original form of Valentinianism. For Valentinus himself we have also to consider the fragments of his writings preserved by Clemens Alexandrinus. The best edition of and commentary on them is Hilgenfeld's *Ketzergeschichte des Urchristentums* (pp. 293–307). Irenaeus in his treatise *Adv. haer.* gives a detailed account of the two chief schools following Valentinus, the school of Ptolemaeus (i. 1–10), and Marcus and the Marcosians (i. 13–21). For his account of the Ptolemaeans, Irenaeus seems to have used various writings and expositions of the school, especially prominent being a collection of Scripture proofs which may have once had a separate literary existence (i. 1, 3; 3, 1–5 (6); 8, 2–4). To this work is appended in a somewhat disconnected fashion a commentary on the prologue to the fourth Gospel (i. 8, 5). Irenaeus himself twice prefaces his remarks by saying he is indebted to other authorities for his exposition (i. 2, 3–4; 7, 2–5). Section 6, 2–4, interrupts and disturbs the continuity, and section 5, 1–3, is a duplicate of 5, 4. We see how the account of Irenaeus is built up from small fragments. In his account of Marcus and the Marcosians the chapters on the sacraments (i. 13 and 20) seem originally to have formed part of the same whole. Very valuable too are the *Excerpta ex Theodoto* which are to be found in the works of Clemens Alexandrinus, and may be looked upon as a collection made by the author with a view to the eighth book of his *Stromateis*, which was never finished. Of these excerpts paragraphs 4, 5, 8–15, 17b–20, 27, should be distinguished as Clemens's own observations; the remaining parts are extracted from Gnostic writings (cf. Zahn, *Geschichte des Kanons*, ii. pp. 269 seq.). Yet the *Excerpta*, as their contents show, are not homogeneous, and cannot have been borrowed from one writing. The question as to whether Clemens' method of quotations, which mentions sometimes Theodotus, sometimes the Valentinians as his sources for these excerpts, is of any use as a guide to an estimate between these sources, must be left undecided. The most important sections are paragraphs 29–68, in which an attempt is made at a continuous exposition of the system (though here again from various sources), and section 69–86, which deals with the Gnostic doctrine of the sacraments and that of the liberation of the *Heimarmene*. The lost *Syntagma* of Hippolytus, which, as we know, is preserved in the works of Philastrius and the pseudo-Tertullian, seems to furnish us with valuable information as to the earlier doctrines of the sect, and in his second treatise against heretics, the so-called *Philosophumena* (6, 29 seq.). Hippolytus gives a homogeneous and continuous exposition of a later Valentinian system, possibly connected with the school of Ptolemaeus. Important, too, are Hippolytus' references to an Italic and an Anatolian branch of the Valentinian sect (6, 35). Tertullian gives at the beginning of his treatise against the Valentinians a few separate notices of the life and disciples of Valentinus, but his further argument is closely dependent upon Irenaeus' exposition of the Ptolemaean system, which he embellishes in his usual fashion with bitterly sarcastic comments. Epiphanius deals with Valentinus and his school in sections 31–36 of his work. In cap. 31, 1–8, he gives an account of the Valentinians, which seems to be based on his own observation. Thus in 31, 5–6, we find yet another verbal extract from a Valentinian doctrinal work. For the rest he copies the text of Irenaeus word for word, which has the advantage of preserving for us Irenaeus' Greek phraseology, which we otherwise should only know in a Latin translation. In his section on Ptolemaeus, cap. 33, Epiphanius has preserved for us a valuable letter of Ptolemaeus to Flora, which is a document of the highest importance for the understanding of Gnosticism.

III. Valentinus is the only one of the Gnostics who had a whole series of disciples who are known by name—indeed, in the accounts of the Church Fathers his own system and views are almost entirely obscured by the accounts of those of his disciples. His fundamental ideas can be with difficulty reconstructed from Irenaeus i. 11, from the fragments contained in Clemens, and to a certain extent from the *Syntagma* of Hippolytus, with the aid of later systems connected with his. Two early disciples of Valentinus are enumerated in Irenaeus ii. 2–3, one of whom is named Secundus; according to Irenaeus we have to trace back to him the division of the Valentinian Sophia into the double form of an aeon abiding in heaven, and her daughter, Sophia Achamoth. The second disciple is not named by Irenaeus; it is conjectured that he may have been Colorbases, the teacher of Marcus (i. 14, 1). The most important disciples of Valentinus, then, are the two dealt with at length by Irenaeus, Ptolemaeus and Marcus, who both seem to have had a numerous following. Besides these we should also mention Herakleon, of whose commentary on the gospel of St John extensive fragments are preserved by Origen. Ptolemaeus and Herakleon are counted by Hippolytus (6, 35) among the Italic branch of Valentinianism. There was also the Anatolian branch, as representative of which Hippolytus mentions Axionicus, who is also referred to by Tertullian as having actually been taught in Antioch. The *Excerpta ex Theodoto* in Clemens are also, according to the superscription, fragments from the Anatolian Gnosticism. It is, however, an error when Hippolytus speaks of Bardesanes as representative of this branch, for he had an entirely distinct position.

IV. In the important section of Irenaeus (i. 11) devoted to Valentinus, his teaching is definitely connected with the so-called "falsely reputed Gnostics." It will be useful, in trying to ascertain the teaching and view of life of Valentinus, to keep closely before us that of the "Gnostics" in the narrower sense of the word, as preserved in the expositions of Irenaeus (i. 29, 30) and Epiphanius (*passim*). The Gnostics were *par excellence* worshippers of the supreme Mother-goddess, the Μήτηρ, in whom we have no difficulty in recognizing the characteristics of the goddess of heaven of anterior Asia. This "Meter" is, in the system of these Gnostics, also at one time the stern, austere goddess, the Mother, who dwells in heaven, at other times the licentious goddess of love, the great courtesan (*Prunikon*), who, *e.g.* in the Simonian system, takes the form of the prostitute Helena, in whose worship all kinds of obscene rites were celebrated. She dwells in the eighth or highest heaven, whence her name Ogdoas. Next to her stands the supreme and shadowy form of the unknown and nameless Father; below her in the seven lower heavens reign the seven planetary, world-creating angelic powers, headed by Jaldabaoth, who was later to be identified with the God of the Old Testament. The Gnostics are children of the supreme Mother; from her the heavenly seed, the divine spark, descended in some way to this lower world, and thus the children of heaven still exist in this gross material world, subject to the Heimarmene and in the power of hostile spirits and powers; and all their sacraments and mysteries, their formulae and symbols, must be part of her worship, in order to find the way upwards, back to the highest heaven, "where the Mother dwells." This idea that the Gnostics know themselves to be in a hostile and evil world reacted in the same direction upon the conception of the Mother of heaven. She became likewise a fallen goddess, who has sunk down into the material world and seeks to free herself from it, receiving her liberation at the hands of a heavenly Redeemer, exactly like the Gnostics. Various myths have contributed towards this; one of these is the widespread naïve pagan myth of a goddess who disappears, carried off by the powers of evil, to be set free and taken back to her home by a divine liberator, a brother or betrothed. The moon-goddess with her disappearance may have been the prototype of this mythical figure (there are, indeed, certain analogies to be remarked between the Simonian Helena and Selene). With this myth are connected certain Jewish Theologumena; the goddess who sinks down into the material may readily be identified with Ruach (Rucha), the Spirit of God, who broods over Chaos, or even with the later Sophia (Chokma Achamoth), who was generally conceived of as a world-creating agent. Thirdly, the chief influence at work here seems to have been the oriental myth of the Primal Man sunk in the material world, which appears in its simple form in individual Gnostic systems, *e.g.* in Poimandres (in the *Corpus hermeticum*) and in Manichaeism. In the Gnostic systems of Irenaeus i. 29, 30, the Anthropos (*i.e.* the Primal Man) no longer appears as the world-creative power sinking down into the material world, but as a celestial aeon of the upper world (or even as the supreme god), who stands in a clearly defined relationship to the fallen goddess; it is possible that the rôle of the Anthropos is here transferred to Sophia Achamoth. The fallen Sophia next becomes, in like manner, a world creative power. And now the highest of the world-creating angels, Jaldabaoth, appears as her son, and with this whole conception are then linked up the ideas of liberation and redemption. Next to the Sophia stands a male redeeming divinity. In all the Gnostic systems known to us Christ already appears as the Saviour, and so in this respect a Christianizing of Gnosticism has been carried out; but originally this Saviour-divinity had nothing in common with the figure of the Christian Redeemer. This is clear from Irenaeus's account of the Gnostics (i. 30). For here the redemption is actually and essentially effected through the uniting in marriage of the fallen goddess with her higher celestial brother, and they are expressly described as the bride and bridegroom. That is to say, we have here the purely mythical idea of the deliverance of a goddess by a god, and of the celestial marriage of a divine pair. This myth can only with difficulty be connected with the historic redemption through Jesus of Nazareth, by further relating that Christ, having been united to the Sophia, descends into the earthly Jesus.

V. This primitive "Gnosticism" was very closely followed by Valentinus, who may have come to know these doctrines in Egypt. This can be seen from the fact that in Valentinianism the Mother-goddess always stands absolutely at the centre of the system. Irenaeus (i. 6, 1) is very instructive on this point, characterizing the Gnostics as the *pneumatici* who have a perfect knowledge of God, and have been initiated into the mysteries of Achamoth. A mighty system is certainly erected here out of the modest elements of Gnosticism.

(1) More especially, the superstructure of the celestial system, the celestial world of aeons, which exists above the fallen goddess, is

here developed in the most complicated way. Valentinus has a system of thirty aeons, but we can with but little trouble recognize the simple system underlying this great superstructure. The quite shadowy plurality of ten and twelve aeons (the Dekas and the Dodekas) of the Valentinian system we may at once set aside as mere fantastical accretions. We have left only a group of eight celestial beings, the so-called Ogdoas, and of these eight figures four again are peculiar to the Valentinian system, and are probably artificial interpolations. For instance, when for the third pair of aeons we find the Logos and Zoë, figures which occur only here, and perceive, moreover, that the place of this pair of aeons is not firmly established, but that in this Valentinian tradition they occur sometimes before and sometimes after the fourth pair of aeons, the Anthropos and the Ekklesia, we cannot be far wrong in suspecting that here already we find Valentinus to have been influenced by the prologue of the fourth Gospel (we also find the probably Johannine names Monogenes and Parakletos in the series of aeons).

(2) The first pair of aeons, Bythos and Sige, is likewise an original innovation of the Valentinian school, and clearly betrays a monistic tendency. According to Irenaeus's account of the "Gnostics" (i. 29), their theory was that Sophia casts herself into the primal substratum of matter to be found outside the celestial world of aeons. In the Valentinian system, primal matter (Bythos), the original Chaos, is brought into connexion with the celestial world of aeons. And thus it is effected that matter is here not found originally and irretrievably separated from the higher celestial world, but that the latter originally exists for itself alone; the fall or disturbance is accomplished within the celestial world, and the material world first comes into existence through the fall. When we subtract from the Ogdoas the two pairs of aeons whose later introduction into the Valentinian system has been demonstrated, we are left actually with a double pair of aeons, the Father and Truth, the Anthropos and the Ekklesia. These strongly recall the Gnostic systems set forth in Irenaeus i. 29 and 30 (cf. i. 29, 3). And thus the *Anthropos* (man), a leading figure of primitive Gnosticism, now half-forgotten, moves back into the centre of the system and the direct vicinity of the fallen goddess. It is also clear why the Ekklesia appears together with the Anthropos. With the celestial Primal Man—of whom the myth originally relates that he has sunk into matter and then raised himself up from it again—is associated the community of the faithful and the redeemed, who are to share the same fate with him. Similarly among the Gnostics of Irenaeus i. 29, 3, perfect Gnosis (and thus the whole body of Gnostics) is connected with the Anthropos.

(3) The fallen goddess, mentioned above, occurs in the Valentinian system, as in the Gnostic systems described by Irenaeus, and in the older systems it is again the celestial aeon himself who falls, and whose fate outside the Pleroma is related (cf. the exposition in Irenaeus i. 11, *Excerpta ex Theodoto*, § 31 seq., and Hippolytus, *Syntagma*, in the pseudo-Tertullian). In the later Valentinian systems, probably from Secundus onwards (see above), the figure appears in double guise. The higher Sophia still remains within the upper world after creating a disturbance, and after her expiation and repentance; but her premature offspring, Sophia Achamoth, is removed from the Pleroma, and becomes the heroine of the rest of the drama (we have dealt in the preceding section with the other conception of the fall of Sophia).

(4) In the true Valentinian system the so-called Christos is the son of the fallen Aeon, who is thus conceived as an individual. Sophia, who in a frenzy of love had sought to draw near to the unattainable Bythos, brings forth, through her longing for that higher being, an aeon who is higher and purer than herself, and at once rises into the celestial worlds. Among the Gnostics of Irenaeus we find a kindred conception, but with a slight difference. Here Christos and Sophia appear as brother and sister, Christos representing the higher and Sophia the lower element. In the enigmatic figure of Christos we again find hidden the original conception of the Primal Man, who sinks down into matter but rises again. (In the later Valentinian systems this origin of the Christos is entirely obscured, and Christ, together with the Holy Spirit, becomes a later offspring of the celestial world of aeons; this may be looked upon as an approximation to the Christian dogma).

(5) A figure entirely peculiar to Valentinian Gnosticism is that of Horos (the Limiter). The name is perhaps an echo of the Egyptian Horus. The peculiar task of Horos is to separate the fallen aeons from the upper world of aeons. At the same time he becomes (first, perhaps, in the later Valentinian systems) a kind of world-creative power, who in this capacity helps to construct an ordered world out of Sophia and her passions. He is also called, curiously enough, Stauros (cross), and we frequently meet with references to the figure of Stauros. But we must not be in too great a hurry to conjecture that this is a Christian figure. Speculations about the Stauros are older than Christianity, and a Platonic conception may have been at work here. Plato had already stated that the world-soul revealed itself in the form of the letter Chi (X); by which he meant that figure described in the heavens by the intersecting orbits of the sun and the planetary ecliptic. Since through this double orbit all the movements of the heavenly powers are determined, so all "becoming" and all life depend on it, and thus we can understand the statement that the world-soul appears in the form of an X, or a cross. The cross can also stand for the wondrous aeon on whom depends the ordering and life of the world, and thus Horos-Stauros appears here as the first redeemer of Sophia from her passions, and as the orderer of the creation of the world which now begins. This explanation of Horos, moreover, is not a mere conjecture, but one branch of the Valentinian school, the Marcosians, have expressly so explained this figure (Irenaeus i. 17, 1). Naturally, then, the figure of Horos-Stauros was often in later days assimilated to that of the Christian Redeemer.

(6) Peculiarly Valentinian is the above-mentioned derivation of the material world from the passions of Sophia. Whether this already formed part of the original system of Valentinus is, indeed, questionable, but at any rate it plays a prominent part in the Valentinian school, and consequently appears with the most diverse variations in the account given by Irenaeus. By it is effected the comparative monism of the Valentinian system. The dualism of the conception of two separate worlds of light and darkness is overcome by the derivation of the material world from the passions of Sophia. Older myths may here have served as a model; for instance, we may recall the myth of the derivation of the world from the body and limbs of the Primal Man (Bousset, *Hauptprobleme der Gnosis*, p. 211).

(7) This derivation of the material world from the passions of the fallen Sophia is next affected by an older theory, which probably occupied an important place in the true Valentinian system. According to this theory the son of Sophia, whom she forms on the model of the Christos who has disappeared in the Pleroma, becomes the Demiourgos, and this Demiourgos with his angels now appears as the real world-creative power. These two conceptions had now to be combined at all costs. And it is interesting to observe here what efforts were made to give the Demiourgos a better position. According to the older conception, he was an imperfect, ignorant, half-evil and malicious offspring of his mother, who has already been deprived of any particle of light (Irenaeus i. 29, 30). In the Valentinian systems he appears as the fruit of Sophia's repentance and conversion. Even his name has been changed from that of the older Gnosticism. He is no longer called Jaldabaoth, but has been assigned the better name, drawn from the philosophy of Plato, of Demiourgos. We must not forget here that the Demiourgos of the Gnostic is known to have corresponded to the God of the Old Testament, who was the God of the Christian Church, and that we can thus lay our finger here on a compromise with the faith of the great Christian community.

(8) With the doctrine of the creation of the world is connected the subject of the creation of man. We fortunately know, from a fragment preserved by Clemens, that Valentinus here preserved the old Gnostic myth practically unaltered in his system. According to it, the world-creating angels—not one, but many—create man, but the seed of the spirit comes into their creature without their knowledge, by the agency of a higher celestial aeon, and they are then terrified by the faculty of speech by which their creature rises above them, and try to destroy him. In the Valentinian system known to us this myth has practically lost its original freshness and colour, and can only be arrived at from allusions. On the other hand, the speculations of the Valentinians delight in accounts of the artificial and complicated putting together of the first man out of the various elements. And a specifically Valentinian idea is here added in that of the threefold nature of man, who is represented as at once spiritual, psychical and material. In accordance with this there also arise three classes of men, the *pneumatici*, the *psychici* and the *hylici* (ὕλη, matter). It is significant that Valentinus himself is credited with having written a treatise upon the three natures (Schwartz, *Aporien*, i. 292). Here we have another instance of the theological compromise of the Valentinians. All the other Gnostic systems recognize only a dual division, the children of light and the children of darkness. That the Valentinians should have placed the *psychici* between the *pneumatici* and *hylici* signifies a certain recognition of the Christian Church and its adherents. They are not numbered simply among the outcasts, but considered as an intermediate class, to whom is left the choice between the higher celestial nature and the lower and earthly.

(9) At the centre of the whole Valentinian system naturally stands the idea of redemption, and so we find here developed particularly clearly the myth of the heavenly marriage already known from Irenaeus i. 30 to be Gnostic. Redemption is essentially accomplished through the union of the heavenly Soter with the fallen goddess. There is great uncertainty in the Valentinian system as to who this celestial Soter is. In the Gnostic systems of Irenaeus i. 30 he is the Christos, the celestial brother who turns back to the fallen sister. In the Valentinian system the redeemer is likewise sometimes brought into relation with the Christos, sometimes, in a significant way, with the Anthropos, and sometimes again with Horos-Stauros. In the fully developed Ptolemaean system he appears as the common offspring of the whole Pleroma, upon whom all the aeons confer their best and most wonderful qualities (we may compare here the Marduk myth, in which it is related that all the gods transfer their qualities and powers to the young god Marduk, who is recognized as their leader). And this celestial redeemer-aeon now enters into a marriage with the fallen goddess; they are the "bride and bridegroom." It is boldly stated in the exposition in Hippolytus's *Philosophumena* that

they produce between them 70 celestial sons (angels). (In the other accounts these angels no longer appear as the sons of the celestial pair, but as the heavenly attendants accompanied by whom the Soter approaches Sophia.) It is obvious from the number 70 that we have here a marriage between a celestial and divine pair. This marriage relation between the Soter and Sophia is expounded in quite a material way even in Irenaeus iii. 3, 4, where the Old Testament phrase πᾶν ἄρρεν διανοῖγον μήτραν is translated, "the Pan (the all, a name for the Soter), the masculinity which opens the mother's womb." This myth of the redeemer, as we shall see more fully below, and as may be mentioned here, is of great significance for the practical piety of the Valentinian Gnostics. It is the chief idea of their pious practices mystically to repeat the experience of this celestial union of the Soter with Sophia. In this respect, consequently, the myth underwent yet wider development. Just as the Soter is the bridegroom of Sophia, so the heavenly angels, who sometimes appear as the sons of the Soter and Sophia, sometimes as the escort of the Soter, are the males betrothed to the souls of the Gnostics, which are looked upon as feminine. Thus every Gnostic had his angel standing in the presence of God, and the object of a pious life was to bring about and experience this inner union with the celestial abstract personage. This leads us straight to the sacramental ideas of this branch of Gnosticism (see below). And it also explains the expression used of the Gnostics in Irenaeus i. 6, 4, that they always meditate upon the secret of the heavenly union (the Syzygia).

(10) With this celestial Soter of the Valentinians and the redemption of Sophia through him is connected, in a way which is now not quite intelligible to us, the figure of Jesus of Nazareth and the historical redemption connected with his name. The Soter, the bridegroom of Sophia, and the earthly Jesus answer to each other as in some way identical. Here again we recognize the entirely artificial compromise between Gnosticism and Christianity. It is characteristic of this that in one passage in the account of Irenaeus it is directly stated that the redeemer came specially on account of the *psychici*, for the *pneumatici* (the Gnostics) already belong by nature to the celestial world, and no longer require any historical redemption, while the *hylici* have fallen beforehand into damnation, so that with the *psychici* only is there any question as to whether they will turn to redemption or damnation, and for them the historical redeemer is of efficacy (Irenaeus i. 6, 1). This assertion is in thorough agreement with the fundamental tendency of Gnostic piety; for the Gnostics individual redemption has actually been accomplished in the union between the Soter and Sophia, and is effected for the individual Gnostics in repeating the experience of this union. So that in effect they no longer require the historical redemption through Jesus.

(11) Among the manifold confusion of opinions as to the nature and characteristics of the Redeemer Jesus of Nazareth, certain explanations stand out as characteristically Valentinian, especially those in which it is laid down that even the redeemer has a threefold nature; from his mother, Sophia, he derived his nature as a *pneumaticos*, in the world of the Demiourgos he was united with the Christos, and finally a wonderful bodily nature was formed for him from celestial elements, which was yet not of earthly material. As such he was miraculously born of the Virgin, as through a canal (διὰ σωλῆνος). The compromises with the Catholic Church are here obvious. According to this theory Jesus, having an element of the psychical nature, can appear in virtue of this as the son of the Demiourgos, *i.e.* of the Old Testament God, and as the Redeemer of the *psychici*; and when we read of this miraculous bodily nature, which is not composed of earthly material, there is an obvious compromise between the fundamental heresy of Gnosticism, Docetism and the dogma of the Christian Church as to the true bodily nature of the Redeemer. Into this already complicated Christology is now introduced by an obscure combination, in the systems known to us, the idea that upon this Jesus, so constituted, yet another celestial nature, the Christos or the Soter, has descended at his baptism. This is the older and peculiar Gnostic conception of Irenaeus i. 30, which appears to have been introduced into Valentinianism at a late stage of its development. The express statement in Hippolytus 6, 35, that this doctrine was shared only by the Italic branch of the Valentinians, but disclaimed by the Anatolian branch, also bears on the point.

(12) The close of the drama and the final accomplishment of the redemption is also depicted by the Valentinian writings in accordance with the old Gnosticism. A general ascent takes place, the Soter returns with the liberated Sophia into the Pleroma, and likewise the Gnostics with the angels with whom they are connected. But it is characteristic of the Valentinian system that the Demiourgos and the *psychici* who are connected with him also ascend to the eighth or highest heaven of Achamoth, while the remaining material world sinks into flames.

VI. The first survey of these confused speculations, these myths gathered together and preserved from the ancient world, this marshalling together of the most varied traditions, and above all, these artificial attempts at compromise dictated by practical prudence, makes us inclined to doubt whether it was possible for any true piety to coexist with all this. Yet such piety existed, indeed we have here a set of regular mystics. It is not, indeed, a purely spiritual and mystical piety, but a mysticism much distorted and over-grown with sacramental additions and a mysterious cult. But all this is not without an inner value and an attractive atmosphere. Our information, it is true, is scant; most of it is to be found in the fragments of the letters and homilies of the master of the school preserved for us by Clemens. The central point of the piety of Valentinus seems to have been the mystical contemplation of God; in a letter preserved in Clemens ii. 20, 114, he sets forth that the soul of man is like an inn, which is inhabited by many evil spirits. "But when the Father, who alone is good, looks down and around him, then the soul is hallowed and lies in full light, and so he who has such a heart as this is to be called happy, for he shall behold God." But this contemplation of God, as Valentinus, closely and deliberately following the doctrines of the Church, and with him the compiler of the Gospel of John declares, is accomplished through the revelation of the Son. This mystic and visionary also discusses the Psalm which is preserved in the *Philosophumena* of Hippolytus (6, 37). With celestial enthusiasm Valentinus here surveys and depicts the heavenly world of aeons, and its connexion with the lower world.[1] Exalted joy of battle and a valiant courage breathe forth in the sermon in which Valentinus addresses the faithful (Clemens iv. 13, 91): "Ye are from the beginning immortal and children of eternal life, and desire to divide death amongst you like a prey, in order to destroy it and utterly to annihilate it, that thus death may die in you and through you, for if ye dissolve the world, and are not yourselves dissolved, then are ye lords over creation and over all that passes away." From Tertullian, *de carne Christi* cap. 17, 20, we learn that Valentinus composed psalms. We may conjecture that these psalms were similar in their kind to the beautiful odes of Solomon which have lately been discovered, though without suggesting that these particular psalms were specifically Gnostic or Valentinian.

VII. But with this mysticism, of which we possess only a few of the beautiful flowers, is connected the mystery and cult of the sacrament. The lofty spirituality of the Gnostic degenerates over and over again into a distinctly material and sensual attitude, in which all kinds of efforts are made actually to assimilate to oneself the divine through external means. Our authorities for the sacramental practices of the Valentinians are preserved especially in the accounts of the Marcosians given in Irenaeus i. 13 and 20, and in the last section of the *Excerpta ex Theodoto*. We must point out once again how the mother aeon stands absolutely at the centre of this cult. There are moreover various figures in the fully developed system of the Valentinians who are in the Gnostic's mind when he calls upon the Mother goddess; sometimes it is the fallen Achamoth, sometimes the higher Sophia abiding in the celestial world, sometimes Aletheia, the consort of the supreme heavenly father, but it is always the same person, the Mother goddess, on whom the fervent faith of the Gnostics is fixed. Thus a baptismal confession of faith of the Gnostics (Irenaeus i. 21, 3) runs, "In the name of the unknown Father of all, by Aletheia, the mother of all, by the name which descended upon Jesus." And in almost all the sacramental prayers of the Gnostics handed down to us by Irenaeus, the mother is the object of the invocation. If the interpretation generally given of the Aramaean baptismal formula by Irenaeus in the same passage is correct, it began with the words: "In the name of Achamoth." Hence we can understand how, according to Irenaeus i. 5, 3, Sophia Achamoth had among the Valentinians the title of *kyrios* (lord), and, a question closely connected with this, why they did not call Jesus *kyrios*, but Soter, as Irenaeus expressly assures us (i. 1, 3). *Kyrios* is the title given to the hero who is the subject of a cult among a given body of people, and the heroine of the cult of the Valentinians, Sophia Achamoth, therefore receives this title.

[1] Cf. Goethe's *Faust*, I.:—
"Wie Himmelskräfte auf und niedersteigen
Und sich die goldnen Eimer reichen."

The chief sacrament of the Valentinians seems to have been that of the bridal chamber.

We have stated above the relation of this sacrament with the Valentinian speculations. Just as the apostle Paul represented his Christianity as a living, dying and rising again with Christ, so the first concern of the pious Valentinian was the experience of the divine marriage feast of Sophia. As Sophia was united with the Soter, her bridegroom, so the faithful would experience a union with their angel in heaven (*i.e.* their "double," *Doppelgänger*). The ritual of this sacrament is briefly indicated by Irenaeus i. 21, 3: "A few of them prepare a bridal chamber and in it go through a form of consecration, employing certain fixed formulae, which are repeated over the person to be initiated, and stating that a spiritual marriage is to be performed after the pattern of the higher Syzygia." Through a fortunate chance, a liturgical formula which was used at this sacrament appears to be preserved, though in a garbled form and in an entirely different connexion, the author seeming to have been uncertain as to its original meaning. It runs: "I will confer my favour upon thee, for the father of all sees thine angel ever before his face . . . we must now become as one; receive now this grace from me and through me; deck thyself as a bride who awaits her bridegroom, that thou mayest become as I am, and I as thou art. Let the seed of light descend into thy bridal chamber; receive the bridegroom and give place to him, and open thine arms to embrace him. Behold, grace has descended upon thee."

Besides this the Gnostics already practised baptism, using the same form in all essentials as that of the Christian Church. The name given to baptism, at least among certain bodies, was *apolytrosis* (liberation); the baptismal formulae have been mentioned above. Great importance attaches in the Gnostic sacramental speculations to invocation (of the name). The Gnostics are baptized in the mysterious name which also descended upon Jesus at his baptism. The angels of the Gnostics have also had to be baptized in this name, in order to bring about redemption for themselves and the souls belonging to them (*excerpta ex Theodoto*, 22). In this connexion we also find the formula λύτρωσιν ἀγγελικήν (for the angelic redemption, Irenaeus i. 21, 3). In the baptismal formulae the sacred name of the Redeemer is mentioned over and over again. In one of the formulae occur the words: "I would enjoy thy name, Saviour of Truth." The concluding formula of the baptismal ceremony is: "Peace over all upon whom the Name rests" (Irenaeus i. 21, 3). This name pronounced at baptism over the faithful has above all the significance that the name will protect the soul in its ascent through the heavens, conduct it safely through all hostile powers to the lower heavens, and procure it access to Horos, who frightens back the lower souls by his magic word (*exc. ex Theodoto*, 22). And for this life also baptism, in consequence of the pronouncing of the protecting name over the baptized person, accomplishes his liberation from the lower daemonic powers. Before baptism the Heirmarmene is supreme, but after baptism the soul is free from her (*exc. ex Theod.* 77).

With baptism was also connected the anointing with oil, and hence we can also understand the death sacrament occurring among the Valentinians consisting in an anointing with a mixture of oil and water (Irenaeus i. 21, 4). This death sacrament has naturally the express object of assuring the soul the way to the highest heaven "so that the soul may be intangible and invisible to the higher mights and powers" (Irenaeus, *loc. cit.*). In this connexion we also find a few formulae which are entrusted to the faithful, so that their souls may pronounce them on their journey upwards. One of these formulae runs: "I am a son of the Father, the Father who was before the whole world—I came to see everything, that which is strange and that which is my own; and deep down there is nothing strange, but only that which belongs to Achamoth. For she is the feminine aeon, and she has made all things. I draw my sex from that which was before the world, and take back to it the property from which I came" (Irenaeus i. 21, 5). Another formula is appended, in which there is a distinction in the invocation between the higher and lower Sophia. Another prayer of the same style is to be found in Irenaeus i. 13, and it is expressly stated that after prayer is pronounced the Mother throws the Homeric helmet (cf. the *Tarnkappe*) over the faithful soul, and so makes him invisible to the mights and powers which surround and attack him.

On the other hand, we see how here and there a reaction took place against the absurdity of this sacramental superstition. Thus Irenaeus (i. 21, 4) tells us of certain Gnostics who would admit no external holy practices as efficacious: "The completed *apolytrosis* is the actual knowledge of the inexpressible majesty (of God), for through ignorance arose all faultiness and suffering, and through knowledge will be removed all the conditions which arose from ignorance; and therefore knowledge (*gnosis*) is the perfecting of the inner man." A pure piety, rising above mere sacramentalism, breathes in the words of the Gnostics preserved in *excerpta ex Theodoto*, 78, 2: "But not baptism alone sets us free, but knowledge (*gnosis*): who we were, what we have become, where we were, whither we have sunk, whither we hasten, whence we are redeemed, what is birth and what rebirth."

VIII. It has already been seen clearly that Valentinian Gnosticism affected the nearest approach of all the Gnostic sects to the Catholic Church. Valentinus's own life indicates that he for a long time sought to remain within the official Church, and had at first no idea of founding a community of his own. Many compromises in his theories point the same way. The Johannine tendencies of his doctrine of the aeons (Logos, Zoë, Aletheia, Parakletos); the attempt to modify the sharp dualism of Gnosticism in a monistic direction; the derivation of the world from the fallen Sophia; the favourable judgment of the Demiourgos, and his origin in the repentance and conversion of Sophia, which are peculiar to the Valentinian system; the triple division of mankind into *pneumatici*, *psychici* and *hylici*, which is obviously contrived for the benefit of the *psychici*; the inclusion of an element of the *psychici* in the composition of the Redeemer; the theory that Jesus possessed a miraculous body formed in the upper world; the emphasis on the fact that the redemption of Jesus was primarily for the *psychici*; the doctrine that by the final redemption the Demiourgos and the *psychici* find a place in the Ogdoas; the adoption of Christian baptism—all this, and perhaps more, indicates a definite and deliberate approach towards the doctrine of the Church.

These Gnostics, as in the case of most of the other Gnostic sects, possessed their own peculiar holy writings and books, but they also made a great use in their own circle of the canon of the Christian Church, especially the canon of the New Testament and—though with a few reservations—of the Old Testament. Irenaeus in his account of the Ptolemaean sects has used a source which contained a detailed scriptural exposition of the Valentinian doctrines based on the New Testament. We can even—and this is of great interest and significance for the history of the canon—establish the contents of the Gnostic canon. It included the three first gospels and the apostle Paul. The proofs are constantly drawn firstly from the utterances of the Saviour, and then from the Epistles of Paul. The Gospel of John does not seem to have yet found a place in this canon, for the very good reason that it was not yet widely known and circulated. Later Valentinian Gnosticism delighted in making use of the Johannine Gospel as a crowning testimony. Thus to the older and ancient scriptural evidences which we mentioned above, Irenaeus (i. 8, 5) directly appends a commentary on the Gospel of John, which is ascribed to Ptolemaeus himself. And in the *excerpta ex Theodoto*, 6 seq., we also find a commentary on the prologue to this Gospel. And we know that the later Valentinian Herakleon wrote a detailed exposition of the whole Gospel. But the Old Testament too was a sacred book of these Gnostics, and its statements were used as evidence and proofs. This was done with some diffidence and caution. The attitude, at least of the later Valentinians, is best indicated by the letter of Ptolemaeus to Flora, which is preserved in Epiphanius 33, 3–7. Ptolemaeus here openly attacks the doctrine that the Old Testament is the work of the devil, or that it cannot at least be ascribed unconditionally to the Supreme God. The Old Testament he considers to contain a system of laws given by God himself, a system of laws given by Moses according to his own ideas, and precepts interpolated by the elders of the people. The laws of God himself fall then into three classes: the true law, which is not interwoven with evil; the law permeated with unrighteousness, which the Redeemer has dissolved; and the typical and symbolical law, which the Redeemer has translated from the material into the spiritual. Thus there is a gradual approach to the Christian Church's conception of the Old Testament. (It should indeed be remarked that Ptolemaeus in the above-mentioned letter has purposely expounded the exoteric doctrine in special approximation with the Catholic Church, while for the actual difficult questions as to the nature of the Demiourgos and his relation with the unity of the Divine nature he consoles Flora with a further and more intimate instruction.)

And yet this reconciliation of Gnosticism was a fruitless and henceforward a purposeless undertaking. Oriental dualism and wildly intemperate Oriental mythology had grown into so radical and essential a part of Gnosticism that they could not be separated from it to make way for a purer and more spiritual view of religion. And at a time when the prevailing tendency of Christianity was a struggle out of the darkness of Oriental mythology and eschatology into clearness, and an effort towards union with the lucid simplicity of the Hellenic spirit, these Gnostics, for all their efforts, and even the most noble of them, had come too late. They are not the men of a forward movement, but they are, and remain, in spite of all clearer insight, the rear-guard in the history of piety, who have gone under and disappeared in a struggle with the impossible. None the less we cannot omit the observation that the Christian Church in later centuries to a certain extent travelled again over Gnostic ground in its sacramental theories and fully developed Christological speculations.

VALENZUELA, FERNANDO DE (1630–1692), Spanish royal favourite and minister, was born at Naples on the 19th of January 1630. His father, Don Francisco de Valenzuela, a gentleman of Ronda, had been compelled to flee from Spain in consequence of a brawl, and had enlisted as a soldier in Naples, where he married Doña Leonora de Encisa. Francisco de Valenzuela having died young, his son was placed by his mother as a page in the household of the duke of Infantado. He lost his place owing to a reduction of the duke's establishment, and for several years he lived obscurely; but by good fortune he succeeded in persuading Maria de Uceda, one of the ladies-in-waiting of Mariana, second wife of Philip IV., to marry him. By her help Valenzuela obtained a footing in the palace. He was appointed introducer of ambassadors on the 12th of October 1671, and it became notorious that whoever had a petition to present or a place to ask for must apply to him. He became popularly known as the *duende*, the fairy or brownie of the palace, and was believed to be the lover of the queen. In 1675 a court intrigue, conducted by his rivals and supported by the younger Don John of Austria, was so far successful that he was driven from court; but the queen gave him the title of marquis of Villa Sierra, and appointed him ambassador to Venice. Valenzuela succeeded in getting the embassy exchanged for the governorship of Granada. His stay at this post was short, for he was able to organize a counter-intrigue which soon brought him back to court. The queen-regent now openly appointed him prime minister, gave him official quarters in the palace, and conferred a grandeeship on him, to the profound indignation of the other grandees. In January 1678 a palace revolution broke out against the queen-regent, who was driven from Madrid, and Valenzuela fled for refuge to the monastery of the Escorial. He was, however, taken out by force, and his house was pillaged. His property was confiscated—his jewels, furniture and ready money were estimated to amount to £120,000—he was degraded from the grandeeship and exiled to the Philippines. At a later period he was released from close confinement and allowed to settle in Mexico, where a pension was given him. He died in Mexico, from the kick of a horse he was breaking in, on the 7th of February 1692. Part of his property, and the title of Villa Sierra, but not the grandeeship, were restored to his wife and children. The career of Valenzuela probably helped to suggest the subject of *Ruy Blas* to Victor Hugo.

See *Documentos Inéditos para la Historia de España*, vol. lxvii. (Madrid, 1842, &c.), which contain an artful and well-written defence of himself addressed to King Charles II. of Spain from Mexico.

VALERA Y ALCALÁ GALIANO, JUAN (1824–1905), Spanish novelist, son of a retired commodore, José Valera, who married Doña Dolores Alcalá Galiano, marquesa de la Paniega, widow of a Swiss general named Freuller, was born on the 18th of October 1824 at Cabra (Cordova). Valera was educated at Malaga and at the university of Granada, where he took a degree in law. Entering diplomacy in 1847, he became unpaid attaché to the Spanish embassy at Naples under the famous Duke de Rivas, the leader of the romantic movement in Spain. Valera witnessed the events of the Revolution, was promoted second secretary to the embassy at Lisbon in 1850, and in 1851 was transferred as first secretary to Rio de Janeiro, where he remained for two years. After a short period passed at Dresden, he was appointed to the permanent staff of the Foreign Office at Madrid, and in 1857 was attached to the special embassy to St Petersburg under the Duke de Osuna. In 1858 he resigned his post, was elected deputy for Archidona, in the province of Malaga, took his seat with the advanced Liberal Opposition, and joined with Albareda and Fabié in founding *El Contemporáneo*, a very influential journal. An expert in the art of covering an opponent with polite ridicule, his writings in the press attracted general attention. He was elected a member of the Spanish Academy in 1861, and remained in Opposition till 1865, when O'Donnell appointed him minister at Frankfort; on the flight of Isabella II. in 1868 he was elected deputy for Montilla in the province of Cordova, became under-secretary of state for foreign affairs, and was one of the deputation who offered the crown to Amadeus of Savoy in the Pitti Palace at Florence. Though he always called himself a Moderate Liberal, Valera invariably voted for what are considered Radical measures in Spain, and a speech delivered by him in February 1863 against the temporal power of the pope created a profound sensation. However, though a member of the revolutionary party, he steadily opposed organic constitutional changes, and therefore he retired from public life during the period of republican government. After the Bourbon restoration he acted as minister at Lisbon (1881–1883), at Washington (1885), at Brussels (1886) and as ambassador at Vienna (1893–1895), retiring from the diplomatic service on the 5th of March 1896. During the last ten years of his life he took no active part in politics. He died on the 18th of April 1905.

Valera's first publication, *Canciones, Romances y Poemas*, was published in 1856. His verses are melodious, finished and various in subject; but they are rather the imitative exercises of a scholarly man of the world than the inspirations of an original poet. That they failed to attract notice is not altogether to be regretted, for, as Valera himself confessed later in his half-ironical, half-ingenuous preface to the second edition (1885), "In spite of my idleness, I should have shown a most deplorable fecundity had I been received with favour and applause." However, if he published little more in the shape of verse, he wrote incessantly in prose. More than two-thirds of his work is still uncollected, buried in reviews and newspapers; but we may take it that he rescued what he thought most valuable. His criticism may be read in the *Estudios críticos sobre literatura* (1864), in the *Disertaciones y juicios literarios* (1878) and in the *Nuevos estudios críticos* (1888); yet, with all his penetration and taste, Valera laboured under one disadvantage not frequent in critics. He suffered from an excessive amiability. He said a hundred incisive, wise, witty, subtle and suggestive things concerning the mysticism of St Theresa, the art of novel-writing, *Faust*, the Inquisition, *Don Quixote*, Shakespeare, the psychology of love in literature; but, to do himself justice, it was an almost indispensable condition that he should deal with the past. In the presence of a living author Valera was disarmed. Unless the writer were an incurable pessimist, Valera would find something in his work to praise, exhausting the vocabulary of compliment and graceful tribute; but, except in the *Cartas americanas* (1889), where the laudation was manifestly so exaggerated that no harm could come of it, this trick of eulogy became perplexing and misleading. Valera, in effect, refused to criticize contemporary literature; as a rival author it seemed to him an indelicacy to censure his competitors, and he was either laudatory or silent. It is regrettable, for criticism was and is greatly needed in Spain.

Valera, then, excelled neither as a poet nor as an impartial critic; he had the vocation of the novelist, though he was slow in discovering it, since he was in his fiftieth year before he published the novel which was to make him famous. *Pepita*

Jiménez (1874) is a recital of the fall of Luis de Vargas, a seminarist who conceived himself to be a mystic and a potential saint, and whose aspirations dissolve at the first contact with reality. It is easy to point out blemishes: the story is not well constructed, and it has pauses during which the writer's fantasy plays at pleasure over a hundred subjects not very germane to the matter; but its characters are as real as any in fiction, the love story is told with the most refined subtlety and malicious truth, while page upon page is written in such Spanish as would do credit to the best writers of the 16th and 17th centuries. Unquestionably *Pepita Jiménez* is a very remarkable achievement—so remarkable, that contemporaries were reluctant to admit the superiority of its successors. It is certain that Valera's second novel, *Las ilusiones del Doctor Faustino* (1875), was received with marked disfavour, and that it has the faults of over-refinement and of cruelty; yet in keen analysis and in humour it surpasses *Pepita Jiménez.* The *Comendador Mendoza* (1877) is more pathetic and of a profounder significance; and if *Doña Luz* (1879) repeats the situation and the general idea already used in *Pepita Jiménez,* it strikes a deeper and more tragic note, which came as a surprise to those familiar only with the lighter side of Valera's genius. Besides these elaborate psychological studies, Valera issued a volume of *Cuentos* (1887), some of these short tales and dialogues being marvels of art and of insight. Thenceforward he was silent for eight years, but after his retirement from politics he published several good books—*El hechicero* (1895), *Juanita la larga* (1896), *Genio y figura* (1897), *De varios colores* (1898) and *Morsamor* (1899). These are not all of equal excellence, but they are characteristic of their author, and abound in understanding, humorous comment and sympathetic creation.

At the close of the 19th century Valera was recognized as the most eminent man of letters in Spain. He had not Pereda's force nor his energetic realism; he had not the copious invention nor the reforming purpose of Pérez Galdós; yet he was as realistic as the former and as innovating as the latter. And, for all his cosmopolitan spirit, he fortunately remained intensely and incorrigibly Spanish. His aristocratic scepticism, his strange elusiveness, his incomparable charm are his own: his humour, his flashing irony, his urbanity are eminently the gifts of his land and race. He is by no means an impersonal artist; in almost every story there is at least one character who talks and thinks and subtilizes and refines as Valera himself wrote in his most brilliant essays. This may be a fault in art; but, if so, it is a fault which many great artists have committed, from Cervantes to Thackeray. It is dangerous to attempt a forecast of Valera's final place in literary history, yet it seems safe to say that, though his poems and essays will be forgotten, *Pepita Jiménez* and *Doña Luz* will survive changes of fashion and of taste, and that their author's name will be inseparably connected with the renaissance of the modern Spanish novel. (J. F.-K.)

VALERIA, VIA, an ancient highroad of Italy, the continuation north-eastwards of the Via Tiburtina (*q.v.*). It probably owed its origin to M. Valerius Messalla, censor in 154 B.C. It ran first up the Anio valley past Varia (*q.v.*), and then, abandoning it at the 36th mile, where the Via Sublacensis diverged, ascended to Carseoli (*q.v.*), and then again to the lofty pass of Monte Bove (4003 ft.), whence it descended again to the valley occupied by the Lago di Fucino (*q.v.*). It is doubtful whether it ran farther than the eastern point of the territory of the Marsi at Cerfennia, to the N.E. of the Lacus Fucinus, before the time of Claudius. Strabo states that in his day it went as far as Corfinium, and this important place must have been in some way accessible from Rome, but probably, beyond Cerfennia, only by a track. The difficult route from Cerfennia to the valley of the Aternus—a drop of nearly 1000 ft., involving too the crossing of the main ridge of the Apennines (3675 ft.) by the Mons Imeus (mod. Forca Caruso)—was, however, probably not made into a highroad until Claudius's reign: one of his milestones (*Corp. Inscr. Lat.* ix. 5973) states that he in A.D. 48–49 made the Via Claudia Valeria from Cerfennia to the mouth of the Aternus (mod. Pescara). He also constructed a road, the Via Claudia Nova, connecting the Via Salaria, which it left at Foruli (mod. Civitatomassa, near Amiternum) with the Via Valeria near the modern Popoli. This road was continued south (we do not know by whom or when) to Aesernia. From Popoli the road followed the valley of the Aternus to its mouth, and there joined the coast-road at Pescara. The modern railway from Rome to Castellammare Adriatico follows closely the line of the Via Valeria.

See E. Albertini in *Mélanges de l'École française de Rome* (1907), 463 sqq. (T. As.)

VALERIAN, a genus of herbaceous perennial plants of the natural order Valerianaceae. Two species—*Valeriana officinalis* and *V. dioica*—are indigenous in Britain, while a third, *V. pyrenaica,* is naturalized in some parts. The valerians have opposite leaves and small flowers, usually of a white or reddish tint, and arranged in terminal cymes. The limb of the calyx is remarkable for being at first inrolled and afterwards expanding in the form of a feathery pappus which aids in the dissemination of the fruit. The genus comprises about 150 species, which are widely distributed in the temperate parts of the world. In medicine the root of *V. officinalis* is intended when valerian is mentioned. The plant grows throughout Europe from Spain to the Crimea, and from Iceland through northern Europe and Asia to the coasts of Manchuria. Several varieties of the plant are known, those growing in hilly situations being considered the most valuable for medicinal purposes.

Habit after Curtis, *Flora Londinensis.*

FIG. 1.—Valerian (*Valeriana officinalis*), one-third natural size. 1, flower; 2, flower after removal of corolla; 3, fruit crowned by the feathery pappus. 1, 2, 3 enlarged.

Valerian is cultivated in England (in several villages near Chesterfield in Derbyshire), but to a much greater extent in Prussian Saxony (in the neighbourhood of Cölleda, north of Weimar), in Holland and in the United States (Vermont, New Hampshire and New York). The dried root or rhizome consists of a short central erect portion, about the thickness of the little finger, surrounded by numerous rootlets about $\frac{1}{10}$ of an inch in diameter, the whole being of a dull brown colour. When first taken from the ground it has no distinctive smell; but on drying it acquires a powerful odour of valerianic acid. This odour, now regarded as intolerable, was in the 16th century considered to be fragrant, the root being placed among clothes as a perfume (Turner, *Herbal,* 1568, part iii. p. 76), just as *V. celtica* and some Himalayan species of the genus are still used in the East. By the poorer classes in the north of England it was esteemed of such medicinal value that "no broth, pottage or physical meat" was considered of any value without it (Gerard, *Herball,* 1633, p. 1078).

The red valerian of gardens is *Centranthus ruber,* also belonging to the Valerianaceae; but Greek valerian is *Polemonium coeruleum,* belonging to the natural order Polemoniaceae. Cats are nearly as fond of the smell of this plant as of the true valerian, and will frequently roll on the plant and injure it.

The chief constituent of valerian is a volatile oil, which is present in the dried root to the extent of 1–2 %, plants growing on dry or stony soil being said to yield the largest quantity. The oil is of complex composition, containing valerianic (valeric), formic and acetic acids combined with a terpene, $C_{10}H_{16}$; the alcohol known as borneol; and pinene. The valerianic acid present in the oil is not the normal acid, but isovalerianic acid. It occurs in many plants and in cod-liver oil. It is strongly acid, burning to the palate, and with the odour of the plant. The oil is soluble in thirty parts of water and readily in alcohol and ether. The British Pharmacopeia contains the tinctura valerianae ammoniata, containing valerian, oil of nutmeg, oil of lemon and ammonia. It is an extremely nauseous and offensive preparation. The valerianate of zinc is also official in Great Britain, but, like valerianic acid itself, it is pharmacologically inert and therapeutically useless.

Valerian acts medicinally entirely in virtue of its volatile oil, which exerts the actions typical of its class. The special use of this drug, like that of others which contain an offensive volatile oil—such as asafoetida—is in hysteria or, as it is more properly styled, neuromimesis. It is generally believed that the drug acts in virtue of its unpleasant odour and taste, which cause the patient to display so much volition as shall enable him or her to control the symptoms and thereby obtain the discontinuance of the drug. Good results are sometimes obtained, however, when the drug is given in capsules or in some other form which puts this mode of action out of the question. Binz of Bonn has shown that the volatile oils act as sedatives of the motor cells in the anterior horns of grey matter in the spinal cord, and it is probable that this action may account for the good results often obtained by the use of valerian in neuromimesis; though there is little doubt that the *modus operandi* above described may also come into play. The valerianates of iron, quinine, guaiacol and sodium share with that of zinc the disability of exerting no action attributable to their acid radicle, but have frequently been employed. Valerianic diethylamide, or valyl, has also been employed as a substitute for the preparations in ordinary use.

VALERIANUS, PUBLIUS LICINIUS, Roman emperor from A.D. 253 to 260. He was of noble family, and in 238 was *princeps senatus*. In 251, when Decius revived the censorship with legislative and executive powers so extensive that it practically embraced the civil authority of the emperor, Valerian was chosen censor by the senate. After the death of Decius Valerian retained the confidence of his successor, Trebonianus Gallus, who sent him to fetch troops to quell the rebellion of Aemilianus, governor of Moesia and Pannonia. The soldiers in Raetia, however, proclaimed Valerian emperor; and marching slowly towards Rome he found both his rivals dead, slain by their own soldiers. Valerian was about sixty-three years of age, and had scarcely the vigour to deal with the enemies that threatened every frontier of the empire. Taking his son Gallienus as colleague, he left the wars in Europe to his direction, under which matters went from bad to worse and the whole West fell into disorder. Valerian chose for his own part the war in the East, where Antioch had fallen into the hands of a Persian vassal and Armenia was occupied by Shapur (Sapor) I., while in 258 the Goths ravaged Asia Minor. Valerian recovered Antioch, fought in Mesopotamia with mixed success and finally was taken captive. It is said that he was subjected to the greatest insults by his captors, and that after his death his skin was stuffed with straw and preserved as a trophy in the chief Persian temple. Owing to imperfect and contradictory authorities, the chronology and details of this reign are very uncertain.

See Trebellius Pollio, *Life of Valerian* (frags.); Aurelius Victor, *Caesares*, 32; Eutropius ix. 6; Ammianus Marcellinus xxiii. 5; Zosimus i. 27; Gibbon, *Decline and Fall*, chap. 10; H. Schiller, *Geschichte der römischen Kaiserzeit*, i. pt. 2.

VALERIC ACID, or VALERIANIC ACID, $C_4H_9 \cdot CO_2H$, an organic acid belonging to the fatty acid series, which exists in four isomeric forms, one of which contains an asymmetric carbon atom and consequently occurs in two optically active modifications and one optically inactive modification. Ordinary valeric acid (baldrianic acid) is a mixture of isovaleric acid or isopropylacetic acid, $(CH_3)_2CH \cdot CH_2 \cdot CO_2H$, and optically active methylethylacetic acid, $(CH_3)(C_2H_5)CH \cdot CO_2H$, which occur free or as esters in the vegetable and animal kingdoms, chiefly in the roots of *Angelica archangelica* and *Valeriana officinalis*. It may be extracted by boiling with water or soda. A similar product is obtained by oxidizing fermentation amyl alcohol with chromic acid. Isovaleric acid is an oily liquid having the odour of stale cheese and boiling at 174°; the salts are usually greasy to the touch. Potassium permanganate oxidizes it to β-oxyisovaleric acid $(CH_3)_2 \cdot C(OH) \cdot CH_2 \cdot CO_2H$, whilst nitric acid gives, among other products, dinitropropane, $(CH_3)_2C(NO_2)_2$. The acid has been synthesized, as has also the inactive form of methylethylacetic acid; this modification is split into its optical antipodes by crystallization of its brucine salt. Normal valeric acid or propylacetic acid, $CH_3 \cdot CH_2 \cdot CH_2 \cdot CH_2 \cdot CO_2H$, is a liquid boiling at 186°. The remaining isomer, pivalic or trimethylacetic acid, $(CH_3)_3C \cdot CO_2H$, melts at 35° and boils at 163°. Both these acids are synthetic products.

VALERIUS, PUBLIUS, surnamed PUBLICOLA (or POPLICOLA), "friend of the people," the colleague of Brutus in the consulship in the first year of the Roman republic (509 B.C.). According to Livy and Plutarch, his family, whose ancestor Volusus had settled in Rome at the time of King Tatius, was of Sabine origin. He took a prominent part in the expulsion of the Tarquins, and though not originally chosen as the colleague of Brutus he soon took the place of Tarquinius Collatinus. On the death of Brutus, which left him sole consul, the people began to fear that he was aiming at kingly power. To calm their apprehensions he discontinued the building of his house on the top of the Velian Hill, and also gave orders that the fasces should be lowered whenever he appeared before the people. He further introduced two laws to protect the liberties of the citizens, one enacting that whosoever should attempt to make himself a king might be slain by any man at any time, while another provided an appeal to the people on behalf of any citizen condemned by a magistrate (*lex Valeria de provocatione*: see ROME, *History*, II. "The Republic"). He died in 503, and was buried at the public expense, the matrons mourning him for ten months.

Livy ii. 6–8; Dion. Halic. iv. 67, v. 12–40; *Life* by Plutarch.

VALERIUS FLACCUS, GAIUS, Roman poet, flourished under Vespasian and Titus. He has been identified on insufficient grounds with a poet friend of Martial (i. 61. 76), a native of Padua, and in needy circumstances; but as he was a member of the College of Fifteen, who had charge of the Sibylline books (i. 5), he must have been well off. The subscription of the Vatican MS., which adds the name Setinus Balbus, points to his having been a native of Setia in Latium. The only ancient writer who mentions him is Quintilian (*Instit. Orat.* x. 1. 90), who laments his recent death as a great loss, although it does not follow that he died young; as Quintilian's work was finished about A.D. 90, this gives a limit for the death of Flaccus. His work, the *Argonautica*, dedicated to Vespasian on his setting out for Britain, was written during the siege, or shortly after the capture, of Jerusalem by Titus (70). As the eruption of Vesuvius (79) is alluded to, it must have occupied him a long time. The *Argonautica* is an epic in eight books on the Quest of the Golden Fleece. The poem is in a very corrupt state, and ends abruptly with the request of Medea to accompany Jason on his homeward voyage. It is a disputed question whether part has been lost or whether it was ever finished. It is a free imitation and in parts a translation of the work of Apollonius of Rhodes (*q.v.*), already familiar to the Romans in the popular version of Varro Atacinus. The object of the work has been described as the glorification of Vespasian's achievements in securing Roman rule in Britain and opening up the ocean to navigation (as the Euxine was opened up by the Argo). Various estimates have been formed of the genius of Flaccus, and some critics have ranked him above his original, to whom he certainly is superior in liveliness of description and delineation of character. His diction is pure, his style correct, his versification smooth though monotonous. On the other hand, he is wholly without originality, and his poetry, though free from glaring defects, is artificial and elaborately dull. His model in language was Virgil, to whom he is far inferior in taste and lucidity. His tiresome display of learning, rhetorical exaggeration and ornamentations make him difficult to read, which no doubt accounts for his unpopularity in ancient times.

The *Argonautica* was unknown till the first four and a half books were discovered by Poggio at St Gall in 1417. The *editio princeps* was published at Bologna (1474). Recent editions by G. Thilo (1863), with critical notes; C. Schenkl (1871), with bibliography; E. Bährens (1875), with critical introduction; P. Langen (1896), with Latin notes, and short introductions on the style and language; Caesar Giarratano (1904); see also J. Peters, *De V. F. Vita et Carmine* (1890); W. C. Summers, *Study of the Argonautica* (1894).

VALERIUS MAXIMUS, Latin writer, author of a collection of historical anecdotes, flourished in the reign of Tiberius. Nothing is known of his personal history except that his family was poor and undistinguished, and that he owed everything to Sextus Pompeius (consul A.D. 14), proconsul of Asia, whom he accompanied to the East in 27. This Pompeius was a kind of minor Maecenas, and the centre of a literary circle to which Ovid belonged; he was also the intimate of the most literary prince of the imperial family, Germanicus. The style of Valerius's writings seems to indicate that he was a professional rhetorician. In his preface he intimates that his work is intended as a commonplace book of historical anecdotes for use in the schools of rhetoric, where the pupils were trained in the art of embellishing speeches by references to history. According to the MSS., its title is *Nine Books of Memorable Deeds and Sayings.* The stories are loosely and irregularly arranged, each book being divided into sections, and each section bearing as its title the topic, most commonly some virtue or vice, or some merit or demerit, which the stories in the section are intended to illustrate. Most of the tales are from Roman history, but each section has an appendix consisting of extracts from the annals of other peoples, principally the Greeks. The exposition exhibits strongly the two currents of feeling which are intermingled by almost every Roman writer of the empire—the feeling that the Romans of the writer's own day are degenerate creatures when confronted with their own republican predecessors, and the feeling that, however degenerate, the latter-day Romans still tower above the other peoples of the world, and in particular are morally superior to the Greeks.

The author's chief sources are Cicero, Livy, Sallust and Pompeius Trogus, especially the first two. Valerius's treatment of his material is careless and unintelligent in the extreme; but in spite of his confusions, contradictions and anachronisms, the excerpts are apt illustrations, from the rhetorician's point of view, of the circumstance or quality they were intended to illustrate. And even on the historical side we owe something to Valerius. He often used sources now lost, and where he touches on his own time he affords us some glimpses of the much debated and very imperfectly recorded reign of Tiberius. His attitude towards the imperial household has often been misunderstood, and he has been represented as a mean flatterer of the same type with Martial. But, if the references to the imperial administration be carefully scanned, they will be seen to be extravagant neither in kind nor in number. Few will now grudge Tiberius, when his whole action as a ruler is taken into account, such a title as *salutaris princeps*, which seemed to a former generation a specimen of shameless adulation. The few allusions to Caesar's murderers and to Augustus hardly pass beyond the conventional style of the writer's day. The only passage which can fairly be called fulsome is the violently rhetorical tirade against Sejanus. But it is as a chapter in the history of the Latin language that the work of Valerius chiefly deserves study. Without it our view of the transition from classical to silver Latin would be much more imperfect than it is. In Valerius are presented to us, in a rude and palpable form, all the rhetorical tendencies of the age, unsobered by the sanity of Quintilian and unrefined by the taste and subtlety of Tacitus. Direct and simple statement is eschewed and novelty pursued at any price. The barrier between the diction of poetry and that of prose is broken down; the uses of words are strained; monstrous metaphors are invented; there are startling contrasts, dark innuendoes and highly coloured epithets; the most unnatural variations are played upon the artificial scale of grammatical and rhetorical figures of speech. It is an instructive lesson in the history of Latin to compare minutely a passage of Valerius with its counterpart in Cicero or Livy. In the MSS. of Valerius a tenth book is given, which consists of the so-called *Liber de Praenominibus*, the work of some grammarian of a much later date. The collection of Valerius was much used for school purposes, and its popularity in the middle ages is attested by the large number of MSS. in which it has been preserved. Like other schoolbooks it was epitomated. One complete epitome, probably of the 4th or 5th century, bearing the name of Julius Paris, has come down to us; also a portion of another by Januarius Nepotianus. Editions by C. Halm (1865), C. Kempf (1888), contain the epitomes of Paris and Nepotianus.

VALET (Fr. *valet*; O. Fr. *vaslet*), a term now restricted in meaning to that of a gentleman's personal servant. The origin of the word is debated. Du Cange (*Glossarium*, s. *Valeti*) explains it as the diminutive of *vassallus*, a vassal, the sons of *vassalli* being termed *vasseleti* (and so *vasleti, valeti*), on the analogy of *domicelli* (*damoiseaux*) for the sons of *domini*. This view is also taken by W. W. Skeat (*Etym. Dict.* s. "Varlet"); but Hatzfeld and Darmesteter (*Dict. gén. de la langue française*), dispute this derivation as phonetically impossible, preferring that from *vassulittus* from a hypothetical *vassulus*, diminutive of *vassus*, from which *vassallus* also is ultimately derived (see VASSAL). Just as *vassus* was in Merovingian times the Gallo-Roman word for "servitor," which the Franks borrowed to designate the domestic soldiers of their kings, so "valet" retained this, its sole surviving sense, throughout the middle ages. Yet the phrase "gentleman's gentleman," commonly used of the modern valet, is more historical than may at first sight appear. For valet, like esquire (*écuyer*), long signified the apprentice stage of knighthood, at first with a certain difference, the esquire being mounted, the valet unmounted, but afterwards with scarce a shade of distinction. Later, "valet" became the usual term for gentlemen who were not knights. In England it was not till the early years of the 14th century that *valletus* in this sense was superseded by *armiger*, and that "valet" (valete, vadlete, verlet, varlet[1]) began to be applied to the class of free men below the rank of esquire. In France the word *valet*, though in Saintonge and Poitou it survived till the close of the 14th century, had elsewhere—like *damoiseau*—much earlier been replaced generally by *écuyer* as the designation of an unknighted gentleman.

At the outset, "valet" had meant no more than "youth" or "boy." Thus Wace in the *Roman de Rou* (III. v. 2903), speaking of William the Conqueror, says: *Guillaume fu vadlet petiz* ("William was a little boy"). The various developments of the word are closely parallel with those of some of its synonyms. Youth suggested both strength and service, the qualifications for nobility in a primitive society, where service in arms was the title to rank. *Puer* (boy) was early used, as a synonym for *vassus*, of the soldiers of the Frankish bodyguard (*pueri ad ministerium*); the Greek *τέκνον* ("child") is etymologically related to O.H. Ger. *degan*, M.H. and Mod. Ger. *degen*, "warrior," A.S. *thegn*, "thane"; "child" itself was applied in the 13th and 14th centuries to young men of gentle birth awaiting knighthood, as a title of dignity, and was perhaps a translation of *valet* (see CHILD), with which may be compared the Spanish *infanzon* and German *junker*. So, too, *cniht* (a "lad" or "servant"), becomes first a warrior and then develops into a title of dignity as "knight," while in Germany the parallel word *knecht* remains as "servant." But valet has also shared with other synonyms a downward development. Just as "knave" (*cnafa*) meant originally a boy (cf. Ger. *knabe*) or servant, and has come to mean a rogue, so *valet* in its English (15th century) form of "varlet" had decayed, before it became obsolete, from its meaning of "servant" to signify a "scoundrel" or "low fellow."

See Du Cange, *Glossarium* (ed. Niort, 1887); A. Luchaire, *Manuel des institutions françaises* (Paris, 1892); P. Giulhiermoz, *Essai sur l'origine de la noblesse en France au moyen âge* (Paris, 1902); Note on the word "Valet" by Maurice Church, App. xix. to Sir R. Hennell's *Hist. of the Yeomen of the Guard* (Westminster, 1904).
(W. A. P.)

VALHALLA (Old Norse *Valhöll, i.e.* "hall of the slain"), the name given by the heathen Scandinavians to the abode in which the god Odin received the souls of those who had fallen in battle. There they are represented as spending their time in constant fighting and feasting in his service. See TEUTONIC PEOPLES, *ad fin.*

VALKYRIES (Old Norse *valkyriur*, "choosers of the slain"), figures of Northern mythology, generally represented as divine (less frequently human) maidens who ride through the air on Odin's service. Clad in full armour they are sent forth

[1] The form *valectus* led to the spelling *valect* in transcribing from Latin documents.

to determine the course of battles and to select brave warriors for Valhalla (*q.v.*). Beings with the same name (*waelcyrgean*) were known also in England, where we find them associated with witches. The name is used in Anglo-Saxon glossaries to translate various Latin terms for "War-goddess" or "Fury" (Bellona, Erinys, &c.). See TEUTONIC PEOPLES, *ad fin.* (H. M. C.)

VALLA, LORENZO, or LAURENTIUS (*c.* 1406–1457), Italian humanist, was born at Rome, of parents from the neighbourhood of Piacenza, about 1406, his father, Luca delle Vallea, being an advocate. He was educated at Rome, attending the classes of eminent professors, among them Leonardi Bruni and Giovanni Aurispa (*c.* 1369–1459), from whom he learned Latin and Greek. In 1431 he became a priest, and after trying vainly to secure a position as apostolic secretary in Rome he went to Piacenza, whence he proceeded to Pavia, where he obtained a professorship of eloquence. Valla wandered from one university to another, accepting short engagements and lecturing in many cities. During this period he made the acquaintance of Alphonso V. of Aragon, whose service he entered about 1435. Alphonso made Valla his private secretary, defended him against the attacks of his numerous enemies, and at a later date encouraged him to open a school in Naples.

By this time Valla had won a high reputation by his dialogue *De Voluptate*, and by his treatise *De Elegantiis Latinae Linguae*. In the former work he contrasted the principles of the Stoics with the tenets of Epicurus, openly proclaiming his sympathy with those who claimed the right of free indulgence for man's natural appetites. It was a remarkable utterance. Here for the first time the paganism of the Renaissance found deliberate expression in a work of scholarly and philosophical value. *De Elegantiis* was no less original, although in a different sphere of thought. This work subjected the forms of Latin grammar and the rules of Latin style and rhetoric to a critical examination, and placed the practice of composition upon a foundation of analysis and inductive reasoning. The same originality and critical acumen were displayed in his treatise on the Donation of Constantine (*De falso credita et ementita Constantini donatione declamatio*), written in 1439 during the pontificate of Eugenius IV., in which the nature of the forged document known as the *Constitutum Constantini* was for the first time exposed (see DONATION OF CONSTANTINE). From Naples Valla continued his war against the Church. He showed that the supposed letter of Christ to Abgarus was a forgery, and by throwing doubt upon the authenticity of other spurious documents, and by questioning the utility of monastic life, he aroused the anger of the faithful. He was compelled to appear before an inquisitory tribunal composed of his enemies, and he only escaped by the special intervention of Alphonso. He was not, however, silenced; he ridiculed the Latin of the Vulgate and accused St Augustine of heresy. In 1444 he visited Rome, but in this city also his enemies were numerous and powerful, and he only saved his life by flying in disguise to Barcelona, whence he returned to Naples. But a better fortune attended him after the death of Eugenius IV. in February 1447. Again he journeyed to Rome, where he was welcomed by the new pope, Nicholas V., who made him an apostolic secretary, and this entrance of Valla into the Roman Curia has been justly called "the triumph of humanism over orthodoxy and tradition." Valla also enjoyed the favour of Pope Calixtus III. He died in Rome on the 1st of August 1457.

All the older biographical notices of Valla are loaded with long accounts of his many literary and theological disputes, the most famous of which was the one with Poggio (*q.v.*), which took place after his settlement in Rome. It is almost impossible to form a just estimate of Valla's private life and character owing to the clouds of dust which were stirred up by this and other controversies, in which the most virulent and obscene language was employed. He appears, however, as a vain, jealous and quarrelsome man, but he combined the qualities of an elegant humanist, an acute critic and a venomous writer, who had committed himself to a violent polemic against the temporal power of Rome. In him posterity honours not so much the scholar and the stylist as the man who initiated a bold method of criticism, which he applied alike to language, to historical documents and to ethical opinions. Luther had a very high opinion of Valla and of his writings, and Cardinal Bellarmine calls him *praecursor Lutheri*, while Sir Richard Jebb says that his *De Elegantiis* "marked the highest level that had yet been reached in the critical study of Latin."

Collected, but not quite complete, editions of Valla's works were published at Basel in 1540 and at Venice in 1592 fol., and *De Elegantiis* was reprinted nearly sixty times between 1471 and 1536. For detailed accounts of Valla's life and work see G. Voigt, *Die Wiederbelebung des classischen Alterthums* (1880–81); J. A. Symonds, *Renaissance in Italy* (1897–99); G. Mancini, *Vita di Lorenzo Valla* (Florence, 1891); M. von Wolff, *Lorenzo Valla* (Leipzig, 1893); J. Burckhardt, *Kultur der Renaissance* (1860); J. Vahlen, *Laurentius Valla* (Berlin, 1870); L. Pastor, *Geschichte der Päpste*, Band ii. English trans. by F. I. Antrobus (1892); the article in Herzog-Hauck's *Realencyklopädie*, Band xx. (Leipzig, 1908); and J. E. Sandys, *Hist. of Class. Schol.* ii. (1908), pp. 66–70.

VALLADOLID, an inland province of Spain, one of the eight into which Old Castile was divided in 1833; bounded on the N. by Leon and Palencia, E. by Burgos, S. by Segovia, Ávila and Salamanca, and W. by Zamora. Pop. (1900) 278,561; area, 2922 sq. m. The province belongs entirely to the basin of the Duero (Douro), which traverses it from E. to W., and within its limits receives the Pisuerga (with the Esgueva) on the right, and the Duraton, the Cega, the united Adaja and Eresma, the Zapardiel and the Trabancos on the left. The country watered by these rivers is for the most part flat and exceedingly fertile, the only part that can be called in any sense hilly being in the north-west, where the low Montes de Torozos occur. For the excellence and abundance of its grain crops Valladolid shares with the Tierra de Campos in Palencia the title of granary of the Peninsula.

Besides wheat, maize, barley and oats, the province produces hemp, flax, various fruits, red and white wine, oil and madder. The Montes de Torozos are thinly covered with oaks and other timber, and there are forests in the S.E. The pastures are extensive and large numbers of asses, mules and sheep, as well as some horses and cattle, are reared. Honey, wax and silk are also produced. The woollen fabrics of Valladolid were once highly esteemed, but this industry has now greatly declined, although in the larger towns there are still linen and cloth factories, besides iron foundries, tanneries, saw-mills and flour-mills. But agriculture is by far the foremost industry of the province. Trade is facilitated by the Canal de Castilla, which connects Valladolid, on the Pisuerga, with Alar del Rey, in Palencia, also on that river. See PALENCIA (province). Valladolid is traversed by the national highways from Madrid to Santander, Leon and Corunna, and by the Calatayud and Salamanca roads. It is also traversed from N. to S. by the northern railway from Madrid to France via Irun, which has branches from Valladolid to Medina del Rioseco, and from Medina del Campo to Salamanca and Zamora. Apart from the capital Valladolid, Nava del Rey (6148), Medina del Campo (5971) and Medina del Rioseco (5007) are the only towns with more than 5000 inhabitants. For an account of the people and history of the province, see CASTILE.

VALLADOLID, a town of Mexico, in the state of Yucatan, 90 m. S.E. of Merida, with which it is connected by rail. Pop. about 5000. It is situated in a healthy and fertile part of Yucatan, and is a resort for invalids. It has a number of old churches, a Jesuits' college, town hall, hospital and aqueduct, and the better class of residences are of the usual type, low, large-roomed structures in the midst of gardens. It was founded in 1544, soon after the conquest, and was planned to be a great ecclesiastical centre, but these plans were not realized and its churches and other fine buildings have fallen into decay. Its manufactures include cotton goods and tobacco. The inhabitants, chiefly descendants of the ancient Mayas, have frequently revolted against their rulers. In 1910 they were in a state of insurrection, assisted by the wild tribesmen of the neighbouring territory of Quintana Roo, on which occasion Valladolid was captured by them and many of its officials and prominent white residents were massacred.

VALLADOLID, the capital of the Spanish province of Valladolid, situated 2228 ft. above sea-level, at the confluence of the river Pisuerga with the Esgueva. Pop. (1900) 68,789. Valladolid is an archbishopric, and the seat of an army corps, a court of appeal and a university. It is connected by numerous railways with every province of Spain. Its site is a small valley, enclosed by steep and rugged but not very high hills, which merge into the vast upland plain of Castile. The city was formerly surrounded by walls and entered by four principal gates, but it has been to a great extent modernized, and possesses many fine streets and squares. There are broad avenues and public gardens beside the rivers. Among the chief open spaces are the arcaded Plaza Mayor, the Campo Grande, a wooded park and the Paseo de la Avenida, a wide boulevard in which is the statue of the poet José Zorilla (1817–1893). The granite cathedral was begun in 1585 by Juan de Herrera in the Renaissance style. Herrera's original model is preserved in the muniment-room, but only the nave and one tower (out of four) were completed after his design, and the tower fell in 1841. The building was continued by Churriguera (d. 1725). The interior contains some pictures by Luca Giordana (1623–1705) and the celebrated silver monstrance wrought by Juan de Arphe (b. 1523), which is 6½ ft. high; it is in the form of a temple, decorated with figures of Adam and Eve in the garden of Eden. The tower and nave of the church of Santa Maria la Antigua date from about 1200. The church of San Pablo is later (1286); its chief feature of interest is a beautiful Flamboyant portal, and formerly it had exquisite cloisters. Adjoining is San Gregorio (15th century) with a fine Plateresque façade. San Benito, dating from the end of the 14th century, is a Gothic building with a lofty roof finely groined. The Plateresque college of Santa Cruz, built by Enrique de Egas in 1479–92, contains an interesting collection of pictures and sculptures, including three pictures by Rubens, which have been somewhat damaged, and some remarkable wooden statues by Alonso Berruguete (d. 1581) and others. The college of San Gregorio, dating from the same period, was wrecked by the French in 1808, but has a magnificent late Gothic façade. This building has been converted into municipal offices. The university is attended by about 1200 students, and has faculties of law, medicine, natural science, philosophy and literature. Originally founded at Palencia early in the 13th century, it was transferred to Valladolid before 1250 and attained its greatest prosperity from the 16th century to the 18th. The library contains many rare MSS. The university buildings date from the 17th century and are extravagantly ornate. Among other public buildings of Valladolid may be mentioned the royal palace, built in the beginning of the 17th century, the court-house, the town hall, several convents used as barracks, the provincial institute, training schools for teachers and primary schools, royal academy for cavalry cadets, provincial lunatic asylum, hospitals, seminary (raised in 1897 by Pope Leo XIII. to the rank of a pontifical university), archaeological museum, picture gallery and public library. The house in which Cervantes lived (1603–1606) is owned by the state. The principal industries are the manufacture of linen, silk and woollen fabrics, pottery, gold and silver work, flour, wine, beer, chocolate, leather, ironware and paper. There is also a large agricultural trade.

Valladolid is sometimes identified with the ancient Pintia of Ptolemy, described as a town of the Vaccaei on the road from Asturica to Caesaraugusta. Its Roman origin is uncertain. The present name is undoubtedly Moorish, but its meaning is obscure. Valladolid was recovered from the Moors in the 10th century, but is first named in a public document by Sancho II. of Leon in 1072. The cortes of Castile frequently met here in the following centuries, and in the beginning of the 15th century John II. made it his principal residence. After the removal of the capital to Madrid by Philip II. in 1560 it began rapidly to decay. In December 1808 it was taken and sacked by the French, who destroyed many fine buildings and works of art. Columbus died (1506) and Philip II. was born (1527) at Valladolid.

VALLANDIGHAM, CLEMENT LAIRD (1820–71), American politician, was born in New Lisbon, Ohio, on the 29th of July 1820. He was educated in the common schools and afterwards studied law and was admitted to the bar in 1842. Elected to the Ohio House of Representatives in 1845, he became one of the extremest of the state rights Democrats of his section, emphasizing his principles in the legislature in the local and national party conventions, and in the columns of a newspaper, the *Western Empire*, which he edited at Dayton, Ohio, in 1847–49. From 1858 to 1863 he was in the lower house of Congress, where he was noted for his strong opposition to the principles and policies of the growing Republican party, his belief that the South had been grievously wronged by the North, his leadership of the Peace Democrats or Copperheads, who were opposed to the prosecution of the war, and his bitter attacks upon the Lincoln administration, which, he said, was destroying the Constitution and would end by destroying civil liberty in the North. Attempts were made to expel him, but without success. In 1863 he made violent speeches in Ohio against the administration, and for these he was arrested by the military authorities, tried by military commission, and sentenced to imprisonment. President Lincoln commuted this sentence to banishment, and Vallandigham was sent into the Confederate lines, whence he made his way to Canada. While in exile he was elected supreme commander of the Knights of the Golden Circle in Ohio and received the Democratic nomination for governor of Ohio, but was defeated. In 1864 he returned to Ohio, took active part in the campaign of that year, wrote part of the National Democratic platform at Chicago, and assisted to nominate McClellan for the presidency. After the war he denounced the Reconstruction policy of the Republicans as unconstitutional and tyrannical, but in 1870, seeing the uselessness of further opposition, he advised his party to accept the situation and adopt new issues. He thus initiated what was known as the "New Departure" Democratic movement. Vallandigham was a good lawyer and a popular politician. He was fanatically devoted to the Constitution as he understood that document, and in his course during the war he was not, as his enemies asserted, trying to aid the Confederates, but merely desirous of restoring "the Union as it was." He died in Lebanon, Ohio, on the 17th of June 1871.

See J. L. Vallandigham, *Life of Clement L. Vallandigham* (Baltimore, 1872); and J. F. Rhodes, *History of the United States from the Compromise of 1850* (New York, 1893–1906).

VALLE, PIETRO DELLA (1586–1652), Italian traveller in the East, came of a noble Roman family, and was born on the 11th of April 1586, in the family palace built by Cardinal Andrea. His early life was divided between the pursuits of literature and arms. He saw active service against the Moors of Barbary, but also became a member of the Roman academy of the Umoristi, and acquired some reputation as a versifier and rhetorician. The idea of travelling in the East was suggested by a disappointment in love, as an alternative to suicide, and was ripened to a fixed purpose by a visit to the learned Mario Schipano, professor of medicine in Naples, to whom the record of Pietro's travels was addressed in the form of very elaborate letters, based on a full diary. Before leaving Naples he took a vow of pilgrimage to the Holy Land, and, sailing from Venice on the 8th of June 1614, reached Constantinople, where he remained for more than a year, and acquired a good knowledge of Turkish and a little Arabic. On the 25th of September 1615 he sailed for Alexandria with a suite of nine persons, for he travelled always as a nobleman of distinction, and with every advantage due to his rank. From Alexandria he went on to Cairo, and, after an excursion to Mount Sinai, left Cairo for the Holy Land on the 8th of March 1616, in time to assist at the Easter celebrations at Jerusalem. Having visited the holy sites, he journeyed by Damascus to Aleppo, and thence to Bagdad, where he married a Syrian Christian named Maani, a native of Mardin, who died in 1621. He now desired to visit Persia; but, as that country was then at war with Turkey, he had to leave Bagdad by stealth on the 4th of January 1617. Accompanied by his wife he proceeded by Hamadan to Isfahan, and joined Shah Abbas in a campaign in northern Persia, in the summer of 1618. Here he was well received at court and treated as the shah's guest. On his return to Isfahan he began to think of returning by India rather than adventure himself again in Turkey; but the state of his health, and the war between Persia and the Portuguese at Ormuz, created difficulties. In October 1621 he started from Isfahan, and, visiting Persepolis and Shiraz, made his way to the coast; but it was not till January 1623 that he found passage for Surat on the English ship "Whale." In India he remained till November 1624, his headquarters being Surat and Goa. He was at Muscat in January 1625, and at Basra in March. In May he started by the desert route for Aleppo, and took ship at Alexandretta on a French vessel. Touching at Cyprus he reached Rome on the 28th of March 1626, and was received with much honour, not only by literary circles, but by Pope Urban VIII., who appointed him a gentleman of his bedchamber. The rest of his life was uneventful; he married as second wife a Georgian orphan of noble family, Mariuccia (Tinatin de Ziba), whom his first wife had adopted as a child, and who had accompanied him in all his journeys. By her he had fourteen sons. He died at Rome on the 21st of April 1652.

In Pietro della Valle's lifetime there were printed—(1) a *Funeral Oration on his Wife Maani*, whose remains he brought with him to Rome and buried there (1627); (2) an *Account of Shah Abbas*, printed at Venice in 1628, but not published; (3) the first part of the letter describing his *Travels* (Turkey, 1650). The *Travels* in Persia (2 parts) were published by his sons in 1658, and the third part (India) in 1663. An English translation appeared in 1665 (fol.). Of the Italian text the editon of Brighton, 1843 (2 vols. 8vo), is more esteemed than the other reprints. It contains a sketch of the author's life by Gio. P. Bellori (1622). Della Valle's story is often prolix, with a tendency to the rhetorical; but he is clear and exact, well informed and very instructive, so that his work still possesses high value.

VALLEJO, a city of Solano county, California, U.S.A., on the San Pablo Bay, at the mouth of the Napa river, about 24 m. N.E. of San Francisco. Pop. (1890) 6343; (1900) 7965 (2033 foreign-born); (1910) 11,340. It is served by a branch of the Southern Pacific railway, by steamboats to San Francisco, and by an interurban electric line. The city is situated at the mouth of the great interior valley of the state, and has a good harbour, the channel of which, since the removal of a shoal by the Federal government in 1902–1906, has a maximum depth at low tide of 24 ft. Directly opposite the city, half a mile distant and connected by ferry, is Mare Island, the headquarters of the Pacific Naval Squadron of the United States, with a large United States Navy Yard, a naval arsenal, two stone dry docks (one 750 ft. long) and a lighthouse. The Navy Yard was established in 1854, and its first commandant was D. G. Farragut. In the city are a Carnegie library, St Vincent's Academy and a Good Templars' Home (1869) for orphans. Vallejo is the outlet of the beautiful Napa Valley, one of the finest fruit-growing regions of the state, and, besides fruit, ships large quantities of wheat. Among its manufactures are flour, leather, dairy products and lumber. The municipality owns and operates its waterworks, the water-supply being obtained from the mountains 25 m. distant. The city takes its name from General Mariano Guadalupe Vallejo, a prominent Mexican leader in the years immediately preceding the annexation of California to the United States. It was a dull and out-of-the-way settlement in 1851, when, through General Vallejo's efforts, it became the state capital. The state legislature met here in 1851, 1852 and 1853. In 1871 Vallejo ranked third in population among the cities of the state, and its position and the excellence of its harbour made it a rival of Oakland in the struggle (1869–72) for the terminus of the Central Pacific railway; but Vallejo was unsuccessful, and after 1872 began to decline in relative importance.

VALLÈS, JULES (1832–1885), French journalist and author, was born at Puys, France, on the 10th of June 1832. Coming to Paris, he joined the staff of the *Figaro*, and became a constant contributor to the other leading journals. In 1866 he republished much of his newspaper work in *Refractaires*, the volume forming a romance of the seamy side of Paris life. He was in Paris during the siege of 1870, and after the capitulation was a member of the Commune and founded *Le Cri du Peuple*. He took a conspicuous part in the fighting in the Paris streets, but finally made his escape to London, whence he contributed anonymously to the French press. In 1878 he began in the *Siècle* the serial publication of his principal work, *Jacques Vingtras*, a long autobiographical romance. He died in Paris on the 14th of February 1885.

VALLETTA, or VALETTA, the capital of Malta (since 1570). Pop. (1901) 24,685; or 40,406, including suburbs. The nucleus of the city is built on a ridge of rock (Mount Sceberras) which runs like a tongue into the middle of a bay, which it thus divides into two harbours, the Grand Harbour to the east and the Marsamuschetto to the west, which are subdivided again by three other peninsulas into creeks. On two of these peninsulas on the east side of the Grand Harbour, and at their base, are built the aggregate of towns called the Three Cities—Vittoriosa, Conspicua and Senglea (see MALTA). On the main promontory, with Valletta, stands the suburb Floriana; Fort St Elmo, with a lighthouse, stands on the extremity of the promontory; the suburb Sliema lies on the point which encloses the Marsamuschetto harbour; Fort Ricasoli on the opposite point enclosing the east, Grand, or Great Harbour. The streets of Valletta, paved with stone, run along and across the ridge, and end on each side towards the water in steep flights of steps. Many of the houses, which are of stone throughout, with flat roofs, are large and luxuriously built; wooden-covered balconies project from the windows and give a peculiar aspect to the streets. There are several fine public buildings, as the governor's palace, the new opera-house, the public library and museum of Maltese antiquities, and the *auberges* or lodges of the Knights of Malta (especially the Auberge de Castile) which are now used for military offices, club-rooms, and other purposes. Roman Catholic churches in Valletta are very numerous; the cathedral of S. Giovanni, dating from 1576, is famous for its rich inlaid marbles, its Brussels tapestries, its roof painted by Matteo Preti (1661–1699), the picture by Michael Angelo da Caravaggio of the beheading of John the Baptist, numerous memorials of the knights and other relics.

The governor's palace was formerly that of the grand master of the Maltese Order, and it also contains relics of the knights, tapestries, armour, &c. Extensive bagnios under the rock, formerly occupied by the slaves of the knights, are now used for stores. The knights strengthened Valletta and its harbour by bastions, curtain-walls, lines and forts, towards the sea, towards the land and on every available point, taking advantage in every particular of the natural rock and of the marvellous advantages of situation, rendering it then almost impregnable. The work of fortifying the place has been carried on by the British government, which possesses here a naval hospital, military prison and other necessary institutions. Since the British occupation Valletta has been a naval and military station of the first importance. The dock and victualling yards occupy together an area of some 100 acres spread over the shores on both sides of those arms of the great harbour known as "Dockyard" and "French" creeks, the dockyard being partly on the former, but principally on the latter creek. In 1880 the graving dock accommodation consisted of one double dock at the extremity of Dockyard creek, known as Nos. 1 and 2 Docks, with a total length of about 525 ft. and with 25 ft. over the sill at average water-level, the tidal range at Malta being but slight; and opening into French creek a dry dock of more modern construction, known as No. 3, or the Somerset Dock, 427 ft. long on floor, and with 34 ft. over the sill. Subsequently to this period the fine range of buildings known as the iron ship repairing shop was erected close to the Somerset Dock, and added greatly to the repairing resources of the yard. Dock No. 4, or the Hamilton Dock, was completed in 1891, having a length on floor of 520 ft., a width of entrance of 94 ft. and with 35 ft. 5 in. depth over the sill at average water-level. Associated with this dock was the construction of adjacent deep-water wharf walls, together with the great 160-ton crane. Among later additions were gun-mounting stores, boiler shop, boat sheds, canteen, coal stores, &c., together with a double dock 750 ft. long over all, and a single dock 550 ft. long. The large transit trade and the local trade of the island centre upon Valletta. The influx of winter visitors adds to the wealth of the city.

VALLEYFIELD, town and port of entry, Beauharnois county, Quebec, Canada, 25 m. S.W. of Montreal, at the foot of Lake St Francis—an expansion of the river St Lawrence—and at the head of the Beauharnois canal. Pop. (1891) 5515; (1901) 11,055. It is a station on the Canada Atlantic and New York Central railways, and a port of call for all steamers plying between Montreal and Lake Ontario ports. It is the see of a Roman Catholic bishop, and contains a college and a convent. It has extensive cotton, flour, canning and paper mills.

VALLEY FORGE, a small village in Chester county, Pennsylvania, U.S.A., on the S. bank of the Schuylkill river, about 20 m. N.W. of Philadelphia. It is served by the Philadelphia & Reading railway. The village lies in part of the tract occupied in the winter of 1777–1778 by the American army (under General Washington), whose sufferings from cold, starvation and sickness made the place historic. On the 19th of December (after the battles of Brandywine and Germantown and the occupation of Philadelphia by the British) the army, numbering about 10,000, went into camp here, the site having been selected by Washington partly because the hilly ground was favourable for defence, and partly because the army was thus placed between the British forces and York, Pennsylvania (about 65 m. W. of Valley Forge), where Congress was in session. The camp was almost unapproachable from the west by reason of the precipitous hillsides and Valley Creek, a small stream flowing northward at their base into the Schuylkill river which afforded a barrier on the north; on the east a series of intrenchments and rifle-pits were built. In this vicinity the army remained encamped until the middle of June. As a result of the mismanagement and general incapacity of the Commissary Department, the army received little food or clothing during the winter months; in the latter part of December nearly 2900 men were unfit for duty on account of sickness or the lack of clothing, and by the 1st of February this number had increased by nearly 1000, a state of affairs which Washington said was due to "an eternal round of the most stupid mismanagement [by which] the public treasure is expended to no kind of purpose, while the men have been left to perish by inches with cold and nakedness." There were many desertions and occasional symptoms of mutiny, but for the most part the soldiers bore their suffering with heroic fortitude. On the 27th of February Baron Steuben (*q.v.*) reached the camp, where he drilled and reorganized the army. In 1893 the state of Pennsylvania created a commission of ten members, which (with $365,000 appropriated up to 1911) bought about 475 acres (in Chester and Montgomery counties) of the original camp ground, now known as the Valley Forge Park, preserved Washington's headquarters (built in about the year 1758) and other historic buildings, and reproduced several bake-ovens and huts of the kind used by the army. The state has also erected (1908) a fine equestrian statue by Henry K. Bush-Brown to General Anthony Wayne, and a number of granite markers which indicate the situation of the camps of the different brigades. The state of Maine erected in 1907 a granite memorial to the soldiers from Maine who camped here, and in 1910 Massachusetts appropriated $5000 for a memorial to her troops. Valley Forge took its name from an iron forge (also called "Mountjoy forge") built on the east side of Valley Creek, near its mouth, in about 1750, and destroyed by the British in 1777.

VALLOMBROSA, a summer resort of Tuscany, Italy, in the province of Florence, reached by a cable railway 5 m. long from the station of S. Ellero (which is 16 m. S.E. of Florence) and 328 ft. above sea-level, on the N.W. slope of the Prato Magno chain. The former monastery, suppressed in 1816, is occupied by the Royal School of Forestry. A number of hotels have been built. Similar summer resorts are situated among the woods above the Casentino or upper valley of the Arno to the east, such as Camaldoli, Badia di Prataglia, &c. Camaldoli was the original headquarters of the Camaldulensian order, now partly occupied by an hotel. Five hours' journey to the S. of the last on foot and 7½ m. to the E. of Bibbiena by road is the monastery of La Verna, 3660 ft. above sea-level, founded by St Francis in 1215.

VALLOMBROSIANS, an order of monks under the Benedictine rule, founded by St John Gualbert in 1038. He was son of a Florentine nobleman, and became first a Benedictine and then a Camaldulian. Finally, about 1030, he withdrew to Vallombrosa, a shady dale on the side of a mountain in the Apennines, 10 m. from Florence, and for some years led a completely solitary life. Disciples, however, gathered around him, and he formed them into an order in which the cenobitical and the eremitical lives should be combined. The monks lived in a monastery, not in separate huts like the Camaldulians, and the Benedictine rule was the basis of the life; but the contemplative side was strongly emphasized, and every element of Benedictine life was eliminated that could be supposed to interrupt the attention of the mind to God—even manual labour. The Vallombrosians spread in Italy and France, but they never had more than sixty houses. They now have three, with some sixty monks in all. The habit was originally grey, but it became black; and the life also has been assimilated to that of the Benedictines. There were some convents of Vallombrosian nuns.

See Helyot, *Histoire des Ordres religieux* (1718), v. cc. 28, 29; Max Heimbucher, *Orden u. Kongregationen* (1907), I. § 44. (E. C. B.)

VALLS, a town of north-eastern Spain, in the province of Tarragona; 11 m. N. of Tarragona, on the Picamoixons-Roda railway. Pop. (1900) 12,625. Valls is an old town, and its walls and towers still remain. Wool and cotton spinning and weaving, dyeing, distilling, paper-making and tanning are carried on here with considerable activity.

VALOIS, COUNTS AND DUKES OF. The French countship of Valois (*pagus Vadensis*) takes its name from Vez (Latin *Vadum*), its early capital, a town in the department of the Oise. From the 10th to the 12th century it was owned by the counts of Vermandois and of Vexin; but on the death of Eleanor, sister and heiress of Count Raoul V. (d. 1167), it was united to the crown by King Philip Augustus. Soon detached from the royal domain, Valois was the property of Blanche of Castile, widow of Louis VIII., from 1240 to 1252, and of Jean Tristan, a younger son of Louis IX., from 1268 to 1270. In 1285 Philip III. gave the county to his son Charles (d. 1325), whose son and successor, Philip, count of Valois, became king of France as Philip VI. in 1328. Sixteen years later Valois was granted to Philip's son, Philip, duke of Orleans; then passing with the duchy of Orleans in 1392 to Louis (d. 1407), a son of Charles V., it was erected into a duchy in 1406, and remained the property of the dukes of Orleans until Duke Louis became king of France as Louis XII. in 1498, when it was again united with the royal domain.

After this event the duchy of Valois was granted to several ladies of the royal house. Held by Jeanne, countess of Taillebourg (d. 1520), from 1516 to 1517, and by Marie, countess of Vendôme, from 1530 until her death in 1546, it was given to Catherine de Medici, the widow of Henry II., in 1562, and in 1582 to her daughter, Margaret of Valois, the wife of Henry of Navarre. In 1630 Louis XIII. granted Valois to his brother Gaston, duke of Orleans, and the duchy formed part of the lands and titles of the dukes of Orleans from this time until the Revolution.

The house of Valois, a branch of the great Capetian family, is thus descended from Charles, a son of Philip III., and has been divided into several lines, three of which have reigned in France. These are: (1) the direct line, beginning with Philip VI., which reigned from 1328 to 1498; (2) the Orleans branch, descended from Louis, duke of Orleans, a son of Charles V., from 1498 to 1515; (3) the Angoulême branch, descendants of John, another son of the same duke, from 1515 to 1589. Excluding the royal house, the most illustrious of the Valois branches are: the dukes of Alençon, descendants of Charles, a younger son of Charles I., count of Valois; the dukes of Anjou, descendants of Louis, the second son of King John II.; and the dukes of Burgundy, descendants of Philip, the fourth son of the same king.

VALOIS, HENRI DE [Valesius] (1603–1676), French scholar, was born at Paris on the 10th of September 1603. He was a pupil of the Jesuits at the college of Clermont, then studied law at Bourges. He was called to the bar in 1623, but before long devoted himself entirely to literature. He had an extraordinary memory and a thorough knowledge of the classics, and to him we owe editions of several of the Greek historians, with excellent Latin translations, the only fault found with which is that they are too elegant: *Polybii, Diodori Siculi, Nicolai Damasceni, Dionysii Halicarnassii, Appiani et Joannis Antiocheni excerpta* (1634; Henri de Valois used for this edition a manuscript coming from Cyprus, which had been acquired by Peiresc); *Ammiani Marcellini rerum gestarum libri 18* (1636); *Eusebii ecclesiastica historia, et vita imperatoris Constantini, graece et latine* (1659); *Socratis, Sozomeni, Theodoreti et Evagrii Historia ecclesiastica* (1668–1673). When almost sixty years of age, and nearly blind, he married Marguerite Chesneau (1664), and had by her four sons and three daughters. He died in Paris on the 7th of May 1676.

His brother, Adrien de Valois (1607–1692), was also a well-known scholar. He made the acquaintance of Father Petau, Father Sirmond and the brothers Dupuy, who turned his attention towards medieval studies. He was appointed historiographer in 1660. He undertook the task of writing a critical history of France, but did not get further than the deposition of Childeric III. (752). He devoted, however, to this period three folio volumes (*Gesta Francorum seu rerum francicarum tomi tres*, 1646–1658), which form a critical commentary of much value, and in many points new, on the chroniclers of the Merovingian age. His study on the palaces constructed by the Merovingian kings (*De basilicis quas primi Francorum reges condiderunt*, 1658–1660) is noteworthy in this connexion. In 1675 appeared his *Notitia Galliarum ordine litterarum digesta*, a work of the highest merit, which laid the foundations of the scientific study of historical geography in France; but, like all the scholars of his age, he had no solid knowledge of philology. His last work was a life of his elder brother (*De Vita Henrici Valesii*, 1677).

Adrien's son, Charles de Valois (1671–1747), was a distinguished numismatist, and formed a fine collection of medals, chiefly Roman. He entered at an early age the *Académie des Inscriptions et Belles Lettres*, where he became first a pupil (1705), then an associate (1714) and finally a *pensionnaire* (1722). He published little; we know, however, an *Histoire des Amphictyons* by him. His best work, the *Valesiana* (1694), was inspired by filial affection; in it he collected a number of historical and critical observations, anecdotes and Latin poems of his father. His *Éloge*, by Fréret, is in the *Mémoires de l'Académie des Inscriptions*, vol. xxi. p. 234 (1747).

VALPARAISO, a province of Chile on the Pacific coast, bounded N. by Aconcagua, E. and S. by Santiago and W. by the ocean. Area, 1953 sq. m. Pop. (1895) 220,756; (1902, estimated) 249,885. Its surface is chiefly mountainous, and in great part barren. The river and mountain valleys, however, are fertile, and where irrigation is possible yield large crops, especially cereals. The valley of the Aconcagua, which flows across the N. end of the province, is celebrated for its fertility, especially in the vicinity of Quillota, sometimes called the "garden of Chile." The capital is Valparaiso, and the principal town outside the capital is Quillota.

VALPARAISO, a city and seaport of Chile, capital of the province of Valparaiso, on a broad open bay of the Pacific in lat. 33° 0′ 2″ S., long. 71° 41′ 15″ W., about 70 m. N.W. of Santiago. Pop. (1902) 142,282; (1907, estimated) 180,600. The almost semicircular Bay of Valparaiso is slightly over 3 m. across from Punta Angeles to Punta Gruesa, and the city stands on the south side, on the slopes of a spur of barren hills projecting into the Pacific and forming a rocky peninsula terminating in Punta Angeles. This point affords good shelter from southerly and westerly storms, but the bay is open to those from the north. The city occupies a narrow strip of beach extending around the head of the bay, and extends up the steep slopes and valleys of the enclosing hills, which have an altitude of 1000 to 1400 ft. The extreme outer points of the bay are strongly fortified. Valparaiso is pre-eminently a commercial city. The foreign trade is largely in the hands of foreign merchants. Among industrial establishments are the government railway shops, large foundry and machine shops, coach-building works, a large sugar refinery, breweries, distilleries, bottling works and numerous small factories. The trade of the port, which is the largest and most important on the Pacific coast of South America, makes it a terminal and port of call for several regular lines of steamers, which afford frequent communication with Europe and the United States. The transcontinental railway line between Valparaiso and Buenos Aires (the Andean tunnel was opened in April 1910) adds to the traffic of the port, through the transhipment of passengers and freight to escape the long and dangerous voyage by way of the Straits of Magellan. Two cable lines give telegraphic communication with Europe and the United States—a West Coast line running N. to Panama, and a land line across the Andes to Buenos Aires in connexion with the cable to Europe from that port. There is but one railway out of Valparaiso—the government line to Santiago, with a branch running to Los Andes and the international tunnel through the Andes. There are a wireless telegraph station in regular communication with the islands of Juan Fernandez, state telegraph lines communicating with all parts of the republic, and an efficient telephone service. Valparaiso has an attractive suburb, Viña-del-Mar, immediately E. of Punta Gruesa, only 15 minutes by rail from the city.

Valparaiso was founded in 1536 by Juan de Saavedra, who named it after his birthplace near Cuenca, Spain. It was an ill-chosen name, however, for there is nothing in it descriptive of the barren hills, dirty streets and foul-smelling shores of Valparaiso (Paradise Valley). The port and town were of but little note during the colonial period, for free commercial intercourse with the colony was forbidden. In 1819, near the end of the war with Spain, its population barely reached 5000. In 1578 it was captured by Sir Francis Drake, and in 1596 by Sir John Hawkins. In 1600 it was sacked by the Dutch under Van Noort. On the 31st of March 1866, it was bombarded by a Spanish fleet under the command of Admiral Nunez, when a large part of the town was laid in ruins, and on the 28th of August 1891, after the victory of the congressional troops over Balmaceda's forces in the vicinity, it was partially sacked by the Chileans themselves. Valparaiso has suffered much from earthquakes—in 1730, 1822, 1839, 1873 and 1908. The last-mentioned caused the destruction of a large part of the city, including public edifices, private residences, the water mains, public lighting service and transportation facilities. A large part of the population was deprived of shelter and had to take refuge on the plateau above. Aid was promptly given by the national government, and assistance was sent from foreign countries; and the national government made a grant for the rebuilding of the city.

VALPARAISO, a city and the county-seat of Porter county, Indiana, U.S.A., about 40 m. S.E. of Chicago. Pop. (1890) 5090; (1900) 6280, including 660 foreign-born; (1910) 6987. It is served by the Grand Trunk, the New York, Chicago & St Louis, and the Pennsylvania railways. The city has a public library (1905), and is the seat of an Institute of Telegraphy (founded in 1874; chartered in 1900) and of Valparaiso University (1873; formerly known as the Valparaiso Normal Training School). This university was founded to furnish a practical education at a low cost, and in 1910 had 187 instructors and a total enrolment of 5367 students. Valparaiso was settled about 1835, incorporated in 1856 as a village and chartered as a city in 1865.

VALPY, RICHARD (1754–1836), English schoolmaster, was born in Jersey on the 7th of December 1754. He was sent to schools in Normady and Southampton, and completed his education at Pembroke College, Oxford. In 1777 he took orders, and in 1781 became head master of Reading grammar school, a post which he held for fifty years. He was the author of Greek and Latin grammars which enjoyed a large circulation. He died in London on the 28th of March 1836.

His second son, Abraham John Valpy (1787–1854), printer and publisher, is remembered in connexion with two great undertakings in the department of classical literature. These were reissues of (1) Stephanus's Greek *Thesaurus*, for which E. H. Barker was chiefly responsible; (2) the Delphin Classics in 143 volumes with *variorum* notes, under the editorial superintendence of George Dyer. He also founded the *Classical Journal* in 1810.

VALS (Vals-les-Bains), a village of south-western France, in the department of Ardèche, 3 m. N.N.W. of Aubenas, with which it communicates by tramway. Pop. (1906) town, 2694; commune, 4352. Vals is situated on the Volane amongst volcanic mountains. It is celebrated for its numerous cold mineral springs impregnated in most cases with bicarbonate of soda. They are used chiefly for drinking but also as baths, and are efficacious in maladies of the digestion, liver and kidneys, and for gravel and gout. Seven or eight million bottles annually are exported. Wood-turning and silk-milling are carried on.

VALTELLINA (Ger. *Veltlin*; the name comes from the former capital, Teglio, near Tresenda), properly the name of the upper valley of Adda, in north Italy. Historically and officially, it also comprises the Italian Liro or San Giacomo valley, which extends from the Splügen Pass past Chiavenna (where the Liro is absorbed by the Mera, flowing from the Swiss Val Bregaglia) to the Lake of Como, the Mera entering this lake slightly to the north of the Adda. These two valleys (but not Colico, which is in the province of Como) form together the province of Sondrio. Pop. 145,265 (exclusive of Colico) or 122,466 (omitting Chiavenna). Politically the whole valley belongs to the kingdom of Italy, except the side valley of Poschiavo (Puschlav), which belongs to the Swiss canton of the Grisons (Graubünden). The chief town is Sondrio (7172), other important places being Tirano (5870), Chiavenna (4592) and Morbegno (3603). Near Bormio (Ger. *Worms*) there are some frequented mineral springs (sulphur and lime), known in Pliny's time, and efficacious in diseases of the skin. There are several other baths in the side valleys, such as Santa Caterina (chalybeate), Masino and Le Prese (sulphur).

The highest points in the ranges enclosing the valley are the Piz Zupo (13,131 ft.) in the Bernina group and the Königsspitze (12,655 ft.) in the Ortler district; the Monte della Disgrazia (12,067 ft.) is the highest peak comprised entirely within the water-basin of the valley. Four well-marked Alpine passes are traversed by good carriage-roads—the Stelvio Pass or Stilfserjoch (9055 ft., the highest carriage-road in Europe) from Bormio to Meran in the Adige valley, the Bernina Pass (7645 ft.) from Tirano to Samaden in the Upper Engadine, and the Aprica Pass (3875 ft.) from Tirano to the Val Camonica and the Lake of Iseo, while from near the top of the Stelvio a fourth road leads over the Umbrail Pass (8242 ft., the highest in Switzerland) to the Swiss valley of Münster, which is reached at the village of Santa Maria. The main valley is traversed from end to end by a magnificent carriage-road constructed by the Austrian Government in 1820–1825. A railway runs from Colico, on the Lake of Como, past Sondrio to Tirano, a distance of 42 m., while there is another from Colico to Chiavenna (16¾ m.).

The population is wholly Italian-speaking and Roman Catholic, the valley being in the diocese of Como. The shrine of the Madonna of Tirano (founded 1520) annually attracts a large number of pilgrims. The valley, particularly in its lower portion, is extremely fertile; and of late years vigorous measures have been taken to prevent the damage caused by the frequent inundations of the Adda. Chestnuts, vines, mulberry trees and fig trees abound; and there are many picturesquely situated churches, castles and villages. The chief articles exported are wine and honey. The wine is largely consumed in north Italy and Switzerland, the best varieties being Grumello, Sassella and Montagna. Large quantities of honey are annually sent abroad.

History.—The political history of Valtellina is made up of the histories of three districts—(1) the "free community" of Poschiavo (first mentioned as such in 1200–1201); (2) the county of Bormio (first mentioned as a county in 1347); and (3) Valtellina proper, extending from the defile of the Serra di Morignone on the east to the Lake of Como on the west. After the defeat of the Lombards (774) these three districts were given (775) by Charlemagne to the abbey of St Denis near Paris, which never seems to have exercised its rights. In 824 Lothair I., confirming an earlier donation (803) made by Charlemagne, gave the churches of Poschiavo and Bormio to the bishop of Como. Bormio was in 1205 won by the men of Como, who in 1006 had received one-half of Valtellina from the emperor, and by 1114 they were masters of the entire valley. They retained Bormio till 1300, when it freed itself; but in 1336 it belonged to the bishop of Chur. In 1335 the Visconti, lords (later dukes) of Milan, became lords of Como, and therefore of Valtellina. In 1350 they seized on Bormio and Poschiavo, the latter being won back by the bishop of Chur in 1394 and again lost to the Visconti in 1470. As early as 1360 the men of Rhaetia made incursions into Valtellina under the pretext that it had formed part of ancient Rhaetia. This idea was confirmed in 1404, when, in return for kind treatment received during his exile, Mastino Visconti (son of Barnabò) gave to the bishop of Chur his share of the Milanese, including Poschiavo, Bormio and Valtellina. Relying on this donation, the men of the Three Leagues of Rhaetia (best known by the name of one, Graubünden) invaded the valley in 1486–1487, Poschiavo becoming in 1486 permanently a member (not a subject land) of the *Gotteshausbund*. This donation served too as the excuse for seizing, in 1512, on Chiavenna, Bormio and Valtellina, which were harshly ruled as "subject bailiwicks." Under the governor at Sondrio there were four "podestas" for the three divisions of Valtellina (Morbegno and Traona, Sondrio and Tirano), besides one at Teglio and one at Bormio. Mastino Visconti's donation was solemnly confirmed in 1516 by the emperor Maximilian I. In 1530 the bishop of Chur was forced to sell to the Three Leagues for a small sum his title to these two districts. At the time of the Reformation Poschiavo became Protestant. The other two districts clung to the old faith and came under the influence of Carlo Borromeo, who, when founding in 1579 his "Collegium Helveticum" at Milan for Swiss students for the priesthood, reserved for Valtellina six out of the forty-two places. Valtellina was extremely important to the Habsburgs as affording the direct route between their possessions of the Milanese and Tirol. Hence a great struggle, into which religious questions and bribery largely entered, took place between Austria and Spain on one side and France and Venice on the other. In 1603 Fuentes, the Spanish governor of the Milanese, built a fortress (of which traces still remain) close to the Lake of Como, and at the entrance to the valley, in order to overawe it. The religious conflicts in Graubünden led to reprisals in the "subject land" of Valtellina. In 1620 (19th July–4th August) the Spanish and Romanist faction (headed by the Planta family) massacred a great number of Protestants in the valley, 350 to 600 according to different accounts (*Veltliner Mord*). For the next twenty years the valley was the scene of great strife, being held by the Spaniards (1621–23, 1629–31, 1637–39), by the French (1624–27, 1635–37), and by the pope (1623, 1627). At length George Jenatsch, a former pastor, who had been the active and unscrupulous leader of the Protestant party, became a Romanist (1635) in order to free the land from the French by aid of the Spaniards (1637), who finally (1639) gave it back to its old masters on condition that the Protestants were excluded from the valley. In this way the local struggles of Valtellina came to be mixed up with the Thirty Years' War. In 1797 Bormio and Valtellina were annexed to the Cisalpine republic, in 1805 to the kingdom of Italy (of which Napoleon was king), and in 1815 (despite the remonstrances of the Raetian leagues) to the kingdom of Lombardo-Venetia, held by the emperor of Austria. In 1859 they became, like the rest of Lombardy, part of the kingdom of united Italy. Poschiavo followed the fortunes of the "Gotteshausbund." It became (after 1798) part of the canton Raetia of the Helvetic republic, and in 1803 of the canton of the Graubünden or Grisons, which was then first received a full member of the Swiss Confederation.

VALUATION AND VALUERS. A valuation of property may be required in view of a proposed sale or purchase, or in order to ascertain the amount for which it will constitute a sufficient security if mortgaged, or which should be paid by way of compensation where it is compulsorily taken or wrongfully damaged. It may also be necessary with a view to the assessment of property for rating, or for fiscal or other purposes. Where it is desired to ascertain the amount which may properly be invested in the purchase of land or buildings, the valuer will consider their character and situation, and the greater or less degree of risk incidental to their nature, in order to determine the rate of interest which they ought to yield. The valuation will proceed upon the basis that the property should return to the purchaser the capital which he invests together with interest at the rate so settled, or afford him security for such interest while he keeps the property and the return of the capital when he desires to realize it. Accordingly, the net rent which it may be expected to yield must be ascertained by deducting the known and estimated outgoings and any other allowances which have to be taken into consideration from the gross amount which a knowledge of the local circumstances indicates as the probable return. Where the property is leasehold held for a term of fixed duration, the number of years' purchase will depend upon the length of the unexpired portion of the term, and can be ascertained without special calculation by reference to a table in common use. If the duration of the term or other interest in the property is uncertain, as, for example, in the case of a lease for lives, the number of years' purchase which may fairly be taken will be found in some other of the tables (*e.g.* Inwood's or Willich's), which have been prepared to meet the different classes of cases with which valuers have to deal. If the property is freehold the number of years' purchase can be found by dividing one hundred by the rate of the interest required.

A valuation or appraisement, under English law, need not be stamped where it is made (1) for, and for the information of, one party only, and is not obligatory as between parties; (2) in pursuance of the order of a court of admiralty or on appeal therefrom; (3) of property of a deceased person for the information of an executor, or other person required to deliver an affidavit of the estate of such deceased person; or (4) of any property for the purpose of ascertaining the legacy or succession or account duty payable in respect thereof. Any other valuation or appraisement, whether of property or any interest therein or of the annual value thereof, or of any dilapidations or of any repairs wanted or of the materials and labour used, or to be used, in any building or of any artificer's work, must be stamped. An appraiser who makes an appraisement or valuation chargeable with stamp duty must, within fourteen days after making it, write it out in words and figures showing the full amount thereof upon duly stamped material. If he omits to do so, or in any other manner discloses the amount, he becomes liable to a fine of £50. Any person who receives from an appraiser, or pays for the making of, any such appraisement or valuation not so written out and stamped, becomes liable to a fine of £20.

Where a contract has been made for the sale of property at a valuation, a valuation made in accordance with its terms will be conclusive as between the parties, in the absence of fraud, collusion or mistake. Where there has been an agreement to sell goods on the terms that the price is to be fixed by the valuation of a third party and such third party cannot or does not make such valuation, the agreement is avoided; but if the goods or any part thereof have been delivered to and appropriated by the buyer he must pay a reasonable price therefor. Where the third party is prevented from making the valuation by the fault of the seller or buyer, the party not in fault may maintain an action for damages against the party in fault. Where the fixing of a value by valuers is not of the essence of an agreement, but is wholly subsidiary to it, the courts will, if justice require it, ascertain the value in order to carry the agreement into effect. Where an agreement had been entered into for the sale of a house at a fixed price and of the fixtures and furniture therein at a valuation by a person named by both parties, and he undertook the valuation but was refused permission by the vendor to enter the premises for that purpose, the vendor was ordered to allow the entry so that the valuation might proceed.

A person who exercises the calling of an appraiser or who, for or in expectation of any fee or reward makes any valuation or appraisement chargeable with stamp duty, must (unless he is licensed as an auctioneer or house agent) have an appraiser's licence, upon which a duty of £2 is charged and which continues in force from the day of its date until the following 5th of July. By default in this respect a liability to a penalty of £50 is incurred. Moreover, an unlicensed appraiser cannot recover remuneration. A valuer is liable to the person who has employed him for the consequences of negligence or want of due care and skill on his part. If his services are thereby rendered worthless he will not be able to recover anything by way of remuneration. A valuation of a house taken by a railway company made by a surveyor who did not enter the house was held not to be a proper valuation. Although a valuer cannot be expected to possess a minute and accurate knowledge of the law, he ought to be acquainted with the general principles applicable to the valuations which he undertakes so far as is necessary in order to enable him to make them properly. The valuer, however, will be liable for the consequences of his negligence only towards the person who employed him, and not to any one else who may happen in fact to have been prejudiced thereby. (H. Ha.)

VALUE (O. Fr. *value*, from *valoir*, to be worth, Lat. *valere*), in general usage a term signifying worth. It has, however, a special meaning in economics, which is the subject of this article.

In some departments of economic theory it is still convenient to use as the basis of the exposition the opinions of J. S. Mill, because he embodied in his treatise on Political Economy in a remarkable manner nearly everything of importance from the theoretical standpoint in the work of his predecessors, and to a considerable extent subsequent advances in economic science have been made by way of criticism or development of his version. This observation is especially true of the theory of value. In this subject Mill had digested the mass of previous learning with such effect that he commences his treatment with the remark: "Happily there is nothing in the laws of value which remains for the present or any future writer to clear up; the theory of the subject is complete. The only difficulty to be overcome is that of so stating it as to solve by anticipation the chief perplexities which occur in applying it." Curiously enough this part of economic theory was the first to receive at the hands of Jevons and others serious modification, the nature and need for which can, however, only be properly understood after a preliminary examination of the old orthodox position.

As regards the question of definition, Mill starts with the distinction somewhat loosely drawn by Adam Smith between value in use and value in exchange. When we say that a thing possesses a certain value in use, we say in more words than are necessary that it is useful: that is to say, value in use is an awkward phrase for utility. The conception of utility (see WEALTH) is the most fundamental in economics. It is held by Mill to mean the capacity to satisfy a desire or serve a purpose, and thus "useful," the corresponding adjective, is as fitly applied to ices as to steam-engines. It has always seemed rather paradoxical to apply the term utility (with its adjective useful) to things which the common sense of mankind (or of any representative section) considers to be deleterious or trivial. Accordingly V. Pareto has proposed the term *ophélimité* (Gr. ὠφέλιμος) for this wider interpretation of "utility." But utility in this sense is obviously much wider than value, and Mill proceeds to say that by value in political economy we should always understand exchange value. This language seems familiar and definite, but on analysis it is clear that exchange implies two terms at least. If we say that a thing can be exchanged, we imply that it can be exchanged for something else, and when we speak of the exchange value of a thing we must directly or indirectly refer to the value of some other thing or things. In practice in modern societies this other thing is standard money: an Englishman who talks of the exchange value of anything means the number of pounds sterling (or parts thereof) which it will fetch in the market or be appraised at by a fair arbitrator. On this view then the value of a thing is its price; but a very little experience in the theory or history of economics will show that it is often desirable, and sometimes necessary, to contrast value with price. "At the same time and place," says Adam Smith, "money is the exact measure of the real exchangeable value of all commodities. It is so, however, at the same time and place only." If, however, the exchange value of a thing is not its price, what is it? According to Mill, "The value of a thing is its general power of purchasing, the command which its possession gives over purchasable commodities in general." But what, we may well ask with Mill, is meant by command over commodities in general? Are we to understand the complete national inventory of wealth, or the total of things consumed in a given time by a nation? Obviously such conceptions are extremely vague and possibly unworkable. If, however, we make a selection on any representative principle, this selection will be more or less arbitrary.

The elaborate work of C. M. Walsh on the *Measurement of General Exchange Value* (1901) gives a critical analysis of the views of the chief writers on the subject and indicates the advances made since Mill. Mill is to some extent aware of the difficulties, although he never subjected them to a rigorous analysis; and he points to the obvious fact that a coat, for example, may exchange for less bread this year than last, but for more glass or iron, and so on through the whole range of commodities it may obtain more of some and less of others. But in this case are we to say that the value of the coat has risen or fallen? On what principles are we to strike an average? The attempt to answer these questions in a satisfactory manner is at present engaging the attention of economists more than any other problem in the pure theory. Mill, however, instead of attempting to solve the problem, frankly assumed that it is impossible to say except in one simple case. If, owing to some improvement in manufacture, the coat exchanges for less of all other things, we should certainly say that its value had fallen. This line of argument leads to the position: "The idea of general exchange value originates in the fact that there really are causes which tend to alter the value of a thing in exchange for things generally, that is, for all things that are not themselves acted upon by causes of similar tendency." There can be no doubt as to the truth of the latter part of this statement, especially if we substitute for one commodity groups of commodities. But it is doubtful if the idea of general exchange value arises from a consideration of the causes of value; and later writers have constantly emphasized the distinction between any change and the causes of the change. Following out the idea in the last sentence quoted, Mill goes on to say that any change in the value of one thing compared with things in general may be due either to causes affecting the one thing or the large group of all other things, and that in order to investigate the former it is convenient to assume that all commodities but the one in question remain invariable in their relative values. On this assumption any one of them may be taken as representing all the rest, and thus the money value of the thing will represent its general purchasing power. That is to say, if for the sake of simplicity we assume that the prices of all other things remain constant, but that one thing falls or rises in price, the fall or rise in price in this thing will indicate the extent of the change in its value compared with things in general. There can be no doubt that, in discussing any practical problem as to the changes in the relative value of any particular thing, it is desirable to take the changes in price as the basis, and much confusion and cumbrousness of expression would have been avoided in the theory of the subject if, to adapt a phrase of Cournot's, money had by Mill and others been used to oil the wheels of thought, just as in practice it is used to oil the wheels of trade.

By this method of abstraction the treatment of the theory of value becomes essentially an examination of the causes which determine the values of particular commodities relatively to a standard which is assumed to be fixed. Cournot compares this hypothetical point of the standard of value to the "mean sun" of astronomers. In order that anything may possess value in this sense, that it

Requisites for value.

may exchange for any portion of standard money or its representatives, it is evident on the first analysis that two conditions must be satisfied. First, the thing must have some utility; and secondly, there must be some difficulty in its attainment. As regards utility, Mill apparently regards it simply as a kind of entrance examination which every commodity must pass to enter the list of valuables, whilst the place in the list is determined by variations in the degree of the difficulty of attainment. Later writers, however, have given much more prominence to utility, and have drawn a careful distinction between final or marginal and total utility. Following Jevons, most economists have adopted this distinction, and the writers of the Austrian school in particular have made it of vital importance, and by attempting to introduce it when the conception is inappropriate have often caused much unnecessary complexity. The distinction is certainly useful in throwing light on the advantages of, and motives for, exchanging commodities. Suppose that on a desert island A possesses all the food, so many measures—(say) pecks—of corn, and B all the drinking water, so many measures—(say) pints. Then A, taking into account present and future needs, might ascribe to the possession of each portion of his stock so much utility. The utility of the first few pecks of corn might be regarded as practically infinite; but, if his stock were abundant, and a speedy rescue probable, the utility ascribed to successive portions would be less and less. In the same way B might make an estimate of the utility of successive measures of the drinking water. Now, if we regard only *total* utilities from the point of view of each, both are infinite. If an exchange were made of the total stocks of both men, the position of neither would be improved. But, if A sets aside (say) half his stock, then it may well happen that he could advantageously exchange the rest against part of B's drinking water. In precisely the same way B might set aside so much of his stock for his own consumption, and then the utility of the remaining portion would be much less than the utility he would gain if he obtained in exchange A's surplus. Thus, if the two men exchange their remainders, both will gain in utility; in the case supposed they will make an enormous gain. For simplicity we have supposed each stock to be divided into two portions, but nothing has been said of the principles of the division. It is, however, clear that A can advantageously go on exchanging a measure of corn for a measure of water so long as by doing so he makes a gain of utility. Conversely B can advantageously offer water so long as he gains greater utility from the corn received in exchange. The utility of the last portion of corn retained by A (or of water by B) is the *final* or marginal utility of the stock retained, and similarly the utility of the last measure obtained in exchange may be called the final utility of the stock purchased. A will have done his best if these utilities are just equal. For at this point, if he were to offer (at the same rate of exchange) more corn, it is clear that he would lose more utility than he would gain. *Mutatis mutandis*, the same reasoning applies to B; and thus the rate of exchange will be so adjusted as to bring about this equality of marginal utilities on both sides. It follows that, if A gains on the last portion received just as much utility as he loses on the portion parted with, on all the other portions received he will have gained more than he lost. The total of these gains over successive portions has been called by Professor Marshall *consumer's rent* or surplus.

Final or marginal and total utility.

However useful this theory of marginal utility may be in throwing light on the fundamental nature of value, and on the advantages of exchange, it is obviously too abstract to be applied to the explanation of the relative values of the endless series of commodities and services which constitute a nation's stock of valuables at any time. For this purpose we must resort to the law of supply and demand, which requires a very careful statement owing to the ambiguities of popular language. Mill has succeeded in getting rid of most of these ambiguities, but he has hardly given due emphasis to the fundamental character of the law. He argues, after the brief consideration allotted to the element of utility, that the other preliminary condition necessary for value—

Difficulty of attainment.

difficulty of attainment—is not always the same kind of difficulty, and he arrives at three distinct laws of value, according to three forms or degrees of this difficulty. (1) In the first place, the difficulty may consist in an absolute limitation of the supply, and in this case the corresponding law is said to be the law of supply and demand. Even on Mill's view the class of commodities which comes under this heading is both large and important, for it includes not only the favourite examples of old pictures, china, &c., but also land, and especially building sites in large cities. Again, it is pointed out that, although comparatively few commodities may be absolutely limited, almost all commodities may be so locally and temporarily, which is really only another way of saying that the law of supply and demand governs all market values; for it is obvious that the supply actually forthcoming or obtainable in a specified time in any market is limited—a point which may be well illustrated by the extreme case of a "corner." Again, under certain circumstances the supply may be artificially limited, as in the case of monopolies, the classical example being the destruction by the Dutch of some of their spice, in order that the limited quantity might sell for a total higher price. Besides all these important instances of the operation of the law of supply and demand, Mill is compelled also to bring under the same law the wages of labour, the values of the staples of international trade, and some other peculiar cases of value. In fact, step by step he is almost forced to the conclusion, now generally accepted, that the law of supply and demand is the fundamental law of value, of which the other laws are only particular cases. At the outset, however, he appears to consider the two others as of co-ordinate importance. (2) When the difficulty of attainment consists not in the absolute limitation but simply in the fact that the article requires labour and capital to produce it, the normal or natural value is said to be determined by the cost of production. (3) In the last case taken by Mill it is supposed that an article can be increased in quantity, but only at an increasing cost, and in this case the corresponding law of value is the cost of production of that portion which is obtained under the most unfavourable circumstances. These three laws of value may now be examined critically and their mutual relations discussed, for the last two, if not properly of co-ordinate importance with the first, are at any rate wide generalizations.

Three laws of value.

In order to understand the law of supply and demand, it is best to take separately the general law of demand and the general law of supply, and then effect a combination. Demand must be defined as the quantity of any article demanded at some particular price, it being assumed of course that the bidder of the price can meet his engagements, or, as is sometimes said, that the demand is an effectual demand. It is quite clear that by demand we cannot simply mean desire to possess, because in a sense every one desires everything, and the less the means of payment so much greater in general is the desire. Again, it is obviously necessary to insert the qualifying clause "at some particular price," because, as a rule, with a change in price a different quantity will be demanded. It is, indeed, this variation of quantity demanded, according to variation in price, which gives rise to the statement of the general law of demand, namely: As the price of any article falls, other things remaining the same, the quantity demanded increases, and, conversely, as the price rises the quantity demanded decreases. A very good example of this law is found in the effects of the remission of taxes. The repeal of a tax leads to a fall in price, and the fall in price is accompanied by increased consumption. Conversely, it has often been found that to increase the amount of a tax does not increase the revenue from it, because the demand for the article falls off. The general law of demand is best expressed as by Cournot by saying that the quantity demanded is a function of the price. If we suppose that corresponding to the smallest change in price there is a change in the quantity demanded the law of demand may be illustrated by curves. Marshall has introduced the idea of demand schedules, the quantities demanded being written in one column and the corresponding prices in another. The precise connexion between the price and the quantity demanded differs in different cases, and, strictly speaking, is probably never the same for any two commodities. Every commodity has its own curve or schedule. At the same time, however, commodities may be placed in large classes according to the general character of the variation. The variation of quantity demanded according to price will ultimately rest on the principle of *marginal utility* explained above. A person with a limited amount of money to spend will hit the economic mark in the centre if the final utilities of his several purchases are equal. This is a rather technical way of saying that a prudent man will not spend a penny more on any particular thing if the penny spent upon some new object would give him a little greater satisfaction. Reverting to the variations of demand according to price, a contrast will at once be observed between necessaries and luxuries. However much the price rises, so long as people have the means they must consume a certain amount of necessaries, but, however much the price falls, the limit of consumption of bread, for example, must soon be reached. On the other hand, a great fall in price of many luxuries may cause an enormous increase in the demand, whilst a great rise may almost destroy the demand. The rate of charge—the quantity demanded according to the changes in price—is referred to as *elasticity* of demand. If for a small change in price there is a considerable increase in the quantity demanded, the demand is said to be very *elastic*. Other characteristics of demand are indicated by the terms direct, derived, compounded, &c., the demand for any one thing being obviously affected by the possible use of substitutes on the one side and on the other by the emergence of other uses. Recent writers, notably Marshall, have given much attention to the development of the law of demand in its various aspects, which has been too much neglected in the Ricardian analysis followed by Mill. A great deal of light might be thrown on many interesting problems in the progress of a nation and of its various component classes, if the laws of demand, or the statistics of consumption according to price, were obtainable.

Supply and demand.

Law of demand.

Turning to the element of supply, this term in a similar way may be defined as the quantity offered for sale at some particular price, and the general law of supply may be stated thus: As the price rises, other things remaining the same, the quantity offered tends to increase, and, conversely, as the price falls the quantity offered tends to diminish. Expressed in this manner, supply appears to be exactly analogous to demand, and the analogy seems to hold good even when we push the analysis up to the utility to the seller as compared with the utility to the buyer. For, as the price rises, the seller will obtain greater utility, and will thus retain less for his own use or will be induced to produce more. On closer inspection, however, the law of supply is found to be not so simple as the law of demand. It would only be so if the seller had simply to compare the relative advantages of exchanging his commodity and of retaining it for his own use, without any further reference to the conditions of, or the motives for, production. In most commodities, however, the determining influence is not the comparative utility of consumption by the owner on the one hand or of the consumption of something else obtained by exchange on the other, but it is rather a comparison of the trouble of producing with the advantage of selling the article when produced. Of course, if we are considering finished products in any market the case is more simple; but even here the question of the relative advantages of present sale and reservation for a future market or distant place must be determined, and then the element of cost of production will again be brought back. The law of supply may be developed on lines corresponding to the law of demand, and we may construct supply schedules on curves indicating the relations between the range of prices and the quantities offered at those prices.

Law of supply.

Before considering the relation of cost of production to supply, it will be convenient to combine the laws of supply and demand, taking the former in its simplest aspect, and to state the general law of supply and demand as governing value. Excluding the simple case of the barter of two commodities of which the rate of exchange will be determined as explained above in reference to marginal utility, and meaning by demand the quantity demanded in a market at a certain price, and by supply the quantity there and then offered at a certain price, the general law may be stated thus: In any market the price of any article will be so adjusted that the quantity demanded will exactly equal the quantity offered at that price. The force by which the adjustment is made is, in general, competition. Thus, if the price were above the point indicated by the law, there would be a lessened demand, and the competition of sellers would tend to lower the price. Conversely, if the price were lower the competition caused by the increased demand would tend to raise it. The law as thus stated corresponds to what Mill calls the equation between demand and supply. He was induced to adopt this phrase in place of the more popular expression, the ratio of demand to supply, on the ground of its greater accuracy. And, if the term ratio is to be taken strictly, no doubt Mill's criticism is perfectly just. At the same time the equation must be stated very carefully to avoid falling into the truism suggested by Cairnes, namely, that in any market the quantity bought at any price is equal to the quantity sold at that price. The point is that in accordance with the general principles of supply and demand the quantities offered and demanded vary with the price. And, however inaccurate the literal use of the term ratio may be, it has the advantage of suggesting a change of price according to changes in demand and supply. The equilibrium between demand and supply was illustrated by Cournot by the intersection of the demand and supply curves, and for purposes of theory this mathematical method offers great advantages.

Equation between demand and supply.

It may be useful at this point to consider the principles by which monopoly values are regulated. The simplest case is when one individual possesses the whole stock, and the cost of production is so small that it may be neglected. Take the case, for example, of some natural well having a unique character for the mineral waters it supplies. The monopolist will, in the first place, have to discover the law of demand for his article. If he fixes a very high price, he may only occasionally sell a pint to a king or a millionaire; whilst, if he fixes a very low price, he may sell to every peasant and yet get a very poor return. He will, in fact, have to work out a problem in mathematics, and must so adjust his price that the quantity sold multiplied by the price per unit will be a maximum. The same kind of difficulty is found in the case in which the expenses of production, although considerable, are practically fixed or only increase slightly in proportion to the quantity furnished. The minimum price will be given by the expenses of production, whilst the actual price will tend to be such as to yield the maximum profit. Take, for example, the case of a steamer which has a practical monopoly and is not controlled by government. The owner will not send out the steamer at all unless the passengers and cargo pay the expenses; but, if there is a great demand, he will raise the price so as to secure a maximum profit. In general, however, any increase in the quantity of the article produced (or the service rendered) will be accompanied by an increase in the necessary outlays, and this increase may be greater or less per unit. In these cases the calculation of the maximum profit is a matter of great difficulty. Take, for example, the case of a railway which has a monopoly in a certain tract of country. The manager may aim at keeping down expenses and charging high rates, being contented with a moderate traffic; or he may lower his charges and incur additional expense to increase the gross income. It is worthy of remark that in many cases the monopolist has a choice of two methods which give practically equally good results, one starting with low and the other with high prices. But it is clear that the mass of the general public or the great body of consumers have an interest in low prices being adopted, whilst, on the other hand, the tendency is usually for the monopolist to charge higher prices than are really profitable in a maximum degree. The simplicity of the method of high prices is always attractive and often deceptive. Accordingly, even on these very general grounds, the interference of government with monopolies may sometimes be defended as being in the interests of the public and not against the interests of the monopolists. The case of the parliamentary third-class tickets furnishes an instructive example. At first the railways made their parliamentary trains as slow and inconvenient as possible, whereas now there is hardly a train which does not carry passengers at parliamentary rates without compulsion. As a rule, however, in modern commercial countries legal monopolies are an exception. Any one, for example, can prosecute any trade or manufacture if he can provide the requisite skill, labour and capital; and even as regards land—at any rate in the greater part of England and Scotland—there is from the point of view of cultivation no real monopoly. But although legal monopolies (apart from patents and the like) are not general, and in most countries the law is adverse to the creation of monopolies,[1] as a matter of fact in modern times there has been an increasing tendency to the amalgamation of businesses of all kinds into large combinations (trusts, kartells, &c.), which have the power of monopolies. In the same way in the relation of labour and capital the method of collective bargaining partakes of the character of monopoly. There may be *buyers'* as well as sellers' monopoly, and capitalistic combinations operate by this method in dealing with the production of raw material or other requisites and also with labour.

Mono-poly values.

Competition values.

The theory of monopolies being a case of the determination of *maxima* is essentially mathematical, and many of the problems, especially as regards the incidence of taxes and the benefits of the public acquisition of "natural" monopolies, can only be fully explained mathematically as by Marshall. In recent years great attention has been given to the realistic study of monopolies (J. W. Jenks, H. W. Macrosty, &c.; see TRUSTS). When competition arises, and is effective, exceptional profit ceases, and thus a new principle for determining values comes into play. If the producer of any article is obtaining more than the usual rate of profit, he at once provokes competition, and thus even the dread of this possible competition may keep down prices. This is often expressed by saying that the potential supply affects prices almost as much as the actual supply. It thus becomes obvious that, as regards freely produced commodities the production of which may be extended indefinitely at the same or at a decreasing cost, the value tends to conform to the minimum cost of production, and that any other value is consequently unstable. It will be observed, however, that cost of production only determines values by operating through the actual or potential supply, and thus that the law of demand and supply is fundamental. Once a thing is made, the actual cost of production has no influence on its value, except as indicating the conditions of future possible supply.

At this point it becomes necessary to analyse and explain the nature of cost of production. In the last resort it will be found that nothing can be produced without labour, and in a modern society capital must be added. Thus the component elements of production are labour and capital acting by natural forces upon raw material. But, since both the forces and the produce of nature require labour and capital for their exploitation, the elements that must be considered primary and fundamental in the case of commodities that can be indefinitely increased are labour and capital. Capital, again, is itself a product of labour, and it is also wealth set aside by the owner for future use instead

Cost of production.

[1] The general theory of monopolies was admirably treated by the French mathematician and economist Cournot, *Recherches sur les principes mathématiques de la théorie des richesses* (1838), and as far as possible without mathematics in the *Revue sommaire des doctrines économiques* (1877).

of for present consumption. Accordingly, in order that a thing may be continuously produced, labour must obtain a sufficient reward for toil, and capital a sufficient reward for "abstinence" or "waiting," or for preservation and accumulation of wealth. Thus the ultimate elements in the real cost of production are the toil and trouble and irksomeness of labour and of saving. But this toil and trouble will not be submitted to unless in any particular case the fair reward of industrial competition is forthcoming. However much pleasure a good workman may take in his work or a prudent man in his savings, in the industrial world as at present constituted both labour and capital will be attracted towards the point of highest reward (compare WAGES); and, accordingly, it is a necessary condition of the production of any article that the price obtained will yield the average rate of wages and profit obtainable for that species of work. Now these rates of wages and profit can be expressed in terms of money, and may be designated, following Marshall, the *expenses of production* as distinguished from the *real cost*. The real cost of production would on analysis consist of a confused unworkable mass of "efforts and abstinences," or "disutilities," and the relation of these mental strains to their material rewards is the problem of wages and profits. But for the purpose of relative values it is not necessary to push the analysis so far; and thus, if we regard the capitalist as the producer, we may look on the elements of production as consisting of wages and profits. And this is quite in accordance with customary thought and language: every one who asks for the details of the cost of a thing expects to have a statement of the wages and profits directly involved, and of the material, which again directly involves wages and profits. So far, then, as freely produced commodities are concerned, the general law is that they tend to sell at such a price as will yield on the average the ordinary rate of wages and profits which by industrial competition the occupation can command. It is at this point that the difficulty emerges as to the precise nature of the connexion between the prices of commodities and the money wages and profits of producers. Are we to consider that the former are determined by the latter, or the latter by the former? If, for example, commodity A sells for twice as much as commodity B, are we to say that this is because wages are higher in the former case, or are the wages higher because the price is higher? The answer to this question is given in the theory of WAGES (*q.v.*). It is sufficient to state here that, in discussing relative values, we may assume that industrial competition has established certain relative rates of wages and profits in various employments, and that any prices of articles which yielded more than these rates, whilst in other cases no corresponding rise took place, would be unstable. Thus, in discussing the normal values of freely produced commodities, we have to consider the quantity of labour and the rates of wages and the quantity of capital and the rate of profits, the *normal* rates of these wages and profits being given.

Expenses of production.

Wages and values.

The use of the term "normal" requires some explanation. The word *norma* properly refers to the square used by masons and carpenters, &c., and thus a thing may be said to be in its normal position when no change will be made: that is to say, the normal position is the stable position, or it is the position to which the workman will try to adjust his work. And, similarly, by the use of normal as applied to wages and profits, we mean the stable rate or the rate towards which they are attracted. It is thus quite possible that the normal rate may differ from the average rate or the rate obtained over a term of years. For it may easily happen that as regards wages, for example, a high rate for a short period may lead to such an increase in that kind of production that for a much longer period the rate will fall below the normal. The normal rate seems to refer to the actual conditions of industry, the rate which can be obtained for a given amount of exertion, taking the average of employments at the time, rather than to the particular rate obtained for some class of work over a period of years.

Normal value.

With these explanations the proposition holds good that the normal values of freely produced commodities tend to be equal to their cost, or rather expenses, of production, and any price which yields a greater or less return to labour and capital is unstable.

Marshall (*Principles of Economics*, bk. v. 5th ed., 1907) has treated very fully the subject of normal values and the relations of normal and market values from the side of theory; but the nature and importance of the distinction is perhaps best realized if we compare the normal relative values of important commodities over a period of centuries, as was done by Adam Smith and in the monumental work by Thorold Rogers on the *History of Agriculture and Prices*. At this stage in the analysis the difficulty must be met that even in a position of stable equilibrium, *i.e.* when the normal demand is just satisfied by the normal supply, the different portions of the aggregate supply may be produced at different costs according to differences in the natural environment or in the availability of different *factors of production*. In dealing with this difficulty the modern conception of *marginal cost* is of importance. If a commodity is produced at a uniform cost per unit whatever the amount, then the normal value depends simply on this uniform or normal cost; any temporary divergence in market prices will lead to a contraction or increase in the supply until the exceptional gains or losses are got rid of. It may happen, however, that portions of the supply can be obtained at different costs, and in this case the normal value is determined by the cost at the margin. It is this *marginal cost* which just gives the rates of remuneration to labour and capital which suffice to keep up the continuous supply of the requisite factors of production. If a commodity is produced according to the law of *diminishing return*, or, what is the same thing, if the supply can only be increased after a certain point at an increasing cost per unit, then the marginal portion just pays its expenses and the previous portions yield a differential remuneration which constitutes economic rent. If the conditions of difference in cost are natural and permanent we have the case of pure economic rent (see below), but if the factors of production in response to the stimulus of extra remuneration can be increased or improved the extra rates of remuneration tend to disappear with the increase in supply of the more advantageous factors, and instead of pure economic rent we have various species of *quasi*-rents. "Even the rent of land is seen not as a thing by itself but as the leading species of a large genus; though indeed it has peculiarities of its own which are of vital importance from the point of view of theory as well as of practice" (Marshall). Marshall has given special attention to the development of this application of the principle of continuity, of which Cournot was the first writer to realize the significance.

If a commodity is produced according to the law of *increasing return* (or diminishing cost per unit as the quantity is increased) the solution of the problem of normal value presents peculiar difficulties which cannot be treated in a preliminary survey. Two results, however, of practical importance may be noted. In the first, under increasing return the first established business can be expanded more easily than it is possible to start a new concern, and if new competing concerns are started there are obvious advantages in amalgamation, so that we arrive at the modern generalization that the natural tendency of increasing return production is to monopoly. This again gives the chief economic justification for "trusts"; it being said that through the adoption of various external and internal economies they more than neutralize the higher prices of monopoly.

The other result of importance is that under competition the less advantageous methods of production tend to be extruded and the law of increasing return gives way to that of constant return. For further consideration of these difficulties the reader may refer to the analysis by Marshall (*Principles of Economics*, bk. v. ch. xi.). The economic analysis of cost of production (or if we take the money measures of the various elements involved, expenses of production) involves a reference to the other great departments of economics, namely, production and distribution; and it is necessary to take account of the interconnexion and mutual dependence of these departments and that of exchange, in which the idea of value is predominant. In the last resort production will not be carried on unless labour and capital receive a sufficient reward and the sufficient reward is the normal value of the factors of production. But when we are comparing the relative values of commodities and are seeking to explain, for example, how it is that for long periods of time these relative values are stable, or conform to some regular law, we have to break up the elements of value into the constituents of the expenses of the various factors of production. This leads up to the analysis of cost (or expenses) of production as dependent on the amounts and qualities of the labour and capital required.

Elements of expenses of production.

If all commodities were produced directly by the expenditure of labour, and in such a way that capital need not be considered, as in the simple natural state of society taken by Ricardo, then the only element to consider in value would be the quantity of labour. And in a society of a more developed character, in which wages are paid, if we consider that the rate of wages is uniform, and that profits may be disregarded in comparison with wages, the quantity of labour is the most important consideration, and a fall in the relative value of any article can only take place through some economy of labour. But, as we approach more nearly to the actual constitution of modern industrial societies, we find serious differences in the rates of wages in different employments, the use of fixed capital becomes of greater importance, and in some cases the lapse of time necessary for the completion of the commodity is considerable. Thus interest and profits, as well as the differential rates of wages, have to be taken into account just as much as the quantity of labour, and it is generally convenient to consider also the established differences in various returns to capital under different conditions (risk, irregularity, &c.). Indirectly, of course, since all capital in the ordinary sense is the result of labour, the quantity of labour is always of primary importance; but, in considering the proximate causes of relative values, it is best to consider capital and labour as independent factors. It follows, then, that, in order to compare the relative values of two commodities, A and B, freely produced in a modern industrial society, we must take into account, first of all, the relative wages and relative profits, and the relative amounts of labour and capital employed. If the producers of A are skilled workmen, and if the return to the capital is uncertain, whilst in the case of B the labour is unskilled and profit steady, then the value of A will be higher than that of B, supposing each produced by the same amount of capital and the same quantity of labour. Obviously, too, any change in the relative wages and profits will affect the relative values. If the commodities considered are not capable of division into similar parts (such as yards of cloth or silk), but must be considered in their entirety (*e.g.* ships and houses), then we must take into account also the different quantities of labour and capital required for their completion, as well as the relative rates of wages and profits. As regards changes of value in this case, it will be observed that, if the proportions are different in which labour and capital are employed in the production of two commodities, then any change in the *general* rates of wages and profits will affect relative values. By making various suppositions as to changes in the different elements of the expenses of production, a great many cases may be obtained, as is done, for example, by Mill (*Pol. Econ.* bk. iii. ch. iv.).

General formula for expenses of production.

All the cases enumerated and others may, however, be deduced from a general formula. Let E_1 represent the total expenses of production of commodity A. Let Q_1 be the quantity of fixed capital employed, and let r_1 be the rate of wear and tear per annum, so that the loss is Q_1/r_1. Let P_1 be the rate of profits per cent. per annum which must be obtained on the whole capital. Let Q_2 be the number of labourers, and w_2 the rate of wages per annum. Let t_1 represent the time taken for production reckoned in years (t_1 may be less than unity, thus t_1/Q_2 would be weeks). Then the total expenses of production are

$$E_1 = \left\{ Q_1\left(\frac{P_1}{100} + \frac{1}{r}\right) + Q_2 \cdot w_2\left(1 + \frac{P_1}{100}\right) \right\} t_1.$$

This simply means that the commodity must return in the normal case profits on the fixed capital with repair of waste, and also the wages expended (the amount depending on the number of labourers and the rate of wages), with profit on the circulating capital over all the time necessary to complete production. In some cases, it may be observed, it would be necessary to take t differently for the fixed capital and the labour or circulating capital. Then, in a similar way E_2, the expenses of production of B, may be expressed:

$$E_2 = \left\{ Q_3\left(\frac{P_3}{100} + \frac{1}{r_3}\right) + Q_4 \cdot w_4\left(1 + \frac{P_3}{100}\right) \right\} t_2.$$

Changes in relative values.

Thus the relative values of A and B will be found by comparing the aggregate of these several elements expressed on the right-hand sides of the equations. It will now be evident on what a number of variable elements relative values must depend, even when we consider that the commodities can be indefinitely increased by the proper expenditure of capital and employment of labour. With the progress of invention and the development of industrial competition, constant changes are taking place in the various elements, and in the somewhat complicated formula given certain practical elements have been eliminated. Even if we suppose, for the sake of simplicity, that P_1 and P_3 are equal, as also w_2 and w_4 and t_1 and t_2—that is, if we suppose a uniform rate of wages and profits, and the same amount of time required—still any change in these *general* rates will affect relative values, owing to the different proportions in which fixed and circulating capital may be employed in the two cases. Thus, for example, we arrive at Mill's statement: "All commodities in the production of which machinery bears a large part, especially if the machinery is very durable, are lowered in their relative value when profits fall." And it will be found on trial that by making various suppositions as to the identity of certain of the elements, or as to their disappearance, many other causes of changes in relative values may be deduced. Two important practical conclusions of a general character may be drawn from this analysis. (1) Relative values are liable to constant disturbances, and accordingly, since relative prices tend to be adjusted to relative values, relative prices must be constantly changing. (2) It is extremely difficult to measure changes in the value of the monetary standard, or movements in the general level of prices, or variations in the purchasing power of money incomes.

Value and rent.

These difficulties are further increased by the importance of the group of commodities which can only be increased (the arts of production remaining the same) at an increasing cost, and which are placed by Mill under a third law of value. The most important examples of this law are agricultural and mining produce. In order to make the principles on which this law depends clear and intelligible, it is necessary to proceed at first by the abstract method. Assume then that there is an isolated country and that its agricultural produce consists of corn. Then at any given stage of the growth of wealth and population the amount of corn may be increased (the art of agriculture remaining stationary) either by taking into cultivation inferior lands or else by cultivating with greater care and expense the lands already in cultivation. But in either case what is known as the law of diminishing return would come into play, and the additional supply could only be obtained at an additional cost. It may be assumed that at any stage of development the cultivation would be carried to such a point as to give just the ordinary return to capital on the last "dose" of capital expended. Further it cannot be carried, for no farmer will work at a continuous loss; and competition will ensure that it is carried so far, for, if this last application of capital yields ordinary profit, the former "doses" must yield more, that is to say, rent as well as profit. It thus becomes manifest that, under the conditions supposed, the extent to which "the margin of cultivation" will extend depends upon the price of the produce, and in the normal case—The price must be equal to the expenses of production of that part which is produced under the most unfavourable circumstances. This then is the third law of value, from which the economic theory of rent is an immediate deduction. For, if the last dose obtains just a sufficient return, the former doses must yield more, and the sum of these extra profits is rent. It thus appears, also, that rent depends upon price and not price upon rent.

Qualifications of pure theory of rent.

The pure theory of rent is arrived at by making certain hypotheses and abstractions, and accordingly it must not be applied to particular practical cases without further consideration. The theory certainly indicates the effect of very important causes, but requires in practice a certain amount of qualification. (1) The essence of the theory is that the return to each dose of capital applied can be separated, and that the application of capital will cease when the last dose yields only ordinary profits; and no doubt it is roughly true to say that a farmer will discover on trial at what point he should cease applying capital, and that this will depend upon the price of the produce. At the same time, however, it is quite possible that a farmer who owns the land which he tills may find it advantageous to carry cultivation to a further pitch than if he only rented his land. For he will apply his own labour and capital at a less return on his own land. There can be little doubt that very many important improvements made by landowners have yielded less than the ordinary rate of profit, just as peasant proprietors obtain a poor return by way of wages for their own labour. A landowner cultivating his own land has the whole margin of economic rent to fall back upon, but a farmer has to pay his rent as a first charge. Thus it is possible, provided always that the land is cultivated in both cases with the same skill, that food would be cheaper if all the land were cultivated by the owner and not by tenants farming for a profit, and thus the fact that many American farmers pay no rent may account partially for the lower prices at which they sell their corn. (2) Again, the pure theory takes no account of the size of the portions into which the land is divided, nor of the kinds of crops which are grown. But, when most of the land of a country is rented, both of these factors have to be considered, and it may be more convenient to the landowner to let the land with certain restrictions, which again indirectly operate on the price. (3) It has been well observed by Passy[1] that the principal effect of various land laws is to increase or diminish the amount of the gross produce, which in Ricardian phraseology would mean to extend or contract the margin of cultivation. It thus appears that it is not always true to say that the payment of rent makes no real difference to the general public, and that it is simply a necessary method of equalizing farmers' profits. At the same time, however, with the necessary qualifications, there is no doubt that price determines rents, and not rent price, especially when prices are affected by foreign competition. In Great Britain a striking example has been afforded both of the abandonment of inferior lands (the contraction of the margin) and of a heavy fall in rent under the influence of falling prices.

Progress and rent.

The hypothetical history implied in Ricardo's theory as to the effects of the progress of society upon the value of agricultural produce also requires some criticism, such as that given by the historian of agriculture and prices, Thorold Rogers. The theory assumes that in the first place population increases, and thus there is a greater demand for food, and that therefore the margin of cultivation extends and the price rises, and rent rises also. But, as Rogers observes, history shows that agricultural improvements of all kinds have first of all increased the amount of food, and thus allowed of an increase in population. It is worth noticing that in our own times an increasing population in rural districts (*e.g.* the Highlands of Scotland and the west of Ireland) may indirectly tend to lower or destroy rents through minute subdivision. Ricardo's theory, however, accounts very well for the rise in the ground-rents of towns and cities, and it is there far more than in the rural districts that the unearned increment is to be found.

Value of mining produce.

The value of mining produce is determined generally in the same way as that of agricultural produce; but similar qualifications must be introduced. The theory is that both extensively and intensively the produce of mines is subject to the law of diminishing return, that the margin recedes as the price falls and extends as it rises, and that thus the price is determined by the most costly portion which it just pays to bring to market. The principal point to observe is that mines are gradually quite exhausted. In general the produce of mines is, like that of land, consumed in a comparatively short time, and thus the value is subject to fluctuations according to the conditions of the annual demand and supply.

Precious metals.

The peculiar durability of the precious metals, however, makes them in this respect differ widely from most mining produce. It is of course undeniable that (supposing coinage free) the value of standard coins will be equal to the value of the same amount of bullion, and, conversely, that the bullion will be equal in value to the same amount of coins. The older economists argued that the precious metals had their value determined by their cost of production under the most unfavourable circumstances, and then argued that in consequence the value of money (or coins) tended to be governed by the cost of production of bullion. If, however, it is remembered that the annual production does not probably amount to 2% of the quantity in the hands of man, that cost of production can only operate through actual or potential supply, and that in the case of money the increase must be real to affect prices, it will be readily seen that the value of bullion is determined by the general level of prices (or the value of money), and not that the value of money depends upon the value of the bullion. At the same time, however, it is true that, if prices become very high,—in other words, if the value of money, and thus of bullion, becomes very low,—then a check is placed upon production from the mines, and, conversely, with falling prices or a rise in the value of the precious metals mining for them is extended and encouraged. But the difference in the annual supply due to this influence will be small under present or similar conditions. On the whole, this case of the precious metals furnishes perhaps the best example of the way in which the cost of production can only act through the law of supply and demand.

Law governing value of joint products.

There is one other part of the general theory of value which requires some notice. Some articles can only be produced in conjunction with others (*e.g.* hides and beef, wool and mutton), and some modification of the theory is needed to suit this case. The law deduced is that—The sum of the values must be equal to the joint expenses of production, and the relative values *inter se* are determined by demand and supply. Thus the Australian sheep-farmers will extend their sheep-farms so long as for wool and mutton together they obtain a fair profit, but the amount contributed by each portion will be determined by the relative demand. It is interesting to observe that in the progress of society the value of the meat has risen as compared with that of the hides and the wool. The same principle determines the kind of produce which will be raised from land, though the application is rather more difficult owing to rotation of crops, &c.

Theory of international values.

Much discussion has taken place recently on the question whether a distinct theory of international values is required. In the limits assigned to this article it is only possible to indicate the principal points in dispute. The "orthodox" theory, as held by Ricardo, Mill and Cairnes, has been attacked by Cournot, Sidgwick and others, and has been re-stated with admirable clearness and much original power by C. F. Bastable.[2] The best way to answer the question seems to be to make clear the assumptions

[1] *Systèmes de culture en France.*

[2] *Theory of International Trade.*

on which the values of commodities produced within any "nation" are determined, and then to consider whether any change must be made when we bring in other nations. We are at once met with the difficulty, What is a "nation"? The orthodox answer appears to be that within any nation (for which the term "economic area" might perhaps be advantageously substituted) there is effective industrial and commercial competition. This appears to imply no more than is contained in the principle noticed above, that relative values tend to be equal to the normal expenses of production (*commercial* competition), and that the expenses tend to be proportioned to the real cost (*industrial* competition). The question then arises,

Comparative cost.

Do these conditions not exist in international trade? The answer appears to be, first, that commercial competition certainly holds good; for as soon as a trade is established the commodities will sell at the same prices in both countries (allowance being made for cost of carriage). It would plainly be absurd to say that the value of Manchester goods is determined by their expenses of production if they are consumed in England, but by something else if they are sent to India. If then there is any difference between domestic and international values, it must arise owing to the absence of effective industrial competition; that is to say, in the same country (or economic area) the real cost determines the expenses of production on account of the supposed perfect mobility of labour and capital, but between different economic areas these agents of production do not pass with sufficient readiness to secure a similar correspondence. It thus follows that a country may import articles which it could produce at less real cost, provided that it pays for these imports with exports which cost even less. A very striking example of this doctrine of *comparative cost*, as it is termed, was furnished by Victoria after the great gold discoveries. All kinds of produce were imported and paid for with gold, because there was less real cost involved in obtaining the gold to pay for imports than in making the articles. According to this theory every country will devote its labour and capital to its most productive uses; and, if by some new imports a domestic industry is checked or abolished, it is argued that the labour and capital will be devoted to increasing the exports so as to pay for the new imports. It must clearly be assumed as axiomatic that in the absence of loans, tributes, &c., imports can in the long run only be paid for by exports, and also that those articles will be exported which can be produced at the least comparative real cost. This theory then may be held to explain in a satisfactory manner the origin and development of international *trade*; but the question of *values* is still un-

Reciprocal demand.

determined. Consistently with exports paying for imports many different rates of exchange are possible, and the particular rate actually adopted is said to depend entirely on reciprocal demand. And in an extreme case, in which new countries trade solely in articles of which each has a monopoly, this answer would seem to be correct; but, when we consider that under present conditions trading countries have many articles in common, and that a slight margin of profit suffices to expand or diminish an export trade, this answer seems too vague and unreal. In general

Foreign exchanges.

it is clear that the rate will be determined independently of the foreign trade, or at least that the foreign trade is only one factor to be considered. If the rate of profit falls, a trade which before was impossible becomes possible. The opinion may be hazarded that the best way of explaining the general theory of international values would be to start with the foreign exchanges; but such an investigation is too technical and difficult for this place (see Exchange).

See J. S. Nicholson's *Principles of Political Economy*, vol. ii. book iii. ch. 25–28, for the development of this line of criticism of the Ricardian theory; and C. F. Bastable's *Theory of International Trade* (Appendix) for reply to this and other criticisms. (J. S. N.)

VALVE (Lat. *valva*, a leaf of a double or folding door, allied to *volvere*, to roll, as of a door on its hinges), a term applied to many mechanical appliances, devices or natural features, which control, by opening and shutting, the flow of air, liquids, vapour, gas, &c., through a passage, tube, pipe or other vessel.

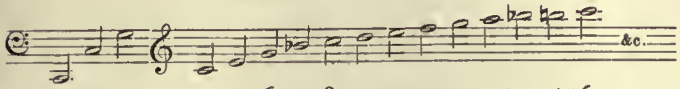
VALVES, or Pistons (Fr. *pistons, cylindres*; Ger. *Ventile*; Ital. *pistoni*), in music, mechanical contrivances applied to wind instruments in order to establish a connexion between the main tubing and certain supplementary lengths required for the purpose of lowering the pitch. Various devices have been tried from the days of ancient Greece and Rome to produce this effect, the earliest being the additional tubes (*πλάγιαι ὁδοί*) inserted into the lateral holes of the aulos and tibia in order to prolong the bore and deepen the pitch of each individual hole; these tubes were stopped by the fingers in the same manner as the holes. This device enabled the performer to change the mode or key in which he was playing, just as did the crooks many centuries later. But the resourcefulness of the ancients did not stop there. The tibiae found at Pompeii (see Aulos) had sliding bands of silver, one covering each lateral hole in the pipe; in the band were holes (sometimes one large and one small, probably for semitone and tone) corresponding with those on the pipe. By turning the band the holes could be closed, as by keys when not required. By fixing the *ὁδοί* in the holes of the bands, the bore was lengthened instantly at will, and just as easily shortened again by withdrawing them; this method was more effective than the use of the crooks, and foreshadowed the valves of eighteen centuries later. The crooks, or coils of tubing inserted between the mouthpiece and the main tube in the trumpet and horn, and between the slide and the bell joint in the trombone, formed a step in this direction.

Although the same principle underlies all these methods, *i.e.* the lengthening of the main column of air by the addition of other lengths of tubing, the valve itself constitutes a radical difference, for, the adjustment of crooks demanding time and the use of both hands, they could only be effective for the purposes of changing the key and of rendering a multiplicity of instruments unnecessary. The action of the valve being as instantaneous as that of the key, the instrument to which it was applied was at once placed on a different basis; it became a chromatic instrument capable of the most delicate modulations from key to key. The slide had already accomplished this desirable result, but as its application was limited to instruments of which the greater part of the bore was cylindrical, *i.e.* the trumpet and trombone, its influence on concerted musical composition could not be far-reaching. In fact it is doubtful whether the chromatic possibilities of the slide were fully realized until the end of the 18th century, when key mechanism having made some advance, it was being applied successfully to the transverse flute and to the clarinet and oboe families. In 1760 Kölbel, a Bohemian horn-player engaged in the St Petersburg Imperial Orchestra, turned his attention to this method of extending the compass of brass instruments. His experiments, followed up by Anton Weidinger of Vienna at the beginning of the 19th century, produced a trumpet with five keys and a complete chromatic compass. Halliday followed with the keyed bugle in 1810. Halary applied the principle of the keyed bugle to the bass horn in 1817, and produced the ophicleide—an ideal chromatic bass as far as technical possibilities were concerned. The horn had become a chromatic instrument through Hampel's discovery of *bouché* sounds, but the defects in intonation and timbre still remained.

Such were the conditions prevailing among the wind instruments of the orchestra when the successful application of the valve to brass wind instruments by Heinrich Stölzel of Silesia caused an instantaneous revolution among makers of wind instruments. Further efforts to perfect the key system as applied to the brass wind were abandoned in favour of valves. The short space of two decades witnessed the rise of the Flügelhorns, the tubas, the saxhorns and the cornet-à-pistons; the trombone, French horn and trumpet having led the van.

Sound is produced on brass wind instruments by overblowing the members of the harmonic series (see Horn). The harmonic series itself is invariable, whether obtained from a string or a column of air; the structural features of the instrument determine which members of the series it is able to produce.

Harmonic Series in C



1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16

Although the valves of brass wind instruments vary in form and detail according to the makers, the general principles governing their action are the same for all types. The piston placed on some branch of the main tube must be so constructed that on being depressed it closes the natural windways through the main bore and opens others into the additional piston length. The piston seated on a spring instantly regains its normal position when the finger is removed. After the actual shape and construction of the valve and its box had been successfully evolved, it was the boring and disposition of the windways which engaged the attention of makers, whose object was to avoid complexity and sharp angles and turns in the tubing. The pitch of all tubes is determined by the length of the column of air set in vibration therein. Any variation in the length of this column of air produces a proportional variation in the pitch of the instrument. When the piston is depressed, therefore, a partition wall is removed and the column of air within the additional length of tubing representing a definite interval is added to the main column, so that the length of the sound wave is proportionally increased whether the column is vibrating as a whole (when it gives the fundamental or first note of the series) or whether it has been induced to divide into equal portions in which sound waves of equal length are simultaneously generated. The numbers under the notes of the harmonic series represent the aliquot parts into which the column of air must divide in order to produce the harmonics. The length of tubing attached to each valve is therefore calculated on the basis of the length of the main column, to give for the first piston a tone, for the second a semitone, for the third a tone and a half, and for the fourth two tones.

In order to illustrate the working of the pistons, we will take as an example the bombardon or bass tuba in E♭. Depressing the second piston lowers the pitch of the instrument to D, giving it the harmonic series proper to that key; the third harmonic, which on the open tube would be B♭, now becomes A; the fifth harmonic, which was G, is now F♯, and so on. The first piston on being depressed similarly transforms the E♭ bombardon into an instrument in D♭, a tone lower; the third piston lowering the pitch 1½ tones changes the key to C. So far the intonation of the notes produced by means of the pistons is as accurate as that of the harmonics. The variations in the length of the column of air correspond to the positions of the slide on the trombone, the first position being that of the instrument with all valves in their normal position. The use of the three pistons in turn gives the second, third and fourth positions. In order to obtain a complete chromatic compass there must be seven positions or different lengths of tubing available, as on the trombone, each having its proper harmonic series. On valve instruments the three other positions are obtained by means of combinations of pistons; the fifth position consists of a combination of pistons 2 and 3 (½ and 1½ tones), which would transpose our bombardon into the key of B; the sixth position consists of a combined use of pistons 1 and 3, producing a drop in pitch of 2½ tones from E♭ to B♭. In the seventh position all three pistons come into play simultaneously, lowering the pitch three tones. The intonation of the notes obtained in positions 5, 6, 7 is not so faultless as that of notes from the other positions, for the following reason:—On the bombardon in E♭ piston 1 lowers the pitch one tone to D♭; in the sixth position, when pistons 1 and 3 are used simultaneously, the third piston is no longer attached to a bombardon in E♭, on which it would produce the effect of C, but to one in D♭, on which it lowers the pitch to B♭; it is clear, therefore, that the supplementary tubing will not be quite long enough to give the correct intonation, and that the B♭ obtained as the 2nd harmonic in the sixth position will be a little too sharp, a defect which the performer corrects as best he can with his lip. The exact differences in length can be found from the table of ratios given by Victor Mahillon in *La Trompette, son histoire, sa théorie, sa construction* (Brussels and London, 1907), p. 38.

This inherent defect of the valve system was understood and explained a few years after the invention of valves by Gottfried Weber,[1] and the record of the successive endeavours of brass instrument makers to overcome this defect without unduly complicating the mechanism or adding greatly to the weight of the instruments constitutes the history of valve-instruments.

The accredited inventor and patentee of valves applied to musical instruments was Heinrich Stölzel[2] of Pless in Silesia in 1815. The credit, however, is really due to Blümel,[3] also a Silesian, who sold his rights to Stölzel.

[1] *Caecilia* (Mainz, 1835), xvii. 89–91.

[2] See Captain G. B. Bierey in *Allg. musik. Ztg.* (Leipzig, 1815), p. 309, and idem for patent 1817, p. 814.

[3] Ibid. 1818, p. 531.

The first valves made by Stölzel worked in large square brass boxes and consisted of square blocks of solid brass through which the windways were bored in the same horizontal plane. A trumpet having two valves of this make is preserved in the museum of the Brussels Conservatoire (No. 1310 in catalogue). In 1825 Stölzel had improved upon this primitive valve, making it tubular and calling it *Schub-Ventil*: its action was lighter and more rapid than that of the original valve. Charles Sax of Brussels took up the manufacture of these valves and applied them to the cornet with two pistons. The scale of instruments with only two pistons had several gaps, and could not be strictly termed chromatic. In order to complete the scale, C. A. Müller of Mainz constructed a trumpet in the early 'thirties which not only had three valves, but also tuning-slides for all three additional lengths of tubing[4] and key crooks, for which corresponding piston lengths could be inserted. This was, therefore, the first attempt at compensation, for which the honour is due to Germany.

The early improvements and modifications of Stölzel's invention may be briefly[5] summed up as follows:—

In 1824 John Shaw, of Glossop, invented a system of valves known as transverse spring slides, both ascending and descending, *i.e.* respectively having pistons which cut off certain lengths of tubing, thereby raising the pitch, or pistons adding certain lengths, and lowering the pitch thereby. These transverse slides were afterwards improved by Schott in 1830, and became known as the *Wiener Ventil*, which had an enormous success on the continent of Europe, and were applied to all kinds of brass instruments. In 1827 Blümel invented the rotary valve or cylinder action known as *Dreh* or *cylinder Ventil*, a system still in use in Germany and Austria, and preferred to piston systems by many.

In 1833 J. G. Moritz (who was associated with Wieprecht, inventor of the batyphone and bass tuba) made the large pistons of generous diameter known as *Berliner Pumpen*. In 1835 John Shaw patented a variation of the rotary valve, known as *patent lever*. In 1839 Périnet of Paris invented the most modern form of valve, called by his name, similar to the Schub-Ventil and Berliner Pumpen, but of a diameter between the two. In 1851 and 1852 Dr J. P. Oates made his equilateral valves adopted by Antoine Courtois for his cornets; the same clever acoustician invented a piston with four straight windways, afterwards patented by A. Sax of Paris.

Various attempts to improve the windways and get rid of angularities were made by Gustave Besson in 1851, 1854 and 1855, when a system was devised having the same bore throughout the windways. This decided improvement forms the basis of the present system of the same firm. Until now efforts had mainly been directed towards the improvement of the technical construction of valves and windways. The first attempt since Müller's (which appears to have passed unnoticed in France and England) to remedy by compensation the inherent defect of the valve system when pistons are used in combination was made in 1850, when Adolphe Sax devised a system of six pistons, one for each position, in which it was impossible to use any two pistons in combination: this system was ascending instead of descending. Gustave Besson's *registre* in 1856–57 followed, providing a large horizontal piston, which, by connecting other duplicate lengths of tubing of the proper theoretical length, gave eight independent positions. In 1858 G. Besson and Girardin produced the *transpositeur*, in which two extra pistons when depressed automatically lengthened the slides of the three usual pistons to the required length for combination. In 1859 came the first suggestion for automatic compensation made by Charles Mandel in his book on the *Instrumentation of Military Bands*, p. 39. It does not appear that he put his suggestion into practice or patented it. In this ingenious system the valves were so constructed that when two or three pistons were used simultaneously the length of tubing thrown open was automatically adjusted to the correct theoretical length required. The same ingenious principle, elaborated and admirably carried out in practice, was patented by D. J. Blaikley in 1878. The working of his device differs from the action of ordinary valves only when the pistons are used in combination. The exact theoretical length is then obtained by bringing into use extra compensating lengths of tubing corresponding to the difference between the piston length for a semitone, a tone and one and a half tones on the open tube and on the tube already lengthened by means of one of the other pistons. The value of this invention, enhanced by the advantage of leaving the fingering unaltered, is more especially appreciated on the large brass instruments, in which correction of faulty intonation by means of the lips is more difficult to accomplish satisfactorily than on the smaller instruments. A similar device was patented in France in 1881 by Sudre.

Victor Mahillon, who had been for some years at work on similar lines, did not patent his invention till 1886, when his *piston*

[4] Gottfried Weber, *op. cit.* p. 98.

[5] Fuller accounts may be derived from Captain C. R. Day, *Descriptive Catalogue of Musical Instruments* (London, 1891), pp. 182 seq.; Victor Mahillon, *Catalogue descriptif*, vol. i. 2nd ed. pp. 282 seq.; and from the pages of the *Allg. musik. Ztg.* (Leipzig) and *Caecilia* (Mainz).

régulateur was introduced: this first device was not automatic, and was shortly afterwards improved and patented as the *automatic regulating pistons.*

A later valuable development in the history of valve systems is the *enharmonic*, invented by Messrs Besson & Co., in which they have perfected and simplified the principle of independent positions tried in the *registre* of the fifties. In the enharmonic valve system each position has its independent length of tubing theoretically accurate, which comes into play as the valves are depressed, and there is besides a tuning slide for the open notes.

Finally, there is an improvement in a different direction to be chronicled, unconnected with compensation, in Rudall Carte & Co.'s system (Klussmann's patent) of conical bore throughout, the open tube and the valve slides, which by means of ingeniously combined joints and slides preserve the tone without loss of air. This system has been applied to all valve instruments, and has been found to produce a remarkable improvement in the timbre. (K. S.)

VALYEVO (sometimes written Valjevo or Valievo), a town of western Servia, prettily situated on the river Kolubara, in a well-wooded valley, 627 ft. above the sea. Valyevo gives its name to the department of which it is the capital. It is a garrison town, with streets lighted by electricity, a high-school or gymnasium, a prefecture and a court of first instance. In the neighbouring Medvenik mountains lead-mining and smelting are carried on by an English company; lead and antimony being also worked at Podgora and other places in the same department. Besides being the centre of the plum-growing and distilling industries, Valyevo has a considerable trade in cattle, for which the pastures watered by the Kolubara are celebrated. Pop (1900) about 6800.

VÁMBÉRY, ÁRMIN (1832–), Hungarian Orientalist and traveller, was born of humble parentage at Duna-Szerdahely, a village on the island of Shütt, in the Danube, on the 19th of March 1832. He was educated at the village school until the age of twelve, and owing to congenital lameness had to walk with crutches. At an early age he showed remarkable aptitude for acquiring languages, but straitened circumstances compelled him to earn his own living. After being for a short time apprentice to a ladies' tailor, he became tutor to an innkeeper's son. He next entered the untergymnasium of St Georgen, and proceeded thence to Pressburg. Meanwhile he supported himself by teaching on a very small scale, but his progress was such that at sixteen he had a good knowledge of Hungarian, Latin, French and German, and was rapidly acquiring English and the Scandinavian languages, and also Russian, Servian and other Slavonic tongues. At the age of twenty he had obtained sufficient knowledge of Turkish to lead him to go to Constantinople, where he set up as teacher of European languages, and shortly afterwards became a tutor in the house of Pasha Hussein Daim. Under the influence of his friend and instructor, the Mollah Ahmed Effendi, he became, nominally at least, a full Osmanli, and entering the Turkish service, was afterwards secretary to Fuad Pasha. After spending six years in Constantinople, where he published a *Turkish-German Dictionary* and various linguistic works, and where he acquired some twenty Oriental languages and dialects, he visited Teheran; and then, disguised as a dervish, joined a band of pilgrims from Mecca, and spent several months with them in rough and squalid travel through the deserts of Asia. He succeeded in maintaining his disguise, and on arriving at Khiva went safely through two audiences of the khan. Passing Bokhara, they reached Samarkand, where the emir, whose suspicions were aroused, kept him in audience for a full half-hour; but he stood the test so well that the emir was not only pleased with "Resid Effendi" (Vámbéry's assumed name), but gave him handsome presents. He then reluctantly turned back by way of Herat, where he took leave of the dervishes, and returned with a caravan to Teheran, and subsequently, in March 1864, through Trebizond and Erzerúm to Constantinople. By the advice of Prokesch-Osten and Eötvös, he paid a visit in the following June to London; there his daring adventures and linguistic triumphs made him the lion of the day. In the same year he published his *Travels in Central Asia.* In connexion with this work it must be remembered that Vámbéry could write down but a few furtive notes while with the dervishes, and dared not take a single sketch; but the weird scenes, with their misery and suffering, were so strongly impressed on his memory that his book is convincing by its simplicity, directness and evidence of heroic endurance. Vámbéry also called the attention of politicians to the movements of Russia in Central Asia, and aroused much general interest in that question. From London he went to Paris, and he notes in his *Autobiography* that the Parisians were much more interested in his strange manner of travelling than in the travels themselves. He had an interview with Napoleon III., who failed to impress him "as the great man which the world in general considers him." Returning to Hungary, he was appointed professor of Oriental languages in the university of Budapest: there he settled down, contributing largely to periodicals, and publishing a number of books, chiefly in German and Hungarian. His travels have been translated into many languages, and his *Autobiography* was written in English. Amongst the best known of his works, besides those alluded to, are *Wanderings and Adventures in Persia* (1867); *Sketches of Central Asia* (1868); *History of Bokhara* (1873); *Manners in Oriental Countries* (1876); *Primitive Civilization of the Turko-Tatar People* (1879); *Origin of the Magyars* (1882); *The Turkish People* (1885); and *Western Culture in Eastern Lands* (1906).

VAMPIRE, a term, apparently of Servian origin (*wampir*), originally applied in eastern Europe to blood-sucking ghosts, but in modern usage transferred to one or more species of blood-sucking bats inhabiting South America.

In the first-mentioned meaning a vampire is usually supposed to be the soul of a dead man which quits the buried body by night to suck the blood of living persons. Hence, when the vampire's grave is opened, his corpse is found to be fresh and rosy from the blood which he has thus absorbed. To put a stop to his ravages, a stake is driven through the corpse, or the head cut off, or the heart torn out and the body burned, or boiling water and vinegar are poured on the grave. The persons who turn vampires are generally wizards, witches, suicides and those who have come to a violent end or have been cursed by their parents or by the church. But any one may become a vampire if an animal (especially a cat) leaps over his corpse or a bird flies over it. Sometimes the vampire is thought to be the soul of a living man which leaves his body in sleep, to go in the form of a straw or fluff of down and suck the blood of other sleepers. The belief in vampires chiefly prevails in Slavonic lands, as in Russia (especially White Russia and the Ukraine), Poland and Servia, and among the Czechs of Bohemia and the other Slavonic races of Austria. It became specially prevalent in Hungary between the years 1730 and 1735, whence all Europe was filled with reports of the exploits of vampires. Several treatises were written on the subject, among which may be mentioned Ranft's *De masticatione mortuorum in tumulis* (1734) and Calmet's *Dissertation on the Vampires of Hungary*, translated into English in 1750. It is probable that this superstition gained much ground from the reports of those who had examined the bodies of persons buried alive though believed to be dead, and was based on the twisted position of the corpse, the marks of blood on the shroud and on the face and hands—results of the frenzied struggle in the coffin before life became extinct. The belief in vampirism has also taken root among the Albanians and modern Greeks, but here it may be due to Slavonic influence.

Two species of blood-sucking bats (the only species known)—*Desmodus rufus* and *Diphylla ecaudata*—representing two genera (see CHIROPTERA), inhabit the tropical and part of the subtropical regions of the New World, and are restricted to South and Central America. They appear to be confined chiefly to the forest-clad parts, and their attacks on men and other warm-blooded animals were noticed by some of the earliest writers. Thus Peter Martyr (Anghiera), who wrote soon after the conquest of South America, says that in the Isthmus of Darien there were bats which sucked the blood of men and cattle when asleep to such a degree as to even kill them. Condamine, a writer of the 18th century, remarks that at Borja (Ecuador) and in other places they had entirely destroyed the cattle introduced by the missionaries. Sir Robert Schomburgk relates that at Wicki, on the river Berbice, no fowls could be kept on account of the ravages of these creatures, which attacked their combs, causing them to appear white from loss of blood. The present writer, when in South and Central America, had many accounts given him as to the attacks of the vampires, and it was agreed upon by most of his informants that these bats when attacking horses showed a decided preference for those of a grey colour. It is interesting to speculate how far the vampire bats may have been instrumental—when they were, perhaps, more abundant—in causing the destruction of the horse, which had disappeared from America previous to the discovery of that continent.
